TITLE 45
LEGISLATIVE RULE
DEPARTMENT OF ENVIRONMENTAL PROTECTION
AIR QUALITY

SERIES 34
EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS

§45-34-1. General.

1.1. Scope. -- This rule establishes and adopts a program of national emission standards for hazardous air pollutants and other regulatory requirements promulgated by the United States Environmental Protection Agency pursuant to 40 C.F.R. parts 61, 63 and section 112 of the federal Clean Air Act, as amended. This rule codifies general procedures and criteria to implement emission standards for stationary sources that emit (or have the potential to emit) one or more of the eight substances listed as hazardous air pollutants in 40 C.F.R. § 61.01(a), or one or more of the substances listed as hazardous air pollutants in section 112(b) of the CAA. The Secretary hereby adopts these standards by reference. The Secretary also adopts associated reference methods, performance specifications and other test methods which are appended to these standards.

1.2. Authority. -- W.Va. Code § 22-5-4.

1.3. Filing Date. -- ~~April 28, 2021~~.

1.4. Effective Date. -- ~~June 1, 2021~~.

1.5. Sunset Provision. -- Does not apply.

1.6. Incorporation by Reference. -- Federal Counterpart Regulation. The Secretary has determined that a federal counterpart regulation exists, and in accordance with the Secretary's recommendation, with limited exception, this rule incorporates by reference 40 C.F.R. parts 61, 63 and 65, to the extent referenced in 40 C.F.R. parts 61 and 63, effective June 1, ~~2020~~2021.

§45-34-2. Definitions.

2.1. "Administrator" means the Administrator of the United States Environmental Protection Agency or his or her authorized representative.

2.2. "Clean Air Act" ("CAA") means the federal Clean Air Act, as amended, 42 U.S.C. § 7401, et seq.

2.3. "Hazardous air pollutant" means any air pollutant listed pursuant to 40 C.F.R. § 61.01(a) or § 112(b) of the CAA.

2.4. "Secretary" means the Secretary of the Department of Environmental Protection or other person to whom the Secretary has delegated authority or duties pursuant to W.Va. Code §§ 22-1-6 or 22-1-8.

2.5. Other words and phrases used in this rule, unless otherwise indicated, shall have the meaning ascribed to them in 40 C.F.R. Parts 61 and 63. Words and phrases not defined therein shall have the meaning given to them in federal Clean Air Act.

§45-34-3. Requirements.

3.1. No person may construct, reconstruct, modify, or operate, or cause to be constructed, reconstructed, modified, or operated any source subject to the provisions of 40 C.F.R. Parts 61 and 63 which

results or will result in a violation of this rule.

3.2. No person may construct or reconstruct any major source of hazardous air pollutants, unless the Secretary determines that the maximum achievable control technology emission limitation under 40 C.F.R. Part 63 and this rule for new sources will be met.

3.3. The Secretary shall determine and apply case-by-case maximum achievable control technology standards to existing sources categorized by the Administrator pursuant to § 112(c)(1) of the CAA for which the Administrator has not promulgated emission standards in accordance with §§ 112(d) and 112(e) of the CAA.

3.4. Prior to constructing, reconstructing or modifying any facility subject to this rule, the owner or operator shall obtain a permit in accordance with the applicable requirements of 45CSR13, 45CSR14, 45CSR19, 45CSR30 and this rule.

§45-34-4. Adoption of standards.

4.1. The Secretary hereby adopts and incorporates by reference the provisions of 40 C.F.R. Parts 61, 63 and 65, to the extent referenced in 40 C.F.R. Parts 61 and 63, including any reference methods, performance specifications and other test methods which are appended to these standards and contained in 40 C.F.R. Parts 61, 63 and 65, effective June 1, ~~2020~~2021, for the purposes of implementing a program for emission standards for hazardous air pollutants, except as follows:

4.1.a. 40 C.F.R. §§ 61.16 and 63.15 are amended to provide that information shall be available to the public in accordance with W.Va. Code §§ 22-5-1 et seq., 29B-1-1 et seq., and 45CSR31;

4.1.b. Subpart E of 40 C.F.R. Part 63 and any provision related to § 112(r) of the CAA, notwithstanding any requirements of 45CSR30 shall be excluded;

4.1.c. Subparts DDDDDD, LLLLLL, OOOOOO, PPPPPP, QQQQQQ, TTTTTT, WWWWW, ZZZZZ, HHHHHH, BBBBBB, CCCCCC, WWWWWW, XXXXXX, YYYYYY, ZZZZZZ, BBBBBBB, CCCCCCC, and DDDDDDD of 40 C.F.R. Part 63 shall be excluded; and

4.1.d. Subparts B, H, I, K, Q, R, T, and W; Methods 111, 114, 115 and Appendix D and E of 40 C.F.R. Part 61 shall be excluded.

§45-34-5. Secretary.

5.1. Any and all references in 40 C.F.R. Parts 63 and 65 to the "Administrator" are amended to be the "Secretary" except as follows:

5.1.a. Where the federal regulations specifically provide that the Administrator shall retain authority and not transfer authority to the Secretary;

5.1.b. Where provisions occur which refer to:

5.1.b.1. Alternate means of emission limitations;

5.1.b.2. Alternate control technologies;

5.1.b.3. Innovative technology waivers;

5.1.b.4. Alternate test methods;

5.1.b.5. Alternate monitoring methods;

5.1.b.6. Waivers/adjustments to recordkeeping and reporting;

5.1.b.7. Emissions averaging;

5.1.b.8. Applicability determinations; or

5.1.c. Where the context of the regulation clearly requires otherwise.

§45-34-6. Permits.

6.1. Nothing contained in this rule shall be construed or inferred to mean that permit requirements in accordance with applicable rules shall in any way be limited or inapplicable.

§45-34-7. Inconsistency between rules.

7.1. In the event of any inconsistency between this rule and any other rule of the Division of Air Quality, the inconsistency shall be resolved by the determination of the Secretary and the determination shall be based upon the application of the more stringent provision, term, condition, method or rule.

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 63

[EPA–HQ–OAR–2018–0415; FRL–10006–76–OAR]

RIN 2060–AU23

National Emission Standards for Hazardous Air Pollutants: Cellulose Products Manufacturing Residual Risk and Technology Review

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action finalizes the residual risk and technology review (RTR) conducted for the Miscellaneous Viscose Processes and Cellulose Ether Production source categories regulated under the National Emission Standards for Hazardous Air Pollutants (NESHAP) for Cellulose Products Manufacturing. The EPA is finalizing the proposed determination that the risks from both source categories are acceptable and that the current NESHAP provides an ample margin of safety to protect public health. The EPA identified no new cost-effective controls under the technology review to achieve further emissions reductions. These final amendments address emissions during startup, shutdown, and malfunction (SSM) events; add electronic reporting requirements; add provisions for periodic emissions performance testing for facilities using non-recovery control devices; add a provision allowing more flexibility for monitoring of biofilter control devices; and make technical and editorial changes. Although these amendments are not expected to reduce emissions of hazardous air pollutants (HAP), they will improve monitoring, compliance, and implementation of the rule.

DATES: This final rule is effective on July 2, 2020. The incorporation by reference (IBR) of certain publications listed in the rule is approved by the Director of the Federal Register as of July 2, 2020.

ADDRESSES: The U.S. Environmental Protection Agency (EPA) has established a docket for this action under Docket ID No. EPA–HQ–OAR–2018–0415. All documents in the docket are listed on the *https://www.regulations.gov/* website. Although listed, some information is not publicly available, *e.g.,* Confidential Business Information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *https://www.regulations.gov/,* or in hard copy at the EPA Docket Center, WJC West Building, Room Number 3334, 1301 Constitution Ave. NW, Washington, DC. The Public Reading Room hours of operation are 8:30 a.m. to 4:30 p.m. Eastern Standard Time (EST), Monday through Friday. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the EPA Docket Center is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: For questions about this final action, contact Dr. Kelley Spence, Sector Policies and Programs Division (E143–03), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–3158; fax number: (919) 541–0516; and email address: *spence.kelley@epa.gov.* For specific information regarding the risk modeling methodology, contact Mr. James Hirtz, Health and Environmental Impacts Division (C539–02), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–0881; fax number: (919) 541–0840; and email address: *hirtz.james@epa.gov.* For information about the applicability of the NESHAP to a particular entity, contact Ms. Maria Malave, Office of Enforcement and Compliance Assurance (2227A), U.S. Environmental Protection Agency, WJC South Building, 1200 Pennsylvania Ave. NW, Washington, DC 20460; telephone number: (202) 564–7027; and email address: *malave.maria@epa.gov.*

SUPPLEMENTARY INFORMATION:

Preamble acronyms and abbreviations. We use multiple acronyms and terms in this preamble. While this list may not be exhaustive, to ease the reading of this preamble and for reference purposes, the EPA defines the following terms and acronyms here:

%R percent recovery
ASTM American Society for Testing and Materials
CAA Clean Air Act
CDX Central Data Exchange
CEDRI Compliance and Emissions Data Reporting Interface
CEMS continuous emission monitoring system
CEP Cellulose Ethers Production
CFR Code of Federal Regulations
CMC carboxymethyl cellulose
CPMS continuous parameter monitoring system
CS_2 carbon disulfide
EPA Environmental Protection Agency
ERPG Emergency Response Planning Guideline
FTIR Fourier Transform Infrared

VOC volatile organic compounds

Background information. The EPA is finalizing the September 9, 2019, proposed determinations regarding the Cellulose Products Manufacturing NESHAP RTR and the proposed revisions to this NESHAP to address emissions during SSM events and to improve monitoring, compliance, and implementation. We summarize some of the more significant comments received regarding the proposed rule and provide our responses in this preamble. A summary of the public comments on the proposal not discussed in this preamble and the EPA's responses to those comments is available in the memorandum titled *National Emissions Standards for Hazardous Air Pollutants: Cellulose Products Manufacturing (40 CFR part 63, subpart UUUU) Residual Risk and Technology Review, Final Amendments—Response to Public Comments on September 9, 2019 Proposal,* Docket ID No. EPA–HQ–OAR–2018–0415. A ''track changes''

version of the regulatory language that incorporates the changes in this action is available in the docket.

Organization of this document. The information in this preamble is organized as follows:

I. General Information
A. Does this action apply to me?
B. Where can I get a copy of this document and other related information?
C. Judicial Review and Administrative Reconsideration
II. Background
A. What is the statutory authority for this action?
B. What is the source category and how does the NESHAP regulate HAP emissions from the source category?
C. What changes did we propose for the Cellulose Products Manufacturing NESHAP in our September 9, 2019, proposal?
III. What is included in this final rule?
A. What are the final rule amendments based on the risk review for the source category?
B. What are the final rule amendments based on the technology review for the source category?
C. What are the final rule amendments addressing emissions during periods of SSM?
D. What other changes have been made to the NESHAP?
E. What are the effective and compliance dates of the standards?
IV. What is the rationale for our final decisions and amendments for the source category?
A. Residual Risk Review
B. Technology Review
C. Removal of the SSM Exemption
D. Five-Year Periodic Emissions Testing
E. Electronic Reporting
F. Changes to the Monitoring Requirements for Biofilter Control Devices
G. IBR Under 1 CFR Part 51 for the Cellulose Products Manufacturing NESHAP
H. Technical and Editorial Changes for the Cellulose Products Manufacturing NESHAP
V. Summary of Cost, Environmental, and Economic Impacts and Additional Analyses Conducted
A. What are the affected facilities?
B. What are the air quality impacts?
C. What are the cost impacts?
D. What are the economic impacts?
E. What are the benefits?
F. What analysis of environmental justice did we conduct?
G. What analysis of children's environmental health did we conduct?
VI. Statutory and Executive Order Reviews
A. Executive Orders 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review
B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs
C. Paperwork Reduction Act (PRA)
D. Regulatory Flexibility Act (RFA)
E. Unfunded Mandates Reform Act (UMRA)
F. Executive Order 13132: Federalism
G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks
I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
J. National Technology Transfer and Advancement Act (NTTAA) and 1 CFR Part 51
K. Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations
L. Congressional Review Act (CRA)

I. General Information

A. Does this action apply to me?

Regulated entities. Categories and entities potentially regulated by this action are shown in Table 1 of this preamble.

TABLE 1—NESHAP AND INDUSTRIAL SOURCE CATEGORIES AFFECTED BY THIS FINAL ACTION

Source category	NESHAP	NAICS code [1]
Miscellaneous Viscose Processes	Cellulose Products Manufacturing	325211, 325220, 326121, 326199.
Cellulose Ethers Production	Cellulose Products Manufacturing	325199.

[1] North American Industry Classification System.

Table 1 of this preamble is not intended to be exhaustive, but rather to provide a guide for readers regarding entities likely to be affected by the final action for the source categories listed. To determine whether your facility is affected, you should examine the applicability criteria in the appropriate NESHAP. If you have any questions regarding the applicability of any aspect of this NESHAP, please contact the appropriate person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section of this preamble.

B. Where can I get a copy of this document and other related information?

In addition to being available in the docket, an electronic copy of this final action will also be available on the internet. Following signature by the EPA Administrator, the EPA will post a copy of this final action at: *https://www.epa.gov/stationary-sources-air-pollution/cellulose-products-manufacturing-national-emission-standards.* Following publication in the **Federal Register**, the EPA will post the **Federal Register** version at this same website.

Additional information is available on the RTR website at *https://www.epa.gov/stationary-sources-air-pollution/risk-and-technology-review-national-emissions-standards-hazardous.* This information includes an overview of the RTR program and links to project websites for the RTR source categories.

C. Judicial Review and Administrative Reconsideration

Under Clean Air Act (CAA) section 307(b)(1), judicial review of this final action is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit (the Court) by August 31, 2020. Under CAA section 307(b)(2), the requirements established by this final rule may not be challenged separately in any civil or criminal proceedings brought by the EPA to enforce the requirements. Section 307(d)(7)(B) of the CAA further provides that only an objection to a rule or procedure which was raised with reasonable specificity during the period for public comment (including any public hearing) may be raised during judicial review. This section also provides a mechanism for the EPA to reconsider the rule if the person raising an objection can demonstrate to the Administrator that it was impracticable to raise such objection within the period for public comment or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule. Any person seeking to make such a demonstration should submit a Petition for Reconsideration to the Office of the Administrator, U.S. EPA, Room 3000, WJC South Building, 1200 Pennsylvania Ave. NW, Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION**

CONTACT section, and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. EPA, 1200 Pennsylvania Ave. NW, Washington, DC 20460.

II. Background

A. What is the statutory authority for this action?

Section 112 of the CAA establishes a two-stage regulatory process to address emissions of HAP from stationary sources. In the first stage, the EPA must identify categories of sources emitting one or more of the HAP listed in CAA section 112(b) and then promulgate technology-based NESHAP for those sources. ''Major sources'' are those that emit, or have the potential to emit, any single HAP at a rate of 10 tons per year (tpy) or more, or 25 tpy or more of any combination of HAP. For major sources, these standards are commonly referred to as maximum achievable control technology (MACT) standards and must reflect the maximum degree of emission reductions of HAP achievable (after considering cost, energy requirements, and non-air quality health and environmental impacts). In developing MACT standards, CAA section 112(d)(2) directs the EPA to consider the application of measures, processes, methods, systems, or techniques, including, but not limited to, those that reduce the volume of or eliminate HAP emissions through process changes, substitution of materials, or other modifications; enclose systems or processes to eliminate emissions; collect, capture, or treat HAP when released from a process, stack, storage, or fugitive emissions point; are design, equipment, work practice, or operational standards; or any combination of the above.

For these MACT standards, the statute specifies certain minimum stringency requirements, which are referred to as MACT floor requirements, and which may not be based on cost considerations. See CAA section 112(d)(3). For new sources, the MACT floor cannot be less stringent than the emission control achieved in practice by the best-controlled similar source. The MACT standards for existing sources can be less stringent than floors for new sources, but they cannot be less stringent than the average emission limitation achieved by the best-performing 12 percent of existing sources in the category or subcategory (or the best-performing five sources for categories or subcategories with fewer than 30 sources). In developing MACT standards, the EPA must also consider control options that are more stringent than the floor under CAA section 112(d)(2). The Agency may establish standards more stringent than the floor based on the consideration of the cost of achieving the emissions reductions, any non-air quality health and environmental impacts, and energy requirements.

In the second stage of the regulatory process, the CAA requires the EPA to undertake two different analyses, which we refer to as the technology review and the residual risk review. Under the technology review, the EPA must review the technology-based standards and revise them ''as necessary (taking into account developments in practices, processes, and control technologies)'' no less frequently than every 8 years, pursuant to CAA section 112(d)(6). Under the residual risk review, the EPA must evaluate the risk to public health remaining after application of the technology-based standards and revise the standards, if necessary, to provide an ample margin of safety to protect public health or to prevent, taking into consideration costs, energy, safety, and other relevant factors, an adverse environmental effect. The residual risk review is required within 8 years after promulgation of the technology-based standards, pursuant to CAA section 112(f). In conducting the residual risk review, if the EPA determines that the current standards provide an ample margin of safety to protect public health, it is not necessary to revise the MACT standards pursuant to CAA section 112(f).[1] For more information on the statutory authority for this rule, see 84 FR 47348, September 9, 2019.

B. What is the source category and how does the NESHAP regulate HAP emissions from the source category?

The EPA promulgated the Cellulose Products Manufacturing NESHAP on June 11, 2002 (67 FR 40044). The standards are codified at 40 CFR part 63, subpart UUUU. The cellulose products manufacturing industry includes the Miscellaneous Viscose Processes (MVP) source category and the Cellulose Ethers Production (CEP) source category. The sections below provide details on each source category and how the NESHAP regulates the HAP emissions from each source category.

