Division of Mining and Reclamation: eDMR- Alternate Limit Codes & Average pH Reporting

west virginia department of environmental protection

In order to address eDMR program coding being mis-read by the EPA ICIS database, the following coding will be required on both File Upload and Manual Entry eDMRs:

- On NPDES permits with Alternate Effluent Limits (such as Alternate Storm Limits for Total Suspended Solids vs. Settleable Solids) begin using the code, “Conditional Monitoring” at the parameter level for the Alternate Limit that is NOT being report for that period.
- In many existing NPDES permits, the effluent limit for Average pH is shown as Report Only. Starting with the third calendar quarter of 2018 if there is an Average pH shown as Report Only, on any permit, please place the arithmetic average of the Minimum and Maximum pH for that monitoring period. This will stop the absence of a value, in this field, as being shown as a violation in the EPA ICIS system.

- The choice of Report Only for pH Average Limit will not be available for future permitting actions. This should help solve this problem in the future. We are working on a programming solution for all existing permits.

If you have any questions, please contact John Vernon at (304) 926-0499 extension 1482.