[1] The Court has affirmed this approach of implementing CAA section 112(f)(2)(A): *NRDC* v. *EPA,* 529 F.3d 1077, 1083 (D.C. Cir. 2008) (''If EPA determines that the existing technology-based standards provide an 'ample margin of safety,' then the Agency is free to readopt those standards during the residual risk rulemaking.'').

1. Miscellaneous Viscose Processes

The MVP source category includes any facility engaged in the production of cellulose food casings, rayon, cellophane, or cellulosic sponges, which includes the following process steps: Production of alkali cellulose from cellulose and sodium hydroxide (NaOH); production of sodium cellulose xanthate from alkali cellulose and carbon disulfide (CS_2) (xanthation); production of viscose from sodium cellulose xanthate and NaOH solution; regeneration of liquid viscose into solid cellulose;[2] and washing of the solid cellulose product (see 65 FR 52171–2, August 28, 2000).

There are currently five MVP facilities in operation in the United States. While the NESHAP includes standards for rayon manufacturing, all rayon plants in the U.S. have shut down since promulgation of the original rule.

The Cellulose Products Manufacturing NESHAP includes emission limits, operating limits, and work practice standards for MVP emission sources. MVP operations are required to reduce the total sulfide emissions from their process vents and control the CS_2 emissions from their CS_2 unloading and storage operations. Cellophane operations are required to reduce the toluene emissions from their solvent coating operations and toluene storage vessels. Additionally, MVP operations must comply with work practice standards for closed-vent systems and heat exchanger systems. The NESHAP also includes various operating limits, initial performance tests, ongoing monitoring using continuous parameter monitoring systems (CPMS) and continuous emissions monitoring systems (CEMS), recordkeeping, and reporting. The rule was amended in June 2005 (70 FR 36524) to correct the definition for ''viscose process change'' under 40 CFR 63.5610.

2. Cellulose Ethers Production

The CEP source category includes any facility engaged in the production of carboxymethyl cellulose (CMC), hydroxyethyl cellulose (HEC), hydroxypropyl cellulose (HPC), methyl cellulose (MC), or hydroxypropyl methyl cellulose (HPMC), which

[2] The MVP operations use different methods and equipment to complete the regeneration step. Cellulose food casing operations extrude viscose through a die, forming a tube, while rayon operations extrude viscose through spinnerets, forming thin strands. Cellophane operations extrude viscose through a long slit, forming a flat sheet, while cellulosic sponge operations feed a mixture of viscose and Glauber's salt into a sponge mold.

includes the following process steps: Production of alkali cellulose from cellulose and NaOH; reaction of the alkali cellulose with one or more organic chemicals to produce a cellulose ether product; [3] washing and purification of the cellulose ether product; and drying of the cellulose ether product (see 65 FR 52171; August 28, 2000).

There are currently three CEP facilities in operation in the United States. The Cellulose Products Manufacturing NESHAP includes emission limits, operating limits, and work practice standards for CEP emission sources. CEP operations are required to control the HAP emissions from their process vents, wastewater, equipment leaks, and liquid streams in open systems. Additionally, CEP operations must comply with work practice standards for closed-vent systems and heat exchanger systems. The NESHAP also includes various operating limits, initial performance tests, ongoing monitoring using CPMS and CEMS, recordkeeping, and reporting. The rule was amended in June 2005 (70 FR 36524) to correct the definition for ''cellulose ether process change'' under 40 CFR 63.5610.

C. What changes did we propose for the Cellulose Products Manufacturing NESHAP in our September 9, 2019, proposal?

On September 9, 2019, the EPA published a proposed rule in the **Federal Register** for the Cellulose Products Manufacturing NESHAP, 40 CFR part 63, subpart UUUU, that presented the results of the RTR analyses, proposed RTR determinations, and several proposed rule changes. Based on our RTR analyses, the EPA proposed to determine that the risks from the source categories covered by the Cellulose Products Manufacturing NESHAP are acceptable, that the current NESHAP provides an ample margin of safety to protect public health, and that no new cost-effective controls are available that would achieve further emissions reductions.

The proposed rule changes included the following:

- Amendments to the SSM provisions;
- new periodic air emissions performance testing for facilities that use non-recovery control devices;
- new reporting provisions requiring affected sources to electronically submit compliance notifications, semiannual reports and performance test reports using the EPA's Compliance and Emissions Data Reporting Interface (CEDRI);
- amendments to the operating limits and compliance requirements in 40 CFR 63.5535(i)(7) to allow facilities the flexibility to monitor conductivity as an alternative to pH monitoring for determining compliance of biofilter control devices;
- revision of the requirements in 40 CFR 63.5505 to clarify that CS_2 storage tanks that are part of a submerged unloading and storage operation subject to 40 CFR part 63, subpart UUUU, is not subject to 40 CFR part 60, subpart Kb;
- revision of the performance test requirements in 40 CFR 63.5535(b) and 40 CFR 63.5535(c) to specify the conditions for conducting performance tests;
- revisions to Table 4 to Subpart UUUU of Part 63 to correct an error in the reference to a test method appendix;
- revisions to the performance test requirements in Table 4 to Subpart UUUU of Part 63 to add IBR for ASTM D6420–99 (Reapproved 2010), ASTM D5790–95 (Reapproved 2012), and ASTM D6348–12e1;
- revision to the reporting requirements in 40 CFR 63.5580 and the reporting and recordkeeping requirements in Tables 8 and 9 to Subpart UUUU of Part 63 to include the requirements to record and report information on failures to meet the applicable standard and the corrective actions taken; and
- revisions to the General Provisions applicability table (Table 10 to Subpart UUUU of Part 63) to align with those sections of the General Provisions that have been amended or reserved over time.

III. What is included in this final rule?

This action finalizes the EPA's determinations pursuant to the RTR provisions of CAA section 112 for the MVP and the CEP source categories. This action also finalizes changes to the Cellulose Products Manufacturing NESHAP, including removal of the SSM exemption, addition of electronic reporting, addition of periodic emissions performance testing, amendments allowing more flexibility for monitoring of biofilter control devices, and other clarifications and corrections.

A. What are the final rule amendments based on the risk review for the source category?

1. Miscellaneous Viscose Processes

The EPA is finalizing its proposed finding that risk due to emissions of air toxics from this source category is acceptable, and is finalizing its proposed determination that the current NESHAP provides an ample margin of safety to protect public health and prevent an adverse environmental effect. Based on these determinations, we are not finalizing any revisions to the Cellulose Products Manufacturing NESHAP based on the analyses conducted under CAA section 112(f) for the MVP source category, and we are readopting the standards.

2. Cellulose Ethers Production

The EPA is finalizing its proposed finding that risk due to emissions of air toxics from this source category is acceptable, and is finalizing its proposed determination that the current NESHAP provides an ample margin of safety to protect public health and prevent an adverse environmental effect. Based on these determinations, we are not finalizing any revisions to the Cellulose Products Manufacturing NESHAP based on the analyses conducted under CAA section 112(f) for the CEP source category, and we are readopting the standards.

B. What are the final rule amendments based on the technology review for the source category?

1. Miscellaneous Viscose Processes

The EPA is finalizing its proposed determination that there are no developments in practices, processes, and control technologies that warrant revisions to the MACT standards for this source category. Therefore, we are not finalizing any revisions to the MACT standards under CAA section 112(d)(6).

2. Cellulose Ethers Production

The EPA is finalizing its proposed determination that there are no developments in practices, processes, and control technologies that warrant revisions to the MACT standards for this source category. Therefore, we are not finalizing any revisions to the MACT standards under CAA section 112(d)(6).

C. What are the final rule amendments addressing emissions during periods of SSM?

The EPA is finalizing the proposed amendments to the Cellulose Products Manufacturing NESHAP to remove and revise provisions related to SSM. In its 2008 decision in *Sierra Club* v. *EPA,* 551

[3] To produce CMC, HEC, HPC, MC, and HPMC, alkali cellulose is reacted with chloroacetic acid, ethylene oxide, propylene oxide, methyl chloride, and a combination of methyl chloride and propylene oxide, respectively.

F.3d 1019 (D.C. Cir. 2008), the Court vacated portions of two provisions in the EPA's CAA section 112 regulations governing the emissions of HAP during periods of SSM. Specifically, the Court vacated the SSM exemption contained in 40 CFR 63.6(f)(1) and 40 CFR 63.6(h)(1), holding that under section 302(k) of the CAA, emissions standards or limitations must be continuous in nature and that the SSM exemption violates the CAA's requirement that some CAA section 112 standards apply continuously. As detailed in section IV.D of the preamble to the proposed rule (84 FR 47366, September 9, 2019), the EPA proposed to eliminate the SSM exemption in 40 CFR 63.5515(a) so that the Cellulose Products Manufacturing NESHAP would apply at all times (see 40 CFR 63.5515(a)), including during SSM events, consistent with the Court decision in *Sierra Club* v. *EPA,* 551 F. 3d 1019 (D.C. Cir. 2008). In addition to proposing that the SSM exemption be eliminated, we proposed to remove the requirement for sources to develop and maintain an SSM plan, as well as certain recordkeeping and reporting provisions related to the SSM exemption.

The EPA is finalizing the proposed revision of 40 CFR 63.5515(a) to eliminate the SSM exemption. The EPA is also finalizing the removal of the SSM exemption in 40 CFR 63.5555(d) that states deviations that occur during SSM events are not violations if a facility meets the general duty requirements. In addition, we are updating the references in Table 10 to Subpart UUUU of Part 63—Applicability of General Provisions to Subpart UUUU, including the references to 40 CFR 63.6(f)(1) and (h)(1)—the provisions vacated by *Sierra Club* v. *EPA.* Consistent with that decision, the standards in this rule will now apply at all times. We are also revising Table 10 to Subpart UUUU of Part 63 to change several references related to requirements that apply during periods of SSM. For example, we are eliminating the incorporation of the General Provisions' requirement that sources develop an SSM plan. We also are eliminating and revising certain recordkeeping and reporting requirements related to the SSM exemption.

The EPA did not propose separate standards for malfunctions. As discussed in section IV.D.1 of the September 9, 2019 proposal preamble, the EPA interprets CAA section 112 as not requiring emissions that occur during periods of malfunction to be factored into development of CAA section 112 standards, although the EPA has the discretion to set standards for malfunctions where feasible. For the MVP source category and the CEP source category, it is unlikely that a malfunction would result in a violation of the standards. Facilities using thermal oxidizers as pollution control equipment indicated in the 2018 information collection survey that interlocks shut down processes when an oxidizer malfunction occurs, and facilities may also have back-up oxidizers that could be used to treat the emissions. Refer to section IV.D.1 of the preamble to the proposed rule for further discussion of the EPA's rationale for the decision not to set standards for malfunctions, as well as a discussion of the actions a source could take in the unlikely event that a source fails to comply with the applicable CAA section 112(d) standards as a result of a malfunction event, given administrative and judicial procedures for addressing exceedances of the standards fully recognize that violations may occur despite good faith efforts to comply and can accommodate those situations.

As is explained in more detail below, the EPA is finalizing revisions to the Table 10 to Subpart UUUU of Part 63—Applicability of General Provisions to Subpart UUUU, to eliminate requirements that include rule language providing an exemption for periods of SSM. Additionally, we are finalizing our proposal to eliminate language related to SSM that treats periods of startup and shutdown the same as periods of malfunction, as explained further below. Finally, we are finalizing our proposal to revise reporting and record keeping requirements as they relate to malfunctions, as further described below. As discussed in the proposal preamble, these revisions are consistent with the requirement in 40 CFR 63.5515(a) that the standards apply at all times. Refer to section IV.C of this preamble for a detailed discussion of these amendments.

D. What other changes have been made to the NESHAP?

The EPA is finalizing new requirements for periodic emissions testing, electronic reporting, and biofilter effluent conductivity monitoring. The periodic emissions testing is part of an ongoing effort to improve compliance with various federal air emission regulations. The new provisions require facilities that use non-recovery control devices to conduct periodic air emissions performance testing, with the first of the periodic performance tests to be conducted within *July 2, 2023,* and thereafter no longer than 5 years following the previous test. The periodic emissions tests will ensure control devices are properly maintained over time, thereby reducing the potential for acute emissions episodes.

The electronic reporting provisions require owners and operators to submit all initial notifications, compliance notifications, performance test reports, performance evaluation reports, and semiannual reports electronically through the EPA's Central Data Exchange (CDX) using CEDRI. A description of the electronic data submission process is provided in the memorandum, *Electronic Reporting Requirements for New Source Performance Standards (NSPS) and National Emission Standards for Hazardous Air Pollutants (NESHAP) Rules,* available at Docket ID Item No. EPA–HQ–OAR–2018–0415–0058.

The new biofilter effluent conductivity monitoring will allow owners and operators the flexibility to monitor either conductivity or pH to determine continuous compliance of biofilter control devices with the standards.

In addition to these new requirements, we are also finalizing several technical and editorial corrections and incorporating by reference three test method standards, in accordance with the provisions of 1 CFR 51.5. For more information on these changes, see 84 FR 47370–47371, September 9, 2019.

E. What are the effective and compliance dates of the standards?

The revisions to the NESHAP being promulgated in this action are effective on July 2, 2020. For sources that commenced construction or reconstruction before the notice of proposed rulemaking was published on September 9, 2019, the deadline to comply with the amendments in this rulemaking is no later than 180 days after the effective date of the final rule. Affected sources that commenced construction or reconstruction after September 9, 2019, must comply with all of the requirements of the subpart, including the amendments, immediately upon the effective date of the standard, July 2, 2020, or upon startup, whichever is later.

Through our work with other similar industries required to convert to electronic reporting, the EPA has found a period of 180 days is generally necessary to successfully install necessary hardware and software; become familiar with the process of submitting performance test results electronically through the EPA's CEDRI; test these new electronic submission capabilities; and reliably employ

electronic reporting. Our experience with similar industries has shown that facilities generally require a time period of 180 days to read and understand the amended rule requirements; evaluate their operations to ensure that they can meet the standards during SSM periods and make any necessary adjustments; adjust parameter monitoring and recording systems to accommodate revisions; and update their operations to reflect the revised requirements. Based on our assessment of the timeframe needed for facilities to comply with the amended rule, the EPA determined that a compliance date of within 180 days of the final rule's effective date was practicable. In the proposal, we solicited comment on whether the 180-day compliance period was reasonable and specifically requested sources provide information regarding the specific actions they would need to undertake to comply with the amended rule. We received no feedback on the proposed compliance deadlines. From our assessment of the timeframe needed for compliance with the entirety of the revised requirements, the EPA considers a period of 180 days to be the most expeditious compliance period practicable. Thus, all sources existing at the time the proposed rulemaking was published on September 9, 2019, must be in compliance with all of this regulation's revised requirements within 180 days of the regulation's effective date.

The final rule also requires sources that use a non-recovery control device to comply with the standards to conduct periodic performance tests every 5 years. Each source that commenced construction or reconstruction on or before September 9, 2019, and uses a non-recovery control device to comply with the standards must conduct the first periodic performance test on or before July 3, 2020, and conduct subsequent periodic performance tests no later than 5 years thereafter following the previous performance test. For each new and reconstructed affected source that commences construction or reconstruction after September 9, 2019, and uses a non-recovery control device to comply with the standards, the owners and operators must conduct the first periodic performance test no later than 5 years following the initial performance test required by 40 CFR 63.5535 and conduct subsequent periodic performance tests no later than 5 years thereafter following the previous performance test. We determined that a compliance date of 3 years for the first periodic performance test for sources constructed or reconstructed on or before September 9, 2019, was necessary to avoid scheduling issues that may arise as affected sources compete for a limited number of testing contractors.

IV. What is the rationale for our final decisions and amendments for the source category?

For each issue, this section provides a description of what we proposed and what we are finalizing for the issue, the EPA's rationale for the final decisions and amendments, and a summary of key comments and responses. For all comments not discussed in this preamble, comment summaries and the EPA's responses can be found in the comment summary and response document available in the docket, Docket ID No. EPA–HQ–OAR–2018–0415.

A. Residual Risk Review

1. Miscellaneous Viscose Processes

a. What did we propose pursuant to CAA section 112(f) for the source category?

The EPA estimated risks based on actual and allowable emissions from MVP sources subject to the Cellulose Products Manufacturing NESHAP. For the MVP source category, we estimated the chronic baseline inhalation cancer risk to be less than 1-in-1 million, with the risk driver being acetaldehyde emissions from viscose process equipment. The total estimated cancer incidence from MVP emission sources based on actual and allowable emission levels is 0.000006 excess cancer cases per year, or one case in every 167,000 years. Emissions of acetaldehyde contributed 100 percent to this cancer incidence. Based on actual and allowable emissions, no people are exposed to cancer risks greater than or equal to 1-in-1 million. The maximum chronic noncancer target organ-specific hazard index (TOSHI) values for the source category, based on actual and allowable emissions, are estimated to be less than 1. Based on actual and allowable emissions, CS_2 emissions from viscose process equipment are the risk driver for respiratory risks. For the acute risk assessment, the maximum refined offsite acute noncancer hazard quotient (HQ) value for the MVP source category is less than 1 from CS_2 emissions (based on the acute (1-hour) ERPG–1 for CS_2). We proposed that environmental and multipathway risks are not an issue for the MVP source category because there are no HAP known to be persistent and bio-accumulative in the environment (PB–HAP), lead compounds, or acid gases (hydrochloric acid (HCl) or hydrogen flouride) identified in the emissions inventory. The assessment of facility-wide emissions indicated that none of the five MVP facilities have a facility-wide maximum individual cancer risk (MIR) greater than 1-in-1 million and the maximum facility-wide cancer risk is 1-in-1 million, driven by formaldehyde, cadmium compounds, and nickel compounds from a non-category fugitive area source. The total estimated facility-wide cancer incidence is 0.00006 excess cancer cases per year, or one case in every 16,700 years, with zero people estimated to have cancer risks greater than 1-in-1 million. The maximum facility-wide chronic noncancer TOSHI is estimated to be less than 1, driven by source category emissions of CS_2 from viscose process equipment.

The risk assessment for this source category is contained in the report titled *Residual Risk Assessment for the Miscellaneous Viscose Processes Source Category in Support of the 2020 Risk* and *Technology Review Final Rule,* which can be found in the docket for this action (Docket ID No. EPA–HQ–OAR–2018–0415).

b. How did the risk review change for the source category?

The EPA has not made any changes to either the risk assessment or our determinations regarding risk acceptability, ample margin of safety, or adverse environmental effects for the MVP source category since the proposal was published on September 9, 2019. We are finalizing the risk review as proposed with no changes (84 FR 47346, September 9, 2019).

c. What key comments did we receive on the risk review, and what are our responses?

The EPA did not receive any comments specific to the MVP risk review and proposed results. We received comments from one commenter opposing our proposed risk assessment and determination that no revision to the standards is warranted under CAA section 112(f)(2). Generally, the commenter was not supportive of the acceptability and ample margin of safety determinations and suggested changes to the underlying risk assessment methodology. Examples of the commenter's suggested changes to the EPA's risk assessment methodology included lowering the presumptive limit of acceptability for cancer risks to below 100-in-1 million, including emissions outside of the source categories in question in the risk assessment, and assuming that pollutants with noncancer health risks

have no safe level of exposure. The comments and information provided by the commenter did not change our risk analyses or the proposed results that risks from the MVP source category are acceptable and provide an ample margin of safety.

For detailed summaries and responses to comments, see the memorandum in the docket, *National Emission Standards for Hazardous Air Pollutants: Cellulose Products Manufacturing (40 CFR part 63, subpart UUUU) Residual Risk and Technology Review, Final Amendments—Response to Public Comments on September 9, 2019 Proposal* (Docket ID No. EPA–HQ–OAR–2018–0415).

d. What is the rationale for our final approach and final decisions for the risk review?

As noted in the proposal, the EPA sets standards under CAA section 112(f)(2) using ''a two-step standard-setting approach, with an analytical first step to determine an 'acceptable risk' that considers all health information, including risk estimation uncertainty, and includes a presumptive limit on MIR of 'approximately 1-in-10 thousand' '' (see 54 FR 38045, September 14, 1989). We weigh all health risk factors in our risk acceptability determination, including the cancer MIR, cancer incidence, the maximum cancer TOSHI, the maximum acute noncancer HQ, the extent of noncancer risks, the distribution of cancer and noncancer risks in the exposed population, and the risk estimation uncertainties.

The EPA evaluated all of the comments on the risk review and determined that no changes to the review are needed. For the reasons explained in the proposal, we determined that the risks from the MVP source category are acceptable, and the current standards provide an ample margin of safety to protect public health and prevent an adverse environmental effect. Therefore, pursuant to CAA section 112(f)(2), we are finalizing our residual risk review as proposed.

2. Cellulose Ethers Production

a. What did we propose pursuant to CAA section 112(f) for the source category?

The EPA estimated risks based on actual and allowable emissions from CEP sources subject to the Cellulose Products Manufacturing NESHAP. For the source category, we estimated the chronic baseline inhalation cancer risk using current actual and allowable emissions to be 80-in-1 million with the risk driver being ethylene oxide emissions from cellulose ether process equipment used to produce HEC. The total estimated cancer incidence from CEP emission sources based on actual and allowable emission levels is 0.01 excess cancer cases per year, or one case in every 100 years. Emissions of ethylene oxide contributed 99 percent to this cancer incidence based on actual emissions. Based on actual or allowable emissions, 105,000 people are exposed to cancer risks greater than or equal to 1-in-1 million. The maximum chronic noncancer hazard index (TOSHI) values for the source category, based on actual and allowable emissions, are estimated to be less than 1. Based on actual and allowable emissions, respiratory risks are driven by chlorine emissions from cellulose ether process equipment. The maximum refined offsite acute noncancer HQ value for the source category is less than 1 from methanol emissions from cellulose ether process equipment (based on the acute (1-hour) reference exposure level for methanol). The highest HQ is based on an hourly emissions multiplier of 10 times the annual emissions rate. Acute HQs were not calculated for allowable or whole facility emissions. For the multipathway risk screening, one facility within the CEP source category reported emissions of multipathway pollutants of lead compounds, carcinogenic PB–HAP (arsenic), and noncarcinogenic PB–HAP (cadmium and mercury). Results of the worst-case Tier 1 screening analysis indicate that PB–HAP emissions (based on estimates of actual emissions) emitted from the facility exceeded the screening values for the carcinogenic PB–HAP (arsenic compounds) by a factor of 2, and for the noncarcinogenic PB–HAP (cadmium and mercury) is equal to the Tier 1 screening value of 1. Based on this Tier 1 screening assessment for carcinogens, the arsenic, cadmium, and mercury emission rates for the single facility are below our level of concern. The highest annual average lead concentration of 0.00001 milligrams per cubic meter is well below the National Ambient Air Quality Standard (NAAQS) for lead, indicating a low potential for multipathway impacts of concern due to lead. For the environmental risk screening, the three CEP facilities reported emissions of lead compounds, an acid gas (HCl), arsenic, cadmium, and mercury. In the Tier 1 screening analysis for PB–HAP, no exceedances of the ecological benchmarks evaluated were found. For lead, we did not estimate any exceedances of the secondary lead NAAQS. For HCl, the average modeled concentration around each facility (*i.e.,* the average concentration of all off-site data points in the modeling domain) did not exceed any ecological benchmark. In addition, each individual modeled concentration of HCl (*i.e.,* each off-site data point in the modeling domain) was below the ecological benchmarks for all facilities. Based on the results of the environmental risk screening analysis, we do not expect an adverse environmental effect as a result of HAP emissions from this source category. Results of the assessment of facility-wide emissions indicate that all three facilities modeled have a facility-wide MIR cancer risk greater than 1-in-1 million. The maximum facility-wide cancer risk is 500-in-1 million, mainly driven by ethylene oxide from sources outside the source category, including holding ponds, storage tanks, tank truck unloading, and equipment/vent releases. The next highest cancer risk was 80-in-1 million, based on whole facility emissions of ethylene oxide. The total estimated cancer incidence from the whole facility is 0.04 excess cancer cases per year, or one case in every 25 years, with 570,000 people estimated to have cancer risks greater than 1-in-1 million and 2,000 people with risks greater than 100-in-1 million. The maximum facility-wide chronic noncancer TOSHI is estimated to be equal to 4, driven by emissions of chlorine from non-category sources.

The risk assessment for this source category are contained in the report titled *Residual Risk Assessment for the Cellulose Ethers Production Source Category in Support of the 2020 Risk and Technology Review Final Rule,* which can be found in the docket for this action.

b. How did the risk review change for the source category?

The EPA did not make any changes to either the risk assessments or our determinations regarding risk acceptability, ample margin of safety, or adverse environmental effects for the CEP source category since the proposal was published on September 9, 2019. We are finalizing the residual risk review as proposed with no changes (84 FR 47346, September 9, 2019).

c. What key comments did we receive on the risk review, and what are our responses?

The EPA received one comment opposing our proposed risk assessment and determination that no revision to the standards for the CEP source category are warranted under CAA section 112(f)(2). Generally, the commenter was not supportive of the

acceptability and ample margin of safety determinations and suggested changes to the underlying risk assessment methodology. The commenter asserted that changes to the EPA's risk assessment methodology were needed, including that the EPA should lower its presumptive limit of acceptability for cancer risks to below 100-in-1 million, include emissions outside of the source categories in question in the risk assessment, and assume that pollutants with noncancer health risks have no safe level of exposure. The commenter supported the proposal's use of the 2016 Integrated Risk Information System (IRIS) value for ethylene oxide. The comments and information provided by the commenter did not change our risk analyses or the proposed results that risks from the CEP source category are acceptable and provide an ample margin of safety.

For a detailed summary of the comments and our responses, see the memorandum in the docket, *National Emission Standards for Hazardous Air Pollutants: Cellulose Products Manufacturing (40 CFR part 63, subpart UUUU) Residual Risk and Technology Review, Final Amendments—Response to Public Comments on September 9, 2019 Proposal.*

d. What is the rationale for our final approach and final decisions for the risk review?

As noted in our proposal, the EPA sets standards under CAA section 112(f)(2) using ''a two-step standard-setting approach, with an analytical first step to determine an 'acceptable risk' that considers all health information, including risk estimation uncertainty, and includes a presumptive limit on MIR of 'approximately 1-in-10 thousand' '' (see 54 FR 38045, September 14, 1989). We weigh all health risk factors in our risk acceptability determination, including the cancer MIR, cancer incidence, the maximum cancer TOSHI, the maximum acute noncancer HQ, the extent of noncancer risks, the distribution of cancer and noncancer risks in the exposed population, and the risk estimation uncertainties.

The EPA evaluated all of the comments on the risk review and determined that no changes to the review are needed. For the reasons explained in the proposal, we determined that the risk from the CEP source category is acceptable, and the current standards provide an ample margin of safety to protect public health and prevent an adverse environmental effect. Therefore, pursuant to CAA section 112(f)(2), we are finalizing our residual risk review as proposed.

B. Technology Review

1. Miscellaneous Viscose Processes

a. What did we propose pursuant to CAA section 112(d)(6) for the source category?

Pursuant to CAA section 112(d)(6), the EPA proposed to conclude that no revisions to the current MACT standards for the MVP source category are necessary (section IV.C of proposal preamble, 84 FR 47365, September 9, 2019). Based on the review, we did not identify any developments in practices, processes, or control technologies for the MVP source category, and, therefore, we did not propose any changes to the standards under CAA section 112(d)(6). Additional details of our technology review can be found in the memorandum, *Technology Review for the Cellulose Products Manufacturing Industry—Proposed Rule* (Docket ID Item No. EPA–HQ–OAR–2018–0415–0119).

b. How did the technology review change for the source category?

The EPA has not made any changes to the technology review for the MVP source category since the proposal was published on September 9, 2019. We are finalizing the technology review as proposed with no changes (84 FR 47346, September 9, 2019).

c. What key comments did we receive on the technology review, and what are our responses?

We received comments from one commenter that did not support the proposed determination from the technology review that no revisions were warranted under CAA section 112(d)(6). In general, the commenter claimed that the EPA failed to consider all HAP emitted by the source category and that the EPA should set new standards for previously unregulated emission points/pollutants as part of the technology review.

The EPA disagrees with the commenter's assertion that the EPA failed to consider all HAP emitted and that we should set new standards for previously unregulated emission points/pollutants as part of the technology review. CAA section 112(d)(6) requires the EPA to review and revise, as necessary (taking into account developments in practices, processes, and control technologies), emission standards promulgated under this section. The EPA reads CAA section 112(d)(6) as a limited provision requiring the Agency to, at least every 8 years, review the emission standards already promulgated in the NESHAP and to revise those standards as necessary, taking into account developments in practices, processes, and control technologies. Nothing in CAA section 112(d)(6) directs the Agency, as part of or in conjunction with the mandatory 8-year technology review, to develop new emission standards to address HAP or emission points for which standards were not previously promulgated. As shown by the statutory text and the structure of CAA section 112, CAA section 112(d)(6) does not impose upon the Agency any obligation to promulgate emission standards for previously unregulated emissions as part of the technology review.

When the EPA establishes standards for previously unregulated emissions, we do so pursuant to the provisions that govern initial standard setting—CAA sections 112(d)(2) and (3) or, if the prerequisites are met, CAA section 112(d)(4) or CAA section 112(h). Establishing emissions standards under these provisions of the CAA involves a different analytical approach from reviewing emissions standards under CAA section 112(d)(6).

Though the EPA has discretion to develop standards under CAA section 112(d)(2) through (4) and CAA section 112(h) for previously unregulated pollutants at the same time as the Agency completes the CAA section 112(d)(6) review, any such action would not be part of the CAA section 112(d)(6) review, and there is no obligation to undertake such actions at the same time as the CAA section 112(d)(6) review. Additionally, given the court-ordered deadline of March 13, 2020, we did not have sufficient time to analyze existing data, determine if additional data were needed, collect additional data, and develop new emission standards. Therefore, we are not establishing new standards for previously unregulated emissions as part of this rulemaking.

For detailed summaries and responses regarding the technology review, see the memorandum in the docket, *National Emission Standards for Hazardous Air Pollutants: Cellulose Products Manufacturing (40 CFR part 63, subpart UUUU) Residual Risk and Technology Review, Final Amendments—Response to Public Comments on September 9, 2019 Proposal* (Docket ID No. EPA–HQ–OAR–2018–0415).

d. What is the rationale for our final approach for the technology review?

The EPA evaluated all of the comments on the technology review and determined that no changes to the

review are needed. Therefore, pursuant to CAA section 112(d)(6), we are finalizing our technology review as proposed. Additional details of our technology review can be found in the memorandum titled *Technology Review for the Cellulose Products Manufacturing Industry,* which is available in the docket for this action (Docket ID Item No. EPA–HQ–OAR–2018–0415–0119).

2. Cellulose Ethers Production

a. What did we propose pursuant to CAA section 112(d)(6) for the source category?

Pursuant to CAA section 112(d)(6), the EPA proposed to conclude that no revisions to the current MACT standards for the CEP source category are necessary (section IV.C of proposal preamble, 84 FR 47365, September 9, 2019). Our review of the developments in technology for the source category did not reveal any changes in practices, processes, and controls that warrant revisions to the emission standards. Based on our review, we did not identify any developments in practices, processes, or control technologies for the CEP source category, and, therefore, we did not propose any changes to the standards under CAA section 112(d)(6). Additional details of our technology review can be found in the memorandum, *Technology Review for the Cellulose Products Manufacturing Industry—Proposed Rule* (Docket ID Item No. EPA–HQ–OAR–2018–0415–0119).

b. How did the technology review change for the source category?

The EPA has not made any changes to the technology review for the CEP source category since the proposal was published on September 9, 2019. We are finalizing the technology review as proposed with no changes (84 FR 47346, September 9, 2019).

c. What key comments did we receive on the technology review, and what are our responses?

The EPA received comments from one commenter that did not support the proposed determination from the technology review that no revisions were warranted under CAA section 112(d)(6). In general, the commenter claimed that the EPA failed to consider all HAP emitted and that the EPA should set new standards for previously unregulated emission points/pollutants as part of the technology review. The commenter also claimed that the EPA did not consider leak detection and repair, fenceline monitoring, process changes, dry sorbent injection, or spray dryer absorbers as part of the technology review.

The EPA disagrees with the commenter's assertion that the EPA failed to consider all HAP emitted and that we should set new standards for previously unregulated emission points/pollutants as part of the technology review. See the discussion of this topic in section IV.B.1.c of this preamble.

The EPA also disagrees with the commenter's assertion that the EPA failed to consider leak detection and repair, fenceline monitoring, process changes, dry sorbent injection, or spray dryer absorbers as part of the technology review. The Agency did consider these options but found that they were not appropriate for the CEP emission sources. See the comment response document, *National Emission Standards for Hazardous Air Pollutants: Cellulose Products Manufacturing (40 CFR part 63, subpart UUUU) Residual Risk and Technology Review, Final Amendments—Response to Public Comments on September 9, 2019 Proposal,* for more details.

d. What is the rationale for our final approach for the technology review?

We evaluated all of the comments on the technology review and determined that no changes to the review are needed. Therefore, pursuant to CAA section 112(d)(6), we are finalizing our technology review as proposed. Additional details of our technology review can be found in the memorandum titled *Technology Review for the Cellulose Products Manufacturing Industry,* which is available in the docket for this action (Docket ID Item No. EPA–HQ–OAR–2018–0415–0119).

C. Removal of the SSM Exemption

1. What did we propose?

The EPA proposed amendments to the Cellulose Product Manufacturing NESHAP to remove the provisions related to SSM that are not consistent with the requirement that the standards apply at all times. The proposed amendments included:

- Revising Table 10 (General Provisions) entry for 40 CFR 63.6(e)(1) and (2) by redesignating it as 40 CFR 63.6(e)(1)(i) and changing the ''yes'' in column 4 to a ''no'' and adding general duty regulatory text to 40 CFR 63.5515 that reflect the general duty to minimize emissions included in 40 CFR 63.6(e)(1) without the references to SSM;
- revising Table 10 by adding an entry for 40 CFR 63.6(e)(1)(ii) and including a ''no'' in column 4 because 40 CFR 63.6(e)(1)(ii) imposes requirements that are not necessary with the elimination of the SSM exemption or are redundant with the general duty requirement being added at 40 CFR 63.5515;
- removing the SSM plan requirements by changing the Table 10 entry for 40 CFR 63.6(e)(3) from ''yes'' in column 4 to ''no'';
- revising the compliance standards in Table 10 by changing the entry for 40 CFR 63.6(f)(1) from ''yes'' to ''no,'' redesignating 40 CFR63.6(h) as 40 CFR 63.6(h)(1), and changing the ''yes'' to ''no'' in column 4;
- revising the performance testing requirements in Table 10 by changing the entry for 40 CFR 63.7(e)(1) from ''yes'' in column 4 to a ''no'' and revising 40 CFR 63.5535(b) and 40 CFR 63.5535(c) to specify the conditions under which performance tests should be completed;
- revising the monitoring requirements entries in Table 10 for 40 CFR 63.8(c)(1)(i) and (iii) by changing the ''yes'' in column 4 to ''no'' and revising 40 CFR 63.5545(b)(1) to specify the ongoing operation and maintenance procedures;
- adding a new entry to Table 10 for 40 CFR 63.8(d)(3) with a ''no'' entered in column 4 and adding the language in 40 CFR 63.8(d)(3) to Table 9 except that the final sentence is replaced with the following: ''The program of corrective action should be included in the plan required under 40 CFR 63.8(d)(2).'';
- revising the recordkeeping requirements in Table 10 by redesignating the entries for 40 CFR 63.10(b)(2)(i) through (iv) as 40 CFR 63.10(b)(2)(i) and changing the ''yes'' in column 4 to a ''no'' and revising the recordkeeping requirements to Table 9 to clarify what records are required for SSM events;
- adding an entry for 40 CFR 63.10(b)(2)(ii) to Table 10 and including a ''no'' in column 4 and adding text to Table 9 that is similar to 40 CFR 63.10(b)(2)(ii) that describes the recordkeeping requirements during a malfunction;
- revising the recordkeeping provisions by adding entries for 40 CFR 63.10(b)(2)(iv), 40 CFR 63.10(b)(2)(v), and 40 CFR 63.10(c)(15) to Table 10 and adding ''no'' in column 4 for each new entry;
- revising the entry for 40 CFR 63.10(d)(5) in Table 10 by redesignating it as 40 CFR 63.10(d)(5)(i) and changing the ''yes'' in column 4 to a ''no'';
- adding reporting requirements to 40 CFR 63.5580 and Table 8 to eliminate periodic SSM reports as a stand-alone report and require sources that fail to meet an applicable standard at any time

to report the number, date, time, duration, list of affected source or equipment, estimate of the quantity of each regulated pollutant emitted, a description of the method used to estimate the emissions, and the cause of such events in the semiannual compliance report already required under this rule; and

• revising the reporting requirements in Table 10 by adding an entry for 40 CFR 63.10(d)(5)(ii) and including a ''no'' in column 4.

More information concerning the elimination of SSM provisions is in the preamble to the proposed rule (84 FR 47366–47370, September 9, 2019).

2. What changed since proposal?

We are finalizing the removal of the SSM exemption as proposed with no changes (84 FR 47346, September 9, 2019).

3. What are the key comments and what are our responses?

Only one commenter submitted comments related to our proposed removal of the SSM exemption, and their comments generally supported the proposed removal of the SSM provisions but stated that the EPA cannot finalize a malfunction exemption, as proposed. The Agency did not propose a malfunction exemption in this rulemaking, therefore, this portion of the comment was not relevant. We evaluated the comments and determined that no changes to the proposed SSM provisions are warranted. A summary of these comments and our responses are located in the memorandum titled *National Emission Standards for Hazardous Air Pollutants: Cellulose Products Manufacturing (40 CFR part 63, subpart UUUU) Residual Risk and Technology Review, Final Amendments—Response to Public Comments on September 9, 2019 Proposal,* in the docket for this rulemaking.

4. What is the rationale for our final approach for the SSM provisions?

The EPA evaluated all comments on the EPA's proposed amendments to remove the SSM exemption. For the reasons explained in the proposed rule, we determined that the proposed amendments remove and revise provisions related to SSM that are not consistent with the requirement that the standards apply at all times. More information concerning the amendments we are finalizing for SSM is in the preamble to the proposed rule (84 FR 47366–47370, September 9, 2019). We are finalizing our approach for removing the SSM exemption as proposed.

D. Five-Year Periodic Emissions Testing

1. What did we propose?

The EPA proposed to add new requirements for periodic performance testing at 40 CFR 63.5535(g)(1), 40 CFR 63.5535(h)(1), and 40 CFR 63.5541 for facilities that use non-recovery control devices. We proposed that facilities constructed or reconstructed on or before September 9, 2019, conduct periodic air emissions performance testing every 5 years, with the first periodic performance test to be conducted within 3 years of the effective date of the revised standards and thereafter every 5 years following the previous test. For facilities that commence construction after September 9, 2019, we proposed a periodic performance test be completed within 5 years of the initial performance required by 40 CFR 63.5535 and that subsequent tests be conducted every 5 years thereafter.

2. What changed since proposal?

We are finalizing the 5-year periodic emission testing requirements for facilities that use non-recovery control devices as proposed with no changes (84 FR 47346, September 9, 2019).

3. What are the key comments and what are our responses?

We did not receive any comments on the proposed 5-year periodic emission testing requirements for facilities that use non-recovery control devices.

4. What is the rationale for our final approach for the 5-year periodic emission testing?

For the reasons explained in the preamble to the proposed rule and taking into account the fact that the EPA received no comments relating to the proposed provisions, we are finalizing the requirement for facilities that use non-recovery control devices to conduct periodic emissions tests once every 5 years. The new performance tests will serve as a check on the accuracy of facilities' mass balance calculations and on the efficiency of the control devices used to achieve compliance with the standards. The new performance testing will ensure that control devices are properly maintained over time, thereby reducing the potential for acute emissions episodes.

E. Electronic Reporting

1. What did we propose?

The EPA proposed amendments to the Cellulose Products Manufacturing NESHAP to require owners and operators of MVP and CEP facilities to submit electronic copies of initial notifications, notifications of compliance status, performance test reports, performance evaluation reports, and semiannual reports through the EPA's CDX using CEDRI. Additionally, we proposed two broad circumstances in which electronic reporting extensions may be provided at the discretion of the Administrator. The EPA proposed these extensions to protect owners and operators from noncompliance in cases where they are unable to successfully submit a report by the reporting deadline for reasons outside of their control, including CDX and CEDRI outages and *force majeure* events, such as acts of nature, war, or terrorism.

2. What changed since proposal?

No changes have been made to the proposed requirement for owners and operators of MVP and CEP facilities to submit initial notifications, notifications of compliance status, performance test reports, performance evaluation reports, and semiannual reports electronically using CEDRI. Therefore, we are finalizing the electronic reporting provisions as proposed with no changes (84 FR 47346, September 9, 2019).

3. What are the key comments and what are our responses?

The EPA received one comment supporting the proposed amendment to require electronic reporting. The commenter, however, asserted that the *force majeure* language should be removed. The commenter expressed concern that proposed 40 CFR 63.5420(c)(5) provides an exemption from reporting due to *force majeure* events. The commenter noted that the Court rejected similar ''affirmative defense'' to civil penalties for malfunctions (*NRDC* v. *EPA,* 749 F.3d 1055 (D.C. Cir. 2014)). The commenter also argued that adding such an exemption would be arbitrary and unlawful because it would undermine the reporting requirements by providing a justification to delay reporting, and, thus, undermine compliance, enforcement, and fulfillment of the emissions standards designed to protect public health and the environment at the core of the CAA's and section 7412's purpose (42 U.S.C. 740).

The commenter is incorrect in referring to 40 CFR 63.5420(c)(5) as an ''exemption.'' This provision provides instructions for actions an affected source should take if it is unable to submit an electronic report (required under 40 CFR 63.5420(c)) ''due to a *force majeure* event that is about to

occur, occurs, or has occurred, or if there are lingering effects from such an event within the period of time beginning 5 business days prior to the date the submission is due'' under 40 CFR 63.5420(c). We note that there is no exception or exemption to reporting, only a method for requesting an extension of the reporting deadline. As specified in 40 CFR 63.5420(c)(5), ''[t]he decision to accept the claim of *force majeure* and allow an extension to the reporting deadline is solely within the discretion of the Administrator.'' There is no predetermined timeframe for the length of extension that can be granted, as this is something best determined by the Administrator when reviewing the circumstances surrounding the request. Different circumstances may require a different length of extension for electronic reporting. For example, a tropical storm may delay electronic reporting for a day, but a category 5 hurricane event may delay electronic reporting much longer, especially if the facility has no power, and, as such, the owner or operator has no ability to access electronically stored data or to submit reports electronically. The Administrator will be the most knowledgeable on the events leading to the request for extension and will assess whether an extension is appropriate and, if so, determine a reasonable length. The Administrator may even request that the report be sent in hardcopy until electronic reporting can be resumed. While no new fixed duration deadline is set, the regulation does require that the report be submitted electronically as soon as possible after the CEDRI outage is resolved or after the *force majeure* event occurs.

We also note that the *force majeure* mimics long-standing language in 40 CFR 63.7(a)(4) and 60.8(a)(1) regarding the time granted for conducting a performance test and such language has not undermined compliance or enforcement.

Moreover, we disagree that the reporting extension will undermine enforcement because the Administrator has full discretion to accept or reject the claim of a CEDRI system outage or *force majeure.* As such, an extension is not automatic and is agreed to on an individual basis by the Administrator. If the Administrator determines that a facility has not acted in good faith to reasonably report in a timely manner, the Administrator can reject the claim and find that the failure to report timely is a deviation from the regulation. CEDRI system outages are infrequent, but the EPA knows when they occur and whether a facility's claim is legitimate. *Force majeure* events (*e.g.,* natural disasters impacting a facility) are also usually well-known events.

We also disagree that the ability to request a reporting extension would undermine compliance and fulfillment of the emissions standards. While reporting is an important mechanism for the EPA and air agencies to assess whether owners or operators are in compliance with emissions standards, reporting obligations have nothing to do with whether an owner or operator is required to be in compliance with an emissions standard, especially where the deadline for meeting the standard has already passed and the owner or operator has certified that they are in compliance with the standard.

Additionally, the ability to request a reporting extension does not apply to a broad category of circumstances; on the contrary, the scope for submitting a reporting extension request is very limited in that claims can only be made for events outside of the owner's or operator's control that occur in the 5 business days prior to the reporting deadline. The claim must then be approved by the Administrator, and, in approving such a claim, the Administrator agrees that something outside the control of the owner or operator prevented the owner or operator from meeting its reporting obligation. In no circumstance does this reporting extension allow for the owner or operator to be out of compliance with the emissions standards.

The reporting deadline extension differs from the affirmative defense to civil penalties for malfunctions the Court vacated as beyond the EPA's authority under the CAA in *NRDC* v. *EPA,* 749 F.3d 1055 (D.C. Cir. 2014). Unlike the affirmative defense addressed in *NRDC,* the reporting provision does not address penalty liability for noncompliance with emission standards, but merely addresses, under a narrow set of circumstances outside the control of the facilities, the deadline for reporting.

A detailed summary of these comments and our responses are located in the memorandum titled *National Emission Standards for Hazardous Air Pollutants: Cellulose Products Manufacturing (40 CFR part 63, subpart UUUU) Residual Risk and Technology Review, Final Amendments—Response to Public Comments on September 9, 2019 Proposal,* in the docket for this rulemaking (Docket ID No. EPA–HQ–OAR–2018–0415).

4. What is the rationale for our final approach to electronic reporting?

The EPA is finalizing, as proposed, a requirement that owners or operators of MVP and CEP facilities submit electronic copies of notifications, performance evaluation reports, and semiannual compliance reports using CEDRI. We also are finalizing, as proposed, provisions that allow facility owners or operators a process to request extensions for submitting electronic reports for circumstances beyond the control of the facility (*i.e.,* for a possible outage in the CDX or CEDRI or for a *force majeure* event). The amendments will increase the ease and efficiency of data submittal for owners and operators of MVP and CEP facilities and will make the data more accessible to regulators and the public.

F. Changes to the Monitoring Requirements for Biofilter Control Devices

1. What did we propose?

The EPA proposed revisions to the operating limits in Table 2 to Subpart UUUU of Part 63 to add biofilter effluent conductivity to the list of biofilter operating limits, revisions to the performance testing requirements in 40 CFR 63.5535(i)(7) to add biofilter effluent conductivity to the list of parameters for which operating limits must be established during the compliance demonstration, and revisions to the continuous compliance with operating limits in Table 6 to Subpart UUUU of Part 63 to add biofilter effluent conductivity to the list of parameters to monitor to demonstrate continuous compliance.

2. What changed since proposal?

The EPA has not made any changes to the proposed amendments to include biofilter effluent conductivity monitoring provisions since publication of the proposal on September 9, 2019. We are finalizing the alternative monitoring provisions as proposed with no changes (84 FR 47346, September 9, 2019).

3. What are the key comments and what are our responses?

No comments were received on the proposed addition of biofilter effluent conductivity monitoring provisions.

4. What is the rationale for our final approach to monitoring of biofilter control devices?

The EPA is finalizing the proposed revisions to allow monitoring of biofilter effluent conductivity as an alternative to effluent pH for biofilter control devices.

As we explained in the proposal, the EPA has conditionally approved an alternative monitoring request from one company to use conductivity in lieu of pH monitoring pursuant to 40 CFR 63.8(f). The company's request stated that conductivity would provide a more accurate operating limit than pH for strong acids and bases. To allow other sources the flexibility to use conductivity for monitoring of biofilter control devices without the need to request approval for each source, we have finalized the changes as described in the proposal.

G. IBR Under 1 CFR Part 51 for the Cellulose Products Manufacturing NESHAP

1. What did we propose?

In accordance with requirements of 1 CFR 51.5, the EPA proposed to IBR the following documents into 40 CFR 63.14:

- ASTM D6420–99 (Reapproved 2010), Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry, IBR approved for Table 4 to Subpart UUUU of Part 63;
- ASTM D5790–95 (Reapproved 2012), Standard Test Method for Measurement of Purgeable Organic Compounds in Water by Capillary Column Gas Chromatography/Mass Spectrometry, IBR approved for Table 4 to Subpart UUUU of Part 63; and
- ASTM D6348–12e1, Standard Test Method for Determination of Gaseous Compounds by Extractive Direct Interface Fourier Transform Infrared (FTIR) Spectroscopy, IBR approved for Table 4 to Subpart UUUU of Part 63.

2. What changed since proposal?

The EPA has not made any changes to its proposal to IBR the documents listed above. We are incorporating these documents by reference into 40 CFR 63.14 as proposed (84 FR 47346, September 9, 2019). We have also included an IBR for ASTM D6348–03, Standard Test Method for Determination of Gaseous Compounds by Extractive Direct Interface Fourier Transform Infrared (FTIR) Spectroscopy, in this rulemaking. It was determined that the appendices in this method were needed for use with the ASTM D6348–12e1 method.

3. What are the key comments and what are our responses?

No comments were received on the proposed IBR of the standards into 40 CFR 63.14.

4. What is the rationale for our amendments?

In the proposal, we proposed regulatory text that included IBR. In accordance with requirements of 1 CFR 51.5, we have finalized as proposed the IBR of the four documents listed in sections IV.E.1 and IV.E.2 of this preamble.

H. Technical and Editorial Changes for the Cellulose Products Manufacturing NESHAP

1. What did we propose?

The EPA proposed the following technical and editorial changes:

- Add a new paragraph at 40 CFR 63.5505(f) to clarify that CS_2 storage tanks that are part of a submerged unloading and storage operation subject to 40 CFR part 63, subpart UUUU, are not subject to 40 CFR part 60, subpart Kb;
- revise the performance test requirements in 40 CFR 63.5535 to specify the conditions for conducting performance tests;
- revise the performance evaluation requirements in 40 CFR 63.5545(e)(2) to specify the use of Procedure 1 of 40 CFR part 60, appendix F for quality assurance procedures;
- revise the performance test requirements table (Table 4 to Subpart UUUU of Part 63) to correct an error in the reference to a test method appendix;
- revise the performance test requirements table (Table 4 to Subpart UUUU of Part 63) to add IBR for ASTM D6420–99 (Reapproved 2010), ASTM D5790–95 (Reapproved 2012), and ASTM D6348–12e1;
- revise the reporting requirements in 40 CFR 63.5580 and the reporting and recordkeeping requirements tables (Tables 8 and 9 to Subpart UUUU of Part 63) to include the requirements to record and report information on failures to meet the applicable standard and the corrective actions taken; and
- revise the General Provisions applicability table (Table 10 to Subpart UUUU of Part 63) to align with those sections of the General Provisions that have been amended or reserved over time.

2. What changed since proposal?

We are finalizing the technical and editorial changes as proposed with no changes (84 FR 47346, September 9, 2019).

3. What are the key comments and what are our responses?

No comments were received on the proposed technical and editorial corrections.

4. What is the rationale for our final approach?

We are finalizing the technical and editorial changes as proposed for the reasons stated in section IV.E.6 of the proposal preamble.

V. Summary of Cost, Environmental, and Economic Impacts and Additional Analyses Conducted

A. What are the affected facilities?

There are currently eight facilities operating in the United States that conduct MVP and CEP operations that are subject to the Cellulose Products Manufacturing NESHAP. The 40 CFR part 63, subpart UUUU affected source for the MVP source category is each cellulose food casing, rayon, cellulosic sponge, or cellophane operation, as defined in 40 CFR 63.5610. The affected source for the CEP source category is each cellulose ether operation, as defined in 40 CFR 63.5610.

B. What are the air quality impacts?

The EPA estimates that annual HAP emissions from the MVP and CEP facilities that are subject to the NESHAP are approximately 4,300 tpy. We are not establishing new emission limits and are not requiring additional controls; therefore, no quantifiable air quality impacts are expected as a result of the final amendments to the rule. However, the final amendments, including the removal of the SSM exemption and addition of periodic emissions testing, have the potential to reduce excess emissions from sources by ensuring proper operation of control devices.

The final amendments will have no effect on the energy needs of the affected facilities and, therefore, have no indirect or secondary air emissions impacts.

C. What are the cost impacts?

The eight facilities subject to the final amendments will incur minimal net costs to meet the revised recordkeeping and reporting requirements and will incur periodic emissions testing costs for add-on control devices. The nationwide costs associated with the new periodic testing requirements are estimated to be $490,000 (2018$) over the 5 years following promulgation of the amendments. For further information on the costs, see the memorandum titled *Costs and Environmental Impacts of Regulatory Options for the Cellulose Products Manufacturing Industry,* and the document titled *Supporting Statement for the NESHAP for Cellulose Products Manufacturing (40 CFR part 63, subpart UUUU),* which are both available in the

docket for this final rule (Docket ID No. EPA–HQ–OAR–2018–0415).

D. What are the economic impacts?

The final revisions to the Cellulose Products Manufacturing NESHAP have some costs associated with the periodic testing requirements and these costs are not expected to have significant economic impacts.

E. What are the benefits?

The final amendments will result in improved monitoring, compliance, and implementation of the rule by adding provisions for periodic emissions testing, requiring MVP and CEP facilities to meet the same emission standards during SSM events as during normal operations, and requiring electronic submittal of initial notifications, performance test results, and semiannual reports. These improvements will further assist in the protection of public health and the environment. The electronic reporting requirements will improve data availability and ultimately result in less burden on the regulated community.

F. What analysis of environmental justice did we conduct?

Executive Order 12898 (59 FR 7629, February 16, 1994) establishes federal executive policy on environmental justice. Its main provision directs federal agencies, to the greatest extent practicable and permitted by law, to make environmental justice part of their mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority populations and low-income populations in the United States.

To examine the potential for any environmental justice issues that might be associated with the Cellulose Products Manufacturing NESHAP, we performed a demographic analysis for the MVP and CEP source categories, which is an assessment of risks to individual demographic groups of the populations living within 5 kilometers (km) and within 50 km of the facilities. In each analysis, we evaluated the distribution of HAP-related cancer and noncancer risks from the MVP and CEP source categories across different demographic groups within the populations living near facilities.[4]

For the MVP source category, we determined that no one is exposed to a cancer risk at or above 1-in-1 million or to a chronic noncancer TOSHI greater than 1. The methodology and the results of the MVP demographic analysis are presented in a technical report, *Risk and Technology Review—Analysis of Demographic Factors for Populations Living Near Miscellaneous Viscose Processes Facilities,* available in the docket for this action.

For the CEP source category, the results of the demographic analysis indicate that emissions from the source category expose approximately 104,572 people to a cancer risk at or above 1-in-1 million and approximately zero people to a chronic noncancer TOSHI greater than 1. The percentages of the at-risk population in three demographic groups (African American, above poverty level, and over 25 without high school diploma) are greater than their respective nationwide percentages. The methodology and the results of the CEP demographic analysis are presented in the technical report, *Risk and Technology Review—Analysis of Demographic Factors for Populations Living Near Cellulose Ethers Production Facilities,* available in the docket for this action (Docket ID No. EPA–HQ–OAR–2018–0415).

G. What analysis of children's environmental health did we conduct?

The EPA does not believe the environmental health or safety risks addressed by this action present a disproportionate risk to children. The health and risk assessments for this action are contained in two reports titled *Residual Risk Assessment for the Miscellaneous Viscose Processes Source Category in Support of the 2020 Risk* and *Technology Review Final Rule* and *Residual Risk Assessment for the Cellulose Ethers Production Source Category in Support of the 2020 Risk and Technology Review Final Rule,* which can be found in the docket for this action.

VI. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at *https://www.epa.gov/laws-regulations/laws-and-executive-orders.*

A. Executive Orders 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is not a significant regulatory action and was, therefore, not submitted to the Office of Management and Budget (OMB) for review.

B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs

This action is not an Executive Order 13771 regulatory action because this action is not significant under Executive Order 12866.

C. Paperwork Reduction Act (PRA)

The information collection activities in this rule have been submitted for approval to the OMB under the PRA. The Information Collection Request (ICR) document that the EPA prepared has been assigned EPA ICR number 1974.11. You can find a copy of the ICR in the docket for this rule, and it is briefly summarized here. The information collection requirements are not enforceable until OMB approves them.

We are finalizing changes to the recordkeeping and reporting requirements for 40 CFR part 63, subpart UUUU, which eliminate the SSM reporting and SSM plan requirements, add periodic emissions testing, provide biofilter effluent conductivity as an alternative to monitoring pH, and require electronic submittal of notifications, semiannual reports, and performance test reports.

Respondents/affected entities: Respondents include facilities subject to the NESHAP for Cellulose Products Manufacturing (40 CFR part 63, subpart UUUU).

Respondent's obligation to respond: Mandatory (40 CFR part 63, subpart UUUU).

Estimated number of respondents: Eight.

Frequency of response: Initial notifications, reports of periodic performance tests, and semiannual compliance reports.

Total estimated burden: 7,256 labor hours (per year). Burden is defined at 5 CFR 1320.3(b).

Total estimated cost: $954,000 per year, including $834,000 per year in labor costs and $120,000 per year in annualized capital or operation and maintenance costs.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations in 40 CFR are listed in 40 CFR part 9. When OMB approves this ICR, the Agency will announce that approval in the **Federal Register** and publish a technical amendment to 40 CFR part 9 to display the OMB control number for the approved information collection activities contained in this final rule.

[4] Demographic groups included in the analysis are: White, African American, Native American, other races and multiracial, Hispanic or Latino, children 17 years of age and under, adults 18 to 64 years of age, adults 65 years of age and over, adults without a high school diploma, people living below the poverty level, people living two times the poverty level, and linguistically isolated people.

D. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. There are no small entities in this regulated industry and, as such, this action will not impose any requirements on small entities.

E. Unfunded Mandates Reform Act (UMRA)

This action does not contain an unfunded mandate of $100 million or more as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. The action imposes no enforceable duty on any state, local, or tribal governments, or the private sector.

F. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications as specified in Executive Order 13175. None of the facilities known to be engaged in the manufacture of cellulose products that would be affected by this action are owned or operated by tribal governments or located within tribal lands. Thus, Executive Order 13175 does not apply to this action.

H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

This action is not subject to Executive Order 13045 because it is not economically significant as defined in Executive Order 12866, and because the EPA does not believe the environmental health or safety risks addressed by this action present a disproportionate risk to children. This action's health and risk assessments are contained in sections III.A and IV.A of this preamble. Further documentation is provided in the following risk reports titled *Residual Risk Assessment for the Miscellaneous Viscose Processes Source Category in Support of the 2020 Risk and Technology Review Final Rule* and *Residual Risk Assessment for the Cellulose Ethers Production Source Category in Support of the 2020 Risk and Technology Review Final Rule,* which can be found in the docket for this action.

I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This action is not subject to Executive Order 13211 because it is not a significant regulatory action under Executive Order 12866.

J. National Technology Transfer and Advancement Act (NTTAA) and 1 CFR Part 51

This action involves technical standards. The EPA has decided to use three voluntary consensus standards (VCS). ASTM D6420–99 (Reapproved 2010), ''Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry,'' is used for the measurement of toluene and total organic HAP. This method employs a direct interface gas chromatograph/mass spectrometer to identify and quantify the 36 volatile organic compounds (VOC) (or sub-set of these compounds) listed on the ASTM website. This ASTM standard has been approved by the EPA as an alternative to EPA Method 18 when the target compounds are all known, and the target compounds are all listed in ASTM D6420 as measurable.

ASTM D5790–95 (Reapproved 2012), ''Standard Test Method for Measurement of Purgeable Organic Compounds in Water by Capillary Column Gas Chromatography/Mass Spectrometry,'' identifies and measures purgeable VOC. It has been validated for treated drinking water, wastewater, and groundwater. ASTM D5790–95 is acceptable as an alternative to EPA Method 624 and for the analysis of total organic HAP in wastewater samples. For wastewater analyses, this ASTM method should be used with the sampling procedures of EPA Method 25D or an equivalent method in order to be a complete alternative. This ASTM standard is validated for all of the 21 volatile organic HAP (including toluene) targeted by EPA Method 624 and is also validated for an additional 14 HAP not targeted by the EPA method.

ASTM D6348–12e1, ''Determination of Gaseous Compounds by Extractive Direct Interface Fourier Transform Infrared (FTIR) Spectroscopy,'' is an acceptable alternative to using EPA Method 320 with caveats requiring inclusion of selected annexes to the standard as mandatory. This test method provides the volume concentration of detected analytes. Converting the volume concentration to a mass emission rate using the compound's molecular weight, and the effluent volumetric flow rate, temperature, and pressure is useful for determining the impact of that compound to the atmosphere. When using ASTM D6348–12e, the following conditions must be met: (1) The test plan preparation and implementation in the Annexes to ASTM D 6348–03, Sections A1 through A8 are mandatory; and (2) in ASTM D6348–03, Annex A5 (Analyte Spiking Technique), the percent recovery (%R) must be determined for each target analyte (Equation A5.5). For the test data to be acceptable for a compound, %R must be greater than or equal to 70 percent and less than or equal to 130 percent. If the %R value does not meet this criterion for a target compound, the test data are not acceptable for that compound and the test must be repeated for that analyte (*i.e.,* the sampling and/or analytical procedure should be adjusted before a retest). The %R value for each compound must be reported in the test report, and all field measurements must be corrected with the calculated %R value for that compound by using the following equation: Reported Results = ((Measured Concentration in the Stack)/(%R)) × 100.

These four ASTM standards are available from ASTM International, 100 Barr Harbor Drive, Post Office Box C700, West Conshohocken, PA 19428–2959. See *https://www.astm.org/.*

While the EPA identified 14 other VCS as being potentially applicable, the Agency has decided not to use them. The use of these VCS would not be practical due to lack of equivalency, documentation, validation date, and other important technical and policy considerations. For further information, see the memorandum titled *Voluntary Consensus Standard Results for National Emission Standards for Hazardous Air Pollutants for Cellulose Products Manufacturing,* in the docket for this action (Docket ID Item No. EPA–HQ–OAR–2018–0415–0059).

K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes that this action does not have disproportionately high and adverse human health or environmental effects on minority populations, low income populations, and/or indigenous peoples, as specified in Executive Order 12898 (59 FR 7629, February 16, 1994). The documentation for this decision is contained in the technical reports titled *Risk and Technology Review—Analysis of Demographic Factors for Populations Living Near Miscellaneous Viscose Processes Facilities* and *Risk and*

Technology Review—Analysis of Demographic Factors for Populations Living Near Cellulose Ethers Production Facilities, which are located in the public docket for this action.

L. Congressional Review Act (CRA)

This action is subject to the CRA, and the EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action is not a ''major rule'' as defined by 5 U.S.C. 804(2).

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedures, Air pollution control, Hazardous substances, Incorporation by reference, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: March 11, 2020.

Andrew R. Wheeler,

Administrator.

For the reasons set forth in the preamble, the EPA amends 40 CFR part 63 as follows:

PART 63—NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart A—General Provisions

■ 2. Section 63.14 is amended by revising paragraphs (h)(72), (83), (85), (89), and (91) to read as follows:

§ 63.14 Incorporations by reference.

* * * * *

(h) * * *

(72) ASTM D5790–95 (Reapproved 2012), Standard Test Method for Measurement of Purgeable Organic Compounds in Water by Capillary Column Gas Chromatography/Mass Spectrometry, IBR approved for Table 4 to subpart UUUU.

* * * * *

(83) ASTM D6348–03, Standard Test Method for Determination of Gaseous Compounds by Extractive Direct Interface Fourier Transform Infrared (FTIR) Spectroscopy, including Annexes A1 through A8, Approved October 1, 2003, IBR approved for §§ 63.457(b), 63.1349, Table 4 to subpart DDDD, table 4 to subpart UUUU, table 4 subpart ZZZZ, and table 8 to subpart HHHHHHH.

* * * * *

(85) ASTM D6348–12e1, Standard Test Method for Determination of Gaseous Compounds by Extractive Direct Interface Fourier Transform Infrared (FTIR) Spectroscopy, Approved February 1, 2012, IBR approved for § 63.1571(a) and Table 4 to subpart UUUU.

* * * * *

(89) ASTM D6420–99, Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry, IBR approved for §§ 63.5799 and 63.5850.

* * * * *

(91) ASTM D6420–99 (Reapproved 2010), Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry, Approved October 1, 2010, IBR approved for § 63.670(j), Table 4 to subpart UUUU, and appendix A to this part: Method 325B.

* * * * *

Subpart UUUU—National Emission Standards for Hazardous Air Pollutants for Cellulose Products Manufacturing

■ 3. Section 63.5505 is amended by adding paragraph (f) to read as follows:

§ 63.5505 What emission limits, operating limits, and work practice standards must I meet?

* * * * *

(f) Carbon disulfide storage tanks part of a submerged unloading and storage operation subject to this part are not subject to 40 CFR part 60, subpart Kb (Standards of Performance for Volatile Organic Liquid Storage Vessels (Including Petroleum Liquid Storage Vessels) for Which Construction, Reconstruction, or Modification Commenced After July 23, 1984).

■ 4. Section 63.5515 is amended by revising paragraph (a), paragraph (b) introductory text, adding reserved paragraph (b)(2), and revising paragraph (c).

The revisions read as follows:

§ 63.5515 What are my general requirements for complying with this subpart?

(a) On or before December 29, 2020, for each existing source (and for each new or reconstructed source for which construction or reconstruction commenced on or before September 9, 2019), you must be in compliance with the emission limitations in this subpart at all times. For new and reconstructed sources for which construction or reconstruction commenced after September 9, 2019, you must be in compliance with the emission limits, operating limits, and work practice standards in this subpart at all times on July 2, 2020, or immediately upon startup, whichever is later.

(b) On or before December 29, 2020, for each existing source (and for each new or reconstructed source for which construction or reconstruction commenced on or before September 9, 2019), you must always operate and maintain your affected source, including air pollution control and monitoring equipment, according to the provisions in § 63.6(e)(1)(i). After December 29. 2020, for each existing source (and for each new or reconstructed source for which construction or reconstruction commenced on or before September 9, 2019), and after September 9, 2019, for new and reconstructed sources for which construction or reconstruction commenced after September 9, 2019, you must always operate and maintain your affected source, including air pollution control and monitoring equipment in a manner consistent with good air pollution control practices for minimizing emissions at least to the levels required by this subpart. The general duty to minimize emissions does not require you to make any further efforts to reduce emissions if levels required by the applicable standard have been achieved. Determination of whether a source is operating in compliance with operation and maintenance requirements will be based on information available to the Administrator which may include, but is not limited to, monitoring results, review of operation and maintenance procedures, review of operation and maintenance records, and inspection of the source.

* * * * *

(c) On or before December 29 2020, for each existing source (and for each new or reconstructed source for which construction or reconstruction commenced on or before September 9, 2019), you must maintain a written startup, shutdown, and malfunction (SSM) plan according the provisions in § 63.6(e)(3). For each such source, a SSM plan is not required after December 29, 2020. No SSM plan is required for any new or reconstruction source for

which construction or reconstruction commenced after September 9, 2019.

* * * * *

■ 5. Section 63.5535 is amended by revising paragraph (b), removing and reserving paragraph (c), and revising paragraphs (g)(1), (h)(1), and (i)(7).

The revisions read as follows:

§ 63.5535 What performance tests and other procedures must I use?

* * * * *

(b) You must conduct each performance test for continuous process vents and combinations of batch and continuous process vents based on representative performance (*i.e.,* performance based on normal operating conditions) of the affected source for the period being tested, according to the specific conditions in Table 4 to this subpart. Representative conditions exclude periods of startup and shutdown. You may not conduct performance tests during periods of malfunction. You must record the process information that is necessary to document operating conditions during the test and include in such record an explanation to support that such conditions represent normal operation. Upon request, you shall make available to the Administrator such records as may be necessary to determine the conditions of performance tests.

* * * * *

(g) * * *

(1) Viscose process affected sources that must use non-recovery control devices to meet the applicable emission limit in table 1 to this subpart must conduct an initial performance test of their non-recovery control devices according to the requirements in table 4 to this subpart to determine the control efficiency of their non-recovery control devices and incorporate this information in their material balance. Periodic performance tests must be conducted as specified in § 63.5541.

* * * * *

(h) * * *

(1) Cellulose ether affected sources that must use non-recovery control devices to meet the applicable emission limit in table 1 to this subpart must conduct an initial performance test of their non-recovery control devices according to the requirements in table 4 to this subpart to determine the control efficiency of their non-recovery control devices and incorporate this information in their material balance. Periodic performance tests must be conducted as specified in § 63.5541.

* * * * *

(i) * * *

(7) For biofilters, record the pressure drop across the biofilter beds, inlet gas temperature, and effluent pH or conductivity averaged over the same time period as the compliance demonstration while the vent stream is routed and constituted normally. Locate the pressure, temperature, and pH or conductivity sensors in positions that provide representative measurement of these parameters. Ensure the sample is properly mixed and representative of the fluid to be measured.

* * * * *

■ 6. Section 63.5541 is added to read as follows:

§ 63.5541 When must I conduct subsequent performance tests?

(a) For each affected source utilizing a non-recovery control device to comply with § 63.5515 that commenced construction or reconstruction before September 9, 2019, a periodic performance test must be performed by July 2, 2023, and subsequent tests no later than 60 months thereafter.

(b) For each affected source utilizing a non-recovery control device to comply with § 63.5515 that commences construction or reconstruction after September 9, 2019, a periodic performance test must be performed no later than 60 months after the initial performance test required by § 63.5535, and subsequent tests no later than 60 months thereafter.

■ 7. Section 63.5545 is amended by revising paragraphs (b)(1) and (e)(2) to read as follows:

§ 63.5545 What are my monitoring installation, operation, and maintenance requirements?

* * * * *

(b) * * *

(1) Ongoing operation and maintenance procedures in accordance with the general requirements of §§ 63.8(c)(3) and (4)(ii), 63.5515(b), and 63.5580(c)(6);

* * * * *

(e) * * *

(2) You must conduct a performance evaluation of each CEMS according to the requirements in § 63.8, Procedure 1 of 40 CFR part 60, appendix F, and according to the applicable performance specification listed in paragraphs (e)(1)(i) through (iv) of this section.

* * * * *

■ 8. Section 63.5555 is amended by revising paragraph (d) to read as follows:

§ 63.5555 How do I demonstrate continuous compliance with the emission limits, operating limits, and work practice standards?

* * * * *

(d) For each affected source that commenced construction or reconstruction before September 9, 2019, on or before December 29, 2020, deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.5515(b). The Administrator will determine whether deviations that occur on or before December 29, 2020, and during a period you identify as a startup, shutdown, or malfunction are violations, according to the provisions in § 63.5515(b). This section no longer applies after December 30, 2020. For new sources that commence construction or reconstruction after September 9, 2019, this section does not apply.

■ 9. Section 63.5575 is revised to read as follows:

§ 63.5575 What notifications must I submit and when?

You must submit each notification in Table 7 to this subpart that applies to you by the date specified in Table 7 to this subpart. Initial notifications and Notification of Compliance Status Reports shall be electronically submitted in portable document format (PDF) following the procedure specified in § 63.5580(g).

■ 10. Section 63.5580 is amended by:

■ a. Revising paragraphs (b) introductory text and (b)(2) and (4);

■ b. Adding paragraph (b)(6);

■ c. Revising paragraphs (c)(4), (e) introductory text, and (e)(2);

■ d. Adding paragraphs (e)(14) and (g) through (k).

The revisions and additions read as follows:

§ 63.5580 What reports must I submit and when?

* * * * *

(b) Unless the Administrator has approved a different schedule for submitting reports under § 63.10, you must submit each compliance report by the date in Table 8 to this subpart and according to the requirements in paragraphs (b)(1) through (6) of this section.

* * * * *

(2) The first compliance report must be submitted no later than August 31 or February 28, whichever date follows the end of the first calendar half after the

compliance date that is specified for your affected source in § 63.5495.

* * * * *

(4) Each subsequent compliance report must be submitted no later than August 31 or February 28, whichever date is the first date following the end of the semiannual reporting period.

* * * * *

(6) Prior to December 29, 2020, all compliance reports submitted by mail must be postmarked or delivered no later than the dates specified in paragraphs (b)(1) through (5). Beginning on December 29, 2020, you must submit all compliance reports following the procedure specified in paragraph (g) of this section by the dates specified in paragraphs (b)(1) through (5).

* * * * *

(c) * * *

(4) Before December 30, 2020, for each existing source (and for each new or reconstructed source for which construction or reconstruction commenced on or before September 9, 2019), if you had a startup, shutdown, or malfunction during the reporting period and you took actions consistent with your SSM plan, the compliance report must include the information in § 63.10(d)(5)(i). After December 29, 2020, you are no longer required to report the information in § 63.10(d)(5)(i). No SSM plan is required for any new or reconstruction source for which construction or reconstruction commenced after September 9, 2019.

* * * * *

(e) For each deviation from an emission limit or operating limit occurring at an affected source where you are using a CMS to demonstrate continuous compliance with the emission limit or operating limit in this subpart (see Tables 5 and 6 to this subpart), you must include the information in paragraphs (c)(1) through (4) and (e)(1) through (14) of this section. This includes periods of SSM.

* * * * *

(2) The date, time, and duration that each CMS was inoperative, except for zero (low-level) and high-level checks.

* * * * *

(14) An estimate of the quantity of each regulated pollutant emitted over any emission limit, and a description of the method used to estimate the emissions.

* * * * *

(g) If you are required to submit notifications or reports following the procedure specified in this paragraph, you must submit notifications or reports to the EPA via the Compliance and Emissions Data Reporting Interface (CEDRI), which can be accessed through the EPA's Central Data Exchange (CDX) (*https://cdx.epa.gov/*). Notifications must be submitted as PDFs to CEDRI. You must use the semi-annual compliance report template on the CEDRI website (*https://www.epa.gov/electronic-reporting-air-emissions/compliance-and-emissions-data-reporting-interface-cedri*) for this subpart. The date report templates become available will be listed on the CEDRI website. The semi-annual compliance report must be submitted by the deadline specified in this subpart, regardless of the method in which the report is submitted. If you claim some of the information required to be submitted via CEDRI is confidential business information (CBI), submit a complete report, including information claimed to be CBI, to the EPA. The report must be generated using the appropriate form on the CEDRI website. Submit the file on a compact disc, flash drive, or other commonly used electronic storage medium and clearly mark the medium as CBI. Mail the electronic medium to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404–02, 4930 Old Page Rd., Durham, NC 27703. The same file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described earlier in this paragraph.

(h) Within 60 days after the date of completing each performance test required by this subpart, you must submit the results of the performance test following the procedures specified in paragraphs (h)(1) through (3) of this section.

(1) *Data collected using test methods supported by the EPA's Electronic Reporting Tool (ERT) as listed on the EPA's ERT website (https://www.epa.gov/electronic-reporting-air-emissions/electronic-reporting-tool-ert) at the time of the test.* Submit the results of the performance test to the EPA via CEDRI, which can be accessed through the EPA's CDX (*https://cdx.epa.gov/*). The data must be submitted in a file format generated through the use of the EPA's ERT. Alternatively, you may submit an electronic file consistent with the extensible markup language (XML) schema listed on the EPA's ERT website.

(2) *Data collected using test methods that are not supported by the EPA's ERT as listed on the EPA's ERT website at the time of the test.* The results of the performance test must be included as an attachment in the ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT website. Submit the ERT generated package or alternative file to the EPA via CEDRI.

(3) *Confidential business information (CBI).* If you claim some of the information submitted under this paragraph (h) is CBI, you must submit a complete file, including information claimed to be CBI, to the EPA. The file must be generated through the use of the EPA's ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT website. Submit the file on a compact disc, flash drive, or other commonly used electronic storage medium and clearly mark the medium as CBI. Mail the electronic medium to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404–02, 4930 Old Page Rd., Durham, NC 27703. The same file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described in paragraph (h) of this section.

(i) Within 60 days after the date of completing each CMS performance evaluation (as defined in § 63.2), you must submit the results of the performance evaluation following the procedures specified in paragraphs (i)(1) through (3) of this section.

(1) *Performance evaluations of CMS measuring relative accuracy test audit (RATA) pollutants that are supported by the EPA's ERT as listed on the EPA's ERT website at the time of the evaluation.* Submit the results of the performance evaluation to the EPA via CEDRI, which can be accessed through the EPA's CDX. The data must be submitted in a file format generated through the use of the EPA's ERT. Alternatively, you may submit an electronic file consistent with the XML schema listed on the EPA's ERT website.

(2) *Performance evaluations of CMS measuring RATA pollutants that are not supported by the EPA's ERT as listed on the EPA's ERT website at the time of the evaluation.* The results of the performance evaluation must be included as an attachment in the ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT website. Submit the ERT generated package or alternative file to the EPA via CEDRI.

(3) *Confidential business information (CBI).* If you claim some of the information submitted under this paragraph (i) is CBI, you must submit a complete file, including information claimed to be CBI, to the EPA. The file must be generated through the use of the EPA's ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT website. Submit the file on a compact disc, flash drive, or

other commonly used electronic storage medium and clearly mark the medium as CBI. Mail the electronic medium to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404–02, 4930 Old Page Rd., Durham, NC 27703. The same file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described in this paragraph (i).

(j) If you are required to electronically submit a report or notification through CEDRI in the EPA's CDX, you may assert a claim of EPA system outage for failure to timely comply with the reporting requirement. To assert a claim of EPA system outage, you must meet the requirements outlined in paragraphs (j)(1) through (7) of this section.

(1) You must have been or will be precluded from accessing CEDRI and submitting a required report within the time prescribed due to an outage of either the EPA's CEDRI or CDX systems.

(2) The outage must have occurred within the period of time beginning 5 business days prior to the date that the submission is due.

(3) The outage may be planned or unplanned.

(4) You must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or has caused a delay in reporting.

(5) You must provide to the Administrator a written description identifying:

(i) The date(s) and time(s) when CDX or CEDRI was accessed and the system was unavailable;

(ii) A rationale for attributing the delay in reporting beyond the regulatory deadline to EPA system outage;

(iii) A description of measures taken or to be taken to minimize the delay in reporting; and

(iv) The date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported.

(6) The decision to accept the claim of the EPA system outage and allow an extension to the reporting deadline is solely within the discretion of the Administrator.

(7) In any circumstance, the report must be submitted electronically as soon as possible after the outage is resolved.

(k) If you are required to electronically submit a report through CEDRI in the EPA's CDX, you may assert a claim of force majeure for failure to timely comply with the reporting requirement. To assert a claim of force majeure, you must meet the requirements outlined in paragraphs (k)(1) through (5) of this section.

(1) You may submit a claim if a force majeure event is about to occur, occurs, or has occurred or there are lingering effects from such an event within the period of time beginning five business days prior to the date the submission is due. For the purposes of this section, a force majeure event is defined as an event that will be or has been caused by circumstances beyond the control of the affected facility, its contractors, or any entity controlled by the affected facility that prevents you from complying with the requirement to submit a report electronically within the time period prescribed. Examples of such events are acts of nature (*e.g.,* hurricanes, earthquakes, or floods), acts of war or terrorism, or equipment failure or safety hazard beyond the control of the affected facility (*e.g.,* large scale power outage).

(2) You must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or has caused a delay in reporting.

(3) You must provide to the Administrator:

(i) A written description of the force majeure event;

(ii) A rationale for attributing the delay in reporting beyond the regulatory deadline to the force majeure event;

(iii) A description of measures taken or to be taken to minimize the delay in reporting; and

(iv) The date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported.

(4) The decision to accept the claim of force majeure and allow an extension to the reporting deadline is solely within the discretion of the Administrator.

(5) In any circumstance, the reporting must occur as soon as possible after the force majeure event occurs.

■ 11. Section 63.5590 is amended by adding paragraph (e) to read as follows:

§ 63.5590 In what form and how long must I keep my records?

* * * * *

(e) Any records required to be maintained by this part that are submitted electronically via EPA's CEDRI may be maintained in electronic format. This ability to maintain electronic copies does not affect the requirement for facilities to make records, data, and reports available upon request to a delegated air agency or the EPA as part of an on-site compliance evaluation.

■ 12. Table 2 to Subpart UUUU is revised to read as follows:

Table 2 to Subpart UUUU of Part 63—Operating Limits

As required in § 63.5505(b), you must meet the appropriate operating limits in the following table:

For the following control technique . . .	you must . . .
1. condenser	maintain the daily average condenser outlet gas or condensed liquid temperature no higher than the value established during the compliance demonstration.
2. thermal oxidizer	a. for periods of normal operation, maintain the daily average thermal oxidizer firebox temperature no lower than the value established during the compliance demonstration; b. after December 29, 2020, for existing sources (and new or reconstructed sources for which construction or reconstruction commenced on or before September 9, 2019), and on July 2, 2020, or immediately upon startup, whichever is later for new or reconstructed sources for which construction or reconstruction commenced after September 9, 2019, maintain documentation for periods of startup demonstrating that the oxidizer was properly operating (*e.g.,* firebox temperature had reached the setpoint temperature) prior to emission unit startup.
3. water scrubber	a. for periods of normal operation, maintain the daily average scrubber pressure drop and scrubber liquid flow rate within the range of values established during the compliance demonstration;

For the following control technique . . .	you must . . .
	b. after December 29, 2020, for existing sources (and new or reconstructed sources for which construction or, reconstruction commenced on or before September 9, 2019), and on July 2, 2020, or immediately upon startup, whichever is later for new or reconstructed sources for which construction or reconstruction commenced after September 9, 2019, maintain documentation for periods of startup and shutdown to confirm that the scrubber is operating properly prior to emission unit startup and continues to operate properly until emission unit shutdown is complete. Appropriate startup and shutdown operating parameters may be based on equipment design, manufacturer's recommendations, or other site-specific operating values established for normal operating periods.
4. caustic scrubber	a. for periods of normal operation, maintain the daily average scrubber pressure drop, scrubber liquid flow rate, and scrubber liquid pH, conductivity, or alkalinity within the range of values established during the compliance demonstration; b. after December 29, 2020, for existing sources (and new or reconstructed sources for which construction or reconstruction commenced on or before September 9, 2019), and on July 2, 2020, or immediately upon startup, whichever is later for new or reconstructed sources for which construction or reconstruction commenced after September 9, 2019, maintain documentation for periods of startup and shutdown to confirm that the scrubber is operating properly prior to emission unit startup and continues to operate properly until emission unit shutdown is complete. Appropriate startup and shutdown operating parameters may be based on equipment design, manufacturer's recommendations, or other site-specific operating values established for normal operating periods.
5. flare	maintain the presence of a pilot flame.
6. biofilter	maintain the daily average biofilter inlet gas temperature, biofilter effluent pH or conductivity, and pressure drop within the operating values established during the compliance demonstration.
7. carbon absorber	maintain the regeneration frequency, total regeneration adsorber stream mass or volumetric flow during carbon bed regeneration, and temperature of the carbon bed after regeneration (and within 15 minutes of completing any cooling cycle(s)) for each regeneration cycle within the values established during the compliance demonstration.
8. oil absorber	maintain the daily average absorption liquid flow, absorption liquid temperature, and steam flow within the values established during the compliance demonstration.
9. any of the control techniques specified in this table.	if using a CEMS, maintain the daily average control efficiency of each control device no lower than the value established during the compliance demonstration.
10. any of the control techniques specified in this table.	a. if you wish to establish alternative operating parameters, submit the application for approval of the alternative operating parameters no later than the notification of the performance test or CEMS performance evaluation or no later than 60 days prior to any other initial compliance demonstration; b. the application must include: Information justifying the request for alternative operating parameters (such as the infeasibility or impracticality of using the operating parameters in this final rule); a description of the proposed alternative control device operating parameters; the monitoring approach; the frequency of measuring and recording the alternative parameters; how the operating limits are to be calculated; and information documenting that the alternative operating parameters would provide equivalent or better assurance of compliance with the standard; c. install, operate, and maintain the alternative parameter monitoring systems in accordance with the application approved by the Administrator; d. establish operating limits during the initial compliance demonstration based on the alternative operating parameters included in the approved application; and e. maintain the daily average alternative operating parameter values within the values established during the compliance demonstration.
11. alternative control technique.	a. submit for approval no later than the notification of the performance test or CEMS performance evaluation or no later than 60 days prior to any other initial compliance demonstration a proposed site-specific plan that includes: A description of the alternative control device; test results verifying the performance of the control device; the appropriate operating parameters that will be monitored; and the frequency of measuring and recording to establish continuous compliance with the operating limits; b. install, operate, and maintain the parameter monitoring system for the alternative control device in accordance with the plan approved by the Administrator; c. establish operating limits during the initial compliance demonstration based on the operating parameters for the alternative control device included in the approved plan; and d. maintain the daily average operating parameter values for the alternative control technique within the values established during the compliance demonstration.

■ 13. Table 3 to Subpart UUUU is revised to read as follows:

Table 3 to Subpart UUUU of Part 63—Initial Compliance With Emission Limits and Work Practice Standards

As required in §§ 63.5530(a) and 63.5535(g) and (h), you must demonstrate initial compliance with the appropriate emission limits and work practice standards according to the requirements in the following table:

For . . .	at . . .	for the following emission limit or work practice standard . . .	you have demonstrated initial compliance if . . .
1. the sum of all viscose process vents	a. each existing cellulose food casing operation	i. reduce total uncontrolled sulfide emissions (reported as carbon disulfide) by at least 25 percent based on a 6-month rolling average; ii. for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and iii. comply with the work practice standard for closed-vent systems	(1) the average uncontrolled total sulfide emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 25 percent; (2) you have a record of the range of operating parameter values over the month-long compliance demonstration during which the average uncontrolled total sulfide emissions were reduced by at least 25 percent; (3) you prepare a material balance that includes the pertinent data used to determine the percent reduction of total sulfide emissions; and (4) you comply with the initial compliance requirements for closed-vent systems.
	b. each new cellulose food casing operation	i. reduce total uncontrolled sulfide emissions (reported as carbon disulfide) by at least 75 percent based on a 6-month rolling average; ii. for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and iii. comply with the work practice standard for closed-vent systems.	(1) the average uncontrolled total sulfide emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 75 percent; (2) you have a record of the range of operating parameter values over the month-long compliance demonstration during which the average uncontrolled total sulfide emissions were reduced by at least 75 percent; (3) you prepare a material balance that includes the pertinent data used to determine the percent reduction of total sulfide emissions; and (4) you comply with the initial compliance requirements for closed-vent systems.
	c. each existing rayon operation	i. reduce total uncontrolled sulfide emissions (reported as carbon disulfide) by at least 35 percent within 3 years after the effective date based on a 6-month rolling average; for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and comply with the work practice standard for closed-vent systems; and	(1) the average uncontrolled total sulfide emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 35 percent within 3 years after the effective date; (2) you have a record of the average operating parameter values over the month-long compliance demonstration during which the average uncontrolled total sulfide emissions were reduced by at least 35 percent; (3) you prepare a material balance that includes the pertinent data used to determine the percent reduction of total sulfide emissions; and (4) you comply with the initial compliance requirements for closed-vent systems; and
		ii. reduce total uncontrolled sulfide emissions (reported as carbon disulfide) by at least 40 percent within 8 years after the effective date based on a 6-month rolling average; for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and comply with the work practice standard for closed-vent systems.	(1) the average uncontrolled total sulfide emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 40 percent within 8 years after the effective date; (2) you have a record of the average operating parameter values over the month-long compliance demonstration during which the average uncontrolled total sulfide emissions were reduced by at least 40 percent; (3) you prepare a material balance that includes the pertinent data used to determine the percent reduction of the total sulfide emissions; and (4) you comply with the initial compliance requirements for closed-vent systems.

For . . .	at . . .	for the following emission limit or work practice standard . . .	you have demonstrated initial compliance if . . .
	d. each new rayon operation	i. reduce total uncontrolled sulfide emissions (reported as carbon disulfide) by at least 75 percent; based on a 6-month rolling average; ii. for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and iii. comply with the work practice standard for closed-vent systems.	(1) the average uncontrolled total sulfide emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 75 percent; (2) you have a record of the average operating parameter values over the month-long compliance demonstration during which the average uncontrolled total sulfide emissions were reduced by at least 75 percent; (3) you prepare a material balance that includes the pertinent data used to determine the percent reduction of total sulfide missions; and (4) you comply with the initial compliance requirements for closed-vent systems.
	e. each existing or new cellulosic sponge operation	i. reduce total uncontrolled sulfide emissions (reported as carbon disulfide) by at least 75 percent based on a 6-month rolling average; ii. for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and iii. comply with the work practice standard for closed-vent systems.	(1) the average uncontrolled total sulfide emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 75 percent; (2) you have a record of the average operating parameter values over the month-long compliance demonstration during which the average uncontrolled total sulfide emissions were reduced by at least 75 percent; (3) you prepare a material balance that includes the pertinent data used to determine and the percent reduction of total sulfide emissions; and (4) you comply with the initial compliance requirements for closed-vent systems.
	f. each existing or new cellophane operation	i. reduce total uncontrolled sulfide emissions (reported as carbon disulfide) by at least 75 percent based on a 6-month rolling average; ii. for each vent stream that you control using a control device (except for retractable hoods over sulfuric acid baths at a cellophane operation), route the vent stream through a closed-vent system to the control device; and iii. comply with the work practice standard for closed-vent systems.	(1) the average uncontrolled total sulfide emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 75 percent; (2) you have a record of the average operating parameter values over the month-long compliance demonstration during which the average uncontrolled total sulfide emissions were reduced by at least 75 percent; (3) you prepare a material balance that includes the pertinent data used to determine the percent reduction of total sulfide emissions; and (4) you comply with the initial compliance requirements for closed-vent systems.
2. the sum of all solvent coating process vents	a. each existing or new cellophane operation	i. reduce uncontrolled toluene emissions by at least 95 percent based on a 6-month rolling average; ii. for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and iii. comply with the work practice standard for closed-vent systems.	(1) the average uncontrolled toluene emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 95 percent; (2) you have a record of the average operating parameter values over the month-long compliance demonstration during which the average uncontrolled toluene emissions were reduced by at least 95 percent; (3) you prepare a material balance that includes the pertinent data used to determine the percent reduction of toluene emissions; and (4) you comply with the initial compliance requirements for closed-vent systems.

For . . .	at . . .	for the following emission limit or work practice standard . . .	you have demonstrated initial compliance if . . .
3. the sum of all cellulose ether process vents	a. each existing or new cellulose ether operation using a performance test to demonstrate initial compliance; or	i. reduce total uncontrolled organic HAP emissions by at least 99 percent; ii. for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and iii. comply with the work practice standard for closed-vent systems.	(1) average uncontrolled total organic HAP emissions, measured during the performance test or determined using engineering estimates are reduced by at least 99 percent; (2) you have a record of the average operating parameter values over the performance test during which the average uncontrolled total organic HAP emissions were reduced by at least 99 percent; and (3) you comply with the initial compliance requirements for closed-vent systems.
	b. each existing or new cellulose ether operation using a material balance compliance demonstration to demonstrate initial compliance	i. reduce total uncontrolled organic HAP emissions by at least 99 percent based on a 6-month rolling average; ii. for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and iii. comply with the work practice standard for closed-vent systems.	(1) average uncontrolled total organic HAP emissions, determined during the month-long compliance demonstration or using engineering estimates are reduced by at least 99 percent; (2) you have a record of the average operation parameter values over the month-long compliance demonstration during which the average uncontrolled total organic HAP emissions were reduced by at least 99 percent; (3) you prepare a material balance that includes the pertinent data used to determine the percent reduction of total organic HAP emissions; (4) if you use extended cookout to comply, you measure the HAP charged to the reactor, record the grade of product produced, and then calculate reactor emissions prior to extended cookout by taking a percentage of the total HAP charged.
4. closed-loop systems	each existing or new cellulose ether operation	operate and maintain the closed-loop system for cellulose ether operations.	you have a record certifying that a closed-loop system is in use for cellulose ether operations.
5. each carbon disulfide unloading and storage operation	a. each existing or new viscose process affected source	i. reduce uncontrolled carbon disulfide emissions by at least 83 percent from unloading and storage operations based on a 6-month rolling average if you use an alternative control technique not listed in this table for carbon disulfide unloading and storage operations; if using a control device to reduce emissions, route emissions through a closed-vent system to the control device; and comply with the work practice standard for closed-vent systems;	(1) you have a record documenting the 83-percent reduction in uncontrolled carbon disulfide emissions; and (2) if venting to a control device to reduce emissions, you comply with the initial compliance requirements for closed-vent systems;
		ii. reduce uncontrolled carbon disulfide by at least 0.14 percent from viscose process vents based on a 6-month rolling average; for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and comply with the work practice standard for closed-vent systems;	(1) you comply with the initial compliance requirements for viscose process vents at existing or new cellulose food casing, rayon, cellulosic sponge, or cellophane operations, as applicable; (2) the 0.14-percent reduction must be in addition to the reduction already required for viscose process vents at existing or new cellulose food casing, rayon, cellulosic sponge, or cellophane operations, as applicable; and (3) you comply with the initial compliance requirements for closed-vent systems;
		iii. install a nitrogen unloading and storage system; or	you have a record certifying that a nitrogen unloading and storage system is in use; or

For . . .	at . . .	for the following emission limit or work practice standard . . .	you have demonstrated initial compliance if . . .
		iv. install a nitrogen unloading system; reduce uncontrolled carbon disulfide by at least 0.045 percent from viscose process vents based on a 6-month rolling average; for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and comply with the work practice standard for closed-vent systems.	(1) you have a record certifying that a nitrogen unloading system is in use; (2) you comply with the initial compliance requirements for viscose process vents at existing or new cellulose food casing, rayon, cellulosic sponge, or cellophane operations, as applicable; (3) the 0.045-percent reduction must be in addition to the reduction already required for viscose process vents at cellulose food casing, rayon, cellulosic sponge, or cellophane operations, as applicable; and (4) you comply with the initial compliance requirements for closed-vent systems.
6. each toluene storage vessel	a. each existing or new cellophane operation	i. reduce uncontrolled toluene emissions by at least 95 percent based on a 6-month rolling average; ii. if using a control device to reduce emissions, route the emissions through a closed-vent system to the control device; and iii. comply with the work practice standard for closed-vent systems.	(1) the average uncontrolled toluene emissions, determined during the month-long compliance demonstration or using engineering assessments, are reduced by at least 95 percent; (2) you have a record of the average operating parameter values over the month-long compliance demonstration during which the average uncontrolled toluene emissions were reduced by at least 95 percent; (3) you prepare a material balance that includes the pertinent data used to determine the percent reduction of toluene emissions; and (4) if venting to a control device to reduce emissions, you comply with the initial compliance requirements for closed-vent systems.
7. equipment leaks	a. each existing or new cellulose ether operation	i. comply with the applicable equipment leak standards of §§ 63.162 through 63.179; or	you comply with the applicable requirements described in the Notification of Compliance Status Report provisions in § 63.182(a)(2) and (c)(1) through (3), except that references to the term ''process unit'' mean ''cellulose ether process unit'' for the purposes of this subpart; or
		ii. comply with the applicable equipment leak standards of §§ 63.1021 through 63.1027.	you comply with the applicable requirements described in the Initial Compliance Status Report provisions of § 63.1039(a), except that references to the term ''process unit'' mean ''cellulose ether process unit'' for the purposes of this subpart.
8. all sources of wastewater emissions	each existing or new cellulose ether operation	comply with the applicable wastewater provisions of § 63.105 and §§ 63.132 through 63.140.	you comply with the applicability and Group 1/Group 2 determination provisions of § 63.144 and the initial compliance provisions of §§ 63.105 and 63.145.
9. liquid streams in open systems	each existing or new cellulose ether operation	comply with the applicable provisions of § 63.149, except that references to ''chemical manufacturing process unit'' mean ''cellulose ether process unit'' for the purposes of this subpart.	you install emission suppression equipment and conduct an initial inspection according to the provisions of §§ 63.133 through 63.137.
10. closed-vent system used to route emissions to a control device	a. each existing or new affected source	i. conduct annual inspections, repair leaks, and maintain records as specified in § 63.148.	(1) you conduct an initial inspection of the closed-vent system and maintain records according to § 63.148; (2) you prepare a written plan for inspecting unsafe-to-inspect and difficult-to-inspect equipment according to § 63.148(g)(2) and (h)(2); and (3) you repair any leaks and maintain records according to § 63.148.

For . . .	at . . .	for the following emission limit or work practice standard . . .	you have demonstrated initial compliance if . . .
11. closed-vent system containing a bypass line that could divert a vent stream away from a control device, except for equipment needed for safety purposes (described in § 63.148(f)(3))	a. each existing or new affected source	i. install, calibrate, maintain, and operate a flow indicator as specified in § 63.148(f)(1); or	you have a record documenting that you installed a flow indicator as specified in Table 1 to this subpart; or
		ii. secure the bypass line valve in the closed position with a car-seal or lock-and-key type configuration and inspect the seal or closure mechanism at least once per month as specified in § 63.148(f)(2)	you have record documenting that you have secured the bypass line valve as specified in Table 1 to this subpart.
12. heat exchanger system that cools process equipment or materials in the process unit	a. each existing or new affected source	i. monitor and repair the heat exchanger system according to § 63.104(a) through (e), except that references to ''chemical manufacturing process unit'' mean ''cellulose food casing, rayon, cellulosic sponge, cellophane, or cellulose ether process unit'' for the purposes of this subpart.	(1) you determine that the heat exchanger system is exempt from monitoring requirements because it meets one of the conditions in § 63.104(a)(1) through (6), and you document this finding in your Notification of Compliance Status Report; or (2) if your heat exchanger system is not exempt, you identify in your Notification of Compliance Status Report the HAP or other representative substance that you will monitor, or you prepare and maintain a site-specific plan containing the information required by § 63.104(c)(1)(i) through (iv) that documents the procedures you will use to detect leaks by monitoring surrogate indicators of the leak.

■ 14. Table 4 to Subpart UUUU is revised to read as follows:

Table 4 to Subpart UUUU of Part 63—Requirements for Performance Tests

As required in §§ 63.5530(b) and 63.5535(a), (b), (g)(1), and (h)(1), you must conduct performance tests, other initial compliance demonstrations, and CEMS performance evaluations and establish operating limits according to the requirements in the following table:

For . . .	at . . .	you must . . .	using . . .	according to the following requirements . . .
1. the sum of all process vents.	a. each existing or new affected source.	i. select sampling port's location and the number of traverse points;	EPA Method 1 or 1A in appendix A–1 to part 60 of this chapter;	sampling sites must be located at the inlet and outlet to each control device;
		ii. determine velocity and volumetric flow rate;	EPA Method 2, 2A, 2C, 2D, 2F, or 2G in appendices A–1 and A–2 to part 60 of this chapter;	you may use EPA Method 2A, 2C, 2D, 2F, or 2G as an alternative to using EPA Method 2, as appropriate;
		iii. conduct gas analysis; and,	(1) EPA Method 3, 3A, or 3B in appendix A–2 to part 60 of this chapter; or,	you may use EPA Method 3A or 3B as an alternative to using EPA Method 3; or,
			(2) ASME PTC 19.10–1981—Part 10 (incorporated by reference—see § 63.14); and,	you may use ASME PTC 19.10–1981—Part 10 as an alternative to using the manual procedures (but not instrumental procedures) in EPA Method 3B.
		iv. measure moisture content of the stack gas.	EPA Method 4 in appendix A–3 to part 60 of this chapter.	

For . . .	at . . .	you must . . .	using . . .	according to the following requirements . . .
2. the sum of all viscose process vents.	a. each existing or new viscose process source.	i. measure total sulfide emissions.	(1) EPA Method 15 in appendix A–5 to part 60 of this chapter; or	(a) you must conduct testing of emissions at the inlet and outlet of each control device; (b) you must conduct testing of emissions from continuous viscose process vents and combinations of batch and continuous viscose process vents at normal operating conditions, as specified in § 63.5535; (c) you must conduct testing of emissions from batch viscose process vents as specified in § 63.490(c), except that the emission reductions required for process vents under this subpart supersede the emission reductions required for process vents under subpart U of this part; and (d) you must collect CPMS data during the period of the initial compliance demonstration and determine the CPMS operating limit during the period of the initial compliance demonstration.
			(2) carbon disulfide and/or hydrogen sulfide CEMS, as applicable;	(a) you must measure emissions at the inlet and outlet of each control device using CEMS; (b) you must install, operate, and maintain the CEMS according to the applicable performance specification (PS–7, PS–8, PS–9, or PS–15) of appendix B to part 60 of this chapter; and (c) you must collect CEMS emissions data at the inlet and outlet of each control device during the period of the initial compliance demonstration and determine the CEMS operating limit during the period of the initial compliance demonstration.
3. the sum of all solvent coating process vents.	a. each existing or new cellophane operation.	i. measure toluene emissions.	(1) EPA Method 18 in appendix A–6 to part 60 of this chapter, or Method 320 in appendix A to part 63; or	(a) you must conduct testing of emissions at the inlet and outlet of each control device; (b) you may use EPA Method 18 or 320 to determine the control efficiency of any control device for organic compounds; for a combustion device, you must use only HAP that are present in the inlet to the control device to characterize the percent reduction across the combustion device; (c) you must conduct testing of emissions from continuous solvent coating process vents and combinations of batch and continuous solvent coating process vents at normal operating conditions, as specified in § 63.5535; (d) you must conduct testing of emissions from batch solvent coating process vents as specified in § 63.490(c), except that the emission reductions required for process vents under this subpart supersede the emission reductions required for process vents under subpart U of this part; and (e) you must collect CPMS data during the period of the initial compliance demonstration and determine the CPMS operating limit during the initial compliance demonstration.

For . . .	at . . .	you must . . .	using . . .	according to the following requirements . . .
			(2) ASTM D6420–99 (Reapproved 2010) (incorporated by reference—see § 63.14); or	(a) you must conduct testing of emissions at the inlet and outlet of each control device; (b) you may use ASTM D6420–99 (Reapproved 2010) as an alternative to EPA Method 18 only where: The target compound(s) are known and are listed in ASTM D6420 as measurable; this ASTM should not be used for methane and ethane because their atomic mass is less than 35; ASTM D6420 should never be specified as a total VOC method; (c) you must conduct testing of emissions from continuous solvent coating process vents and combinations of batch and continuous solvent coating process vents at normal operating conditions, as specified in § 63.5535; (d) you must conduct testing of emissions from batch solvent coating process vents as specified in § 63.490(c), except that the emission reductions required for process vents under this subpart supersede the emission reductions required for process vents under subpart U of this part; and (e) you must collect CPMS data during the period of the initial compliance demonstration and determine the CPMS operating limit during the period of the initial compliance demonstration.

For . . .	at . . .	you must . . .	using . . .	according to the following requirements . . .
			(3) ASTM D6348–12e1 (incorporated by reference—see § 63.14).	(a) you must conduct testing of emissions at the inlet and outlet of each control device; (b) you may use ASTM D6348–12e1 as an alternative to EPA Method 320 only where the following conditions are met: (1) The test plan preparation and implementation in the Annexes to ASTM D 6348–03, Sections A1 through A8 are mandatory; and (2) in ASTM D6348–03 Annex A5 (Analyte Spiking Technique), the percent recovery (%R) must be determined for each target analyte (Equation A5.5). In order for the test data to be acceptable for a compound, %R must be greater than or equal to 70 percent and less than or equal to 130 percent. If the %R value does not meet this criterion for a target compound, the test data are not acceptable for that compound and the test must be repeated for that analyte (*i.e.,* the sampling and/or analytical procedure should be adjusted before a retest). The %R value for each compound must be reported in the test report, and all field measurements must be corrected with the calculated %R value for that compound by using the following equation: Reported Results = ((Measured Concentration in the Stack)/(%R)) × 100. ASTM D6348–03 is incorporated by reference, see § 63.14. (c) you must conduct testing of emissions from continuous solvent coating process vents and combinations of batch and continuous solvent coating process vents at normal operating conditions, as specified in § 63.5535; (d) you must conduct testing of emissions from batch solvent coating process vents as specified in § 63.490(c), except that the emission reductions required for process vents under this subpart supersede the emission reductions required for process vents under subpart U of this part; and (e) you must collect CPMS data during the period of the initial compliance demonstration and determine the CPMS operating limit during the period of the initial compliance demonstration.

For . . .	at . . .	you must . . .	using . . .	according to the following requirements . . .
4. the sum of all cellulose ether process vents.	a. each existing or new cellulose ether operation.	i. measure total organic HAP emissions.	(1) EPA Method 18 in appendix A–6 to part 60 of this chapter or Method 320 in appendix A to this part, or	(a) you must conduct testing of emissions at the inlet and outlet of each control device; (b) you may use EPA Method 18 or 320 to determine the control efficiency of any control device for organic compounds; for a combustion device, you must use only HAP that are present in the inlet to the control device to characterize the percent reduction across the combustion device; (c) you must conduct testing of emissions from continuous cellulose ether process vents and combinations of batch and continuous cellulose ether process vents at normal operating conditions, as specified in § 63.5535; (d) you must conduct testing of emissions from batch cellulose ether process vents as specified in § 63.490(c), except that the emission reductions required for process vents under this subpart supersede the emission reductions required for process vents under subpart U of this part; and (e) you must collect CPMS data during the period of the initial performance test and determine the CPMS operating limit during the period of the initial performance test.
			(2) ASTM D6420–99 (Reapproved 2010); or	(a) you must conduct testing of emissions at the inlet and outlet of each control device; (b) you may use ASTM D6420–99 (Reapproved 2010) as an alternative to EPA Method 18 only where: The target compound(s) are known and are listed in ASTM D6420 as measurable; this ASTM should not be used for methane and ethane because their atomic mass is less than 35; ASTM D6420 should never be specified as a total VOC method; (c) you must conduct testing of emissions from continuous cellulose ether process vents and combinations of batch and continuous cellulose ether process vents at normal operating conditions, as specified in § 63.5535; (d) you must conduct testing of emissions from batch cellulose ether process vents as specified in § 63.490(c), except that the emission reductions required for process vents under this subpart supersede the emission reductions required for process vents under subpart U of this part; and (e) you must collect CPMS data during the period of the initial performance test and determine the CPMS operating limit during the period of the initial performance test.

For . . .	at . . .	you must . . .	using . . .	according to the following requirements . . .
			(3) ASTM D6348–12e1.	(a) you must conduct testing of emissions at the inlet and outlet of each control device; (b) you may use ASTM D6348–12e1 as an alternative to EPA Method 320 only where the following conditions are met: (1) The test plan preparation and implementation in the Annexes to ASTM D 6348–03, Sections A1 through A8 are mandatory; and (2) in ASTM D6348–03 Annex A5 (Analyte Spiking Technique), the percent recovery (%R) must be determined for each target analyte (Equation A5.5). In order for the test data to be acceptable for a compound, %R must be greater than or equal to 70 percent and less than or equal to 130 percent. If the %R value does not meet this criterion for a target compound, the test data are not acceptable for that compound and the test must be repeated for that analyte (*i.e.,* the sampling and/or analytical procedure should be adjusted before a retest). The %R value for each compound must be reported in the test report, and all field measurements must be corrected with the calculated %R value for that compound by using the following equation: Reported Results = ((Measured Concentration in the Stack)/(%R)) × 100. (c) you must conduct testing of emissions from continuous solvent coating process vents and combinations of batch and continuous solvent coating process vents at normal operating conditions, as specified in § 63.5535; (d) you must conduct testing of emissions from batch solvent coating process vents as specified in § 63.490(c), except that the emission reductions required for process vents under this subpart supersede the emission reductions required for process vents under subpart U of this part; and (e) you must collect CPMS data during the period of the initial compliance demonstration and determine the CPMS operating limit during the period of the initial compliance demonstration.
			(4) EPA Method 25 in appendix A–7 to part 60 of this chapter; or	(a) you must conduct testing of emissions at the inlet and outlet of each control device; (b) you may use EPA Method 25 to determine the control efficiency of combustion devices for organic compounds; you may not use EPA Method 25 to determine the control efficiency of noncombustion control devices; (c) you must conduct testing of emissions from continuous cellulose ether process vents and combinations of batch and continuous cellulose ether process vents at normal operating conditions, as specified in § 63.5535; (d) you must conduct testing of emissions from batch cellulose ether process vents as specified in § 63.490(c), except that the emission reductions required for process vents under this subpart supersede the emission reductions required for process vents under subpart U of this part; and (e) you must collect CPMS data during the period of the initial performance test and determine the CPMS operating limit during the period of the initial performance test

For . . .	at . . .	you must . . .	using . . .	according to the following requirements . . .
			(5) EPA Method 25A in appendix A–7 to part 60 of this chapter.	(a) you must conduct testing of emissions at the inlet and outlet of each control device; (b) you may use EPA Method 25A if: An exhaust gas volatile organic matter concentration of 50 ppmv or less is required in order to comply with the emission limit; the volatile organic matter concentration at the inlet to the control device and the required level of control are such as to result in exhaust volatile organic matter concentrations of 50 ppmv or less; or because of the high control efficiency of the control device, the anticipated volatile organic matter concentration at the control device exhaust is 50 ppmv or less, regardless of the inlet concentration; (c) you must conduct testing of emissions from continuous cellulose ether process vents and combinations of batch and continuous cellulose ether process vents at normal operating conditions, as specified in § 63.5535; (d) you must conduct testing of emissions from batch cellulose ether process vents as specified in § 63.490(c), except that the emission reductions required for process vents under this subpart supersede the emission reductions required for process vents under subpart U of this part; and, (e) you must collect CPMS data during the period of the initial performance test and determine the CPMS operating limit during the period of the initial performance test.
5. each toluene storage vessel.	a. each existing or new cellophane operation.	i. measure toluene emissions.	(1) EPA Method 18 in appendix A–6 to part 60 of this chapter or Method 320 in appendix A to this part; or	(a) if venting to a control device to reduce emissions, you must conduct testing of emissions at the inlet and outlet of each control device; (b) you may use EPA Method 18 or 320 to determine the control efficiency of any control device for organic compounds; for a combustion device, you must use only HAP that are present in the inlet to the control device to characterize the percent reduction across the combustion device; (c) you must conduct testing of emissions from continuous storage vessel vents and combinations of batch and continuous storage vessel vents at normal operating conditions, as specified in § 63.5535 for continuous process vents; (d) you must conduct testing of emissions from batch storage vessel vents as specified in § 63.490(c) for batch process vents, except that the emission reductions required for process vents under this subpart supersede the emission reductions required for process vents under subpart U of this part; and, (e) you must collect CPMS data during the period of the initial compliance demonstration and determine the CPMS operating limit during the period of the initial compliance demonstration.

For . . .	at . . .	you must . . .	using . . .	according to the following requirements . . .
			(2) ASTM D6420–99; or	(a) if venting to a control device to reduce emissions, you must conduct testing of emissions at the inlet and outlet of each control device; (b) you may use ASTM D6420–99 (Reapproved 2010) as an alternative to EPA Method 18 only where: The target compound(s) are known and are listed in ASTM D6420 as measurable; this ASTM should not be used for methane and ethane because their atomic mass is less than 35; ASTM D6420 should never be specified as a total VOC method; (c) you must conduct testing of emissions from continuous storage vessel vents and combinations of batch and continuous storage vessel vents at normal operating conditions, as specified in § 63.5535 for continuous process vents; (d) you must conduct testing of emissions from batch storage vessel vents as specified in § 63.490(c) for batch process vents, except that the emission reductions required for process vents under this subpart supersede the emission reductions required for process vents under subpart U of this part; and, (e) you must collect CPMS data during the period of the initial compliance demonstration and determine the CPMS operating limit during the period of the initial compliance demonstration.

For . . .	at . . .	you must . . .	using . . .	according to the following requirements . . .
			(3) ASTM D6348–12e1.	(a) you must conduct testing of emissions at the inlet and outlet of each control device; (b) you may use ASTM D6348–12e1 as an alternative to EPA Method 320 only where the following conditions are met: (1) The test plan preparation and implementation in the Annexes to ASTM D 6348–03, Sections A1 through A8 are mandatory; and (2) in ASTM D6348–03 Annex A5 (Analyte Spiking Technique), the percent recovery (%R) must be determined for each target analyte (Equation A5.5). In order for the test data to be acceptable for a compound, %R must be greater than or equal to 70 percent and less than or equal to 130 percent. If the %R value does not meet this criterion for a target compound, the test data are not acceptable for that compound and the test must be repeated for that analyte (*i.e.,* the sampling and/or analytical procedure should be adjusted before a retest). The %R value for each compound must be reported in the test report, and all field measurements must be corrected with the calculated %R value for that compound by using the following equation: Reported Results = ((Measured Concentration in the Stack)/(%R)) × 100. (c) you must conduct testing of emissions from continuous solvent coating process vents and combinations of batch and continuous solvent coating process vents at normal operating conditions, as specified in § 63.5535; (d) you must conduct testing of emissions from batch solvent coating process vents as specified in § 63.490(c), except that the emission reductions required for process vents under this subpart supersede the emission reductions required for process vents under subpart U of this part; and (e) you must collect CPMS data during the period of the initial compliance demonstration and determine the CPMS operating limit during the period of the initial compliance demonstration.
6. the sum of all process vents controlled using a flare.	each existing or new affected source.	measure visible emissions.	EPA Method 22 in appendix A–7 to part 60 of this chapter.	you must conduct the flare visible emissions test according to § 63.11(b).
7. equipment leaks	a. each existing or new cellulose ether operation.	i. measure leak rate.	(1) applicable equipment leak test methods in § 63.180; or	you must follow all requirements for the applicable equipment leak test methods in § 63.180; or
			(2) applicable equipment leak test methods in § 63.1023.	you must follow all requirements for the applicable equipment leak test methods in § 63.1023.
8. all sources of wastewater emissions.	a. each existing or new cellulose ether operation.	i. measure wastewater HAP emissions.	(1) applicable wastewater test methods and procedures in §§ 63.144 and 63.145; or	(a) You must follow all requirements for the applicable wastewater test methods and procedures in §§ 63.144 and 63.145; or

For . . .	at . . .	you must . . .	using . . .	according to the following requirements . . .
			(2) applicable wastewater test methods and procedures in §§ 63.144 and 63.145, using ASTM D5790–95 (Reapproved 2012) (incorporated by reference—see § 63.14) as an alternative to EPA Method 624 in appendix A to part 163 of this chapter.	(a) you must follow all requirements for the applicable waste water test methods and procedures in §§ 63.144 and 63.145, except that you may use ASTM D5790–95 (Reapproved 2012) as an alternative to EPA Method 624, under the condition that this ASTM method be used with the sampling procedures of EPA Method 25D or an equivalent method.
9. any emission point	a. each existing or new affected source using a CEMS to demonstrate compliance.	i. conduct a CEMS performance evaluation.	(1) applicable requirements in § 63.8 and applicable performance specification (PS–7, PS–8, PS–9, or PS–15) in appendix B to part 60 of this chapter.	(a) you must conduct the CEMS performance evaluation during the period of the initial compliance demonstration according to the applicable requirements in § 63.8 and the applicable performance specification (PS–7, PS–8, PS–9, or PS–15) of 40 CFR part 60, appendix B; (b) you must install, operate, and maintain the CEMS according to the applicable performance specification (PS–7, PS–8, PS–9, or PS–15) of 40 CFR part 60, appendix B; and (c) you must collect CEMS emissions data at the inlet and outlet of each control device during the period of the initial compliance demonstration and determine the CEMS operating limit during the period of the initial compliance demonstration.

■ 15. Table 5 to Subpart UUUU is revised to read as follows:

Table 5 to Subpart UUUU of Part 63—Continuous Compliance With Emission Limits and Work Practice Standards

As required in § 63.5555(a), you must demonstrate continuous compliance with the appropriate emission limits and work practice standards according to the requirements in the following table:

For . . .	at . . .	for the following emission limit or work practice standard . . .	you must demonstrate continuous compliance by . . .
1. the sum of all viscose process vents.	a. each existing or new viscose process affected source.	i. reduce total uncontrolled sulfide emissions (reported as carbon disulfide) by at least the specified percentage based on a 6-month rolling average; ii. for each vent stream that you control using a control device (except for retractable hoods over sulfuric acid baths at a cellophane operation), route the vent stream through a closed-vent system to the control device; and iii. comply with the work practice standard for closed-vent systems (except for retractable hoods over sulfuric acid baths at a cellophane operation)	(1) maintaining a material balance that includes the pertinent data used to determine the percent reduction of total sulfide emissions; (2) documenting the percent reduction of total sulfide emissions using the pertinent data from the material balance; and (3) complying with the continuous compliance requirements for closed-vent systems.
2. the sum of all solvent coating process vents.	a. each existing or new cellophane operation.	i. reduce uncontrolled toluene emissions by at least 95 percent based on a 6-month rolling average; ii. for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and iii. comply with the work practice standard for closed-vent systems.	(1) maintaining a material balance that includes the pertinent data used to determine the percent reduction of toluene emissions; (2) documenting the percent reduction of toluene emissions using the pertinent data from the material balance; and (3) complying with the continuous compliance requirements for closed-vent systems.

For . . .	at . . .	for the following emission limit or work practice standard . . .	you must demonstrate continuous compliance by . . .
3. the sum of all cellulose ether process vents.	a. each existing or new cellulose ether operation using a performance test to demonstrate initial compliance; or.	i. reduce total uncontrolled organic HAP emissions by at least 99 percent; ii. for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and, iii. comply with the work practice standard for closed-vent systems; or	(1) complying with the continuous compliance requirements for closed-vent systems; or (2) if using extended cookout to comply, monitoring reactor charges and keeping records to show that extended cookout was employed.
	b. each existing or new cellulose ether operation using a material balance compliance demonstration to demonstrate initial compliance.	i. reduce total uncontrolled organic HAP emissions by at least 99 percent based on a 6-month rolling average; ii. for each vent stream that you control using a control device, route the vent stream through a closed-vent system to control device; and iii. comply with the work practice standard for closed-vent systems.	(1) maintaining a material balance that includes the pertinent data used to determine the percent reduction of total organic HAP emissions; (2) documenting the percent reduction of total organic HAP emissions using the pertinent data from the material balance; (3) if using extended cookout to comply, monitoring reactor charges and keeping records to show that extended cookout was employed; (4) complying with the continuous compliance requirements for closed-vent systems.
4. closed-loop systems	each existing or new cellulose ether operation.	operate and maintain a closed-loop system.	keeping a record certifying that a closed-loop system is in use for cellulose ether operations.
5. each carbon disulfide unloading and storage operation.	a. each existing or new viscose process affected source.	i. reduce uncontrolled carbon disulfide emissions by at least 83 percent based on a 6-month rolling average if you use an alternative control technique not listed in this table for carbon disulfide unloading and storage operations; if using a control device to reduce emissions, route emissions through a closed-vent system to the control device; and comply with the work practice standard for closed-vent systems;	(1) keeping a record documenting the 83 percent reduction in carbon disulfide emissions; and (2) if venting to a control device to reduce emissions, complying with the continuous compliance requirements for closed-vent systems;
	.....	ii. reduce total uncontrolled sulfide emissions by at least 0.14 percent from viscose process vents based on a 6-month rolling average; for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and comply with the work practice standard for closed-vent systems;	(1) maintaining a material balance that includes the pertinent data used to determine the percent reduction of total sulfide emissions; (2) documenting the percent reduction of total sulfide emissions using the pertinent data from the material balance; and (3) complying with the continuous compliance requirements for closed-vent systems;
	.....	iii. install a nitrogen unloading and storage system; or	Keeping a record certifying that a nitrogen unloading and storage system is in use; or
	.....	iv. install a nitrogen unloading system; reduce total uncontrolled sulfide emissions by at least 0.045 percent from viscose process vents based on a 6-month rolling average; for each vent stream that you control using a control device, route the vent stream through a closed-vent system to the control device; and comply with the work practice standard for closed-vent systems.	(1) keeping a record certifying that a nitrogen unloading system is in use; (2) maintaining a material balance that includes the pertinent data used to determine the percent reduction of total sulfide emissions; (3) documenting the percent reduction of total sulfide emissions using the pertinent data from the material balance; and (4) complying with the continuous compliance requirements for closed-vent systems.
6. each toluene storage vessel.	a. each existing or new cellophane operation.	i. reduce uncontrolled toluene emissions by at least 95 percent based on a 6-month rolling average; ii. if using a control device to reduce emissions, route the emissions through a closed-vent system to the control device; and iii. comply with the work practice standard for closed vent systems.	(1) maintaining a material balance that includes the pertinent data used to determine the percent reduction of toluene emissions; (2) documenting the percent reduction of toluene emissions using the pertinent data from the material balance; and (3) if venting to a control device to reduce emissions, complying with the continuous compliance requirements for closed-vent systems.
7. equipment leaks	a. each existing or new cellulose ether operation.	i. applicable equipment leak standards of §§ 63.162 through 63.179; or ii. applicable equipment leak standards of §§ 63.1021 through 63.1037.	complying with the applicable equipment leak continuous compliance provisions of §§ 63.162 through 63.179; or complying with the applicable equipment leak continuous compliance provisions of §§ 63.1021 through 63.1037.

For . . .	at . . .	for the following emission limit or work practice standard . . .	you must demonstrate continuous compliance by . . .
8. all sources of wastewater emissions.	each existing or new cellulose either operation.	applicable wastewater provisions of § 63.105 and §§ 63.132 through 63.140.	complying with the applicable wastewater continuous compliance provisions of §§ 63.105, 63.143, and 63.148.
9. liquid streams in open systems.	each existing or new cellulose ether operation.	comply with the applicable provisions of § 63.149, except that references to ''chemical manufacturing process unit'' mean ''cellulose ether process unit'' for the purposes of this subpart.	conducting inspections, repairing failures, documenting delay of repair, and maintaining records of failures and corrective actions according to §§ 63.133 through 63.137.
10. closed-vent system used to route emissions to a control device.	each existing or new affected source.	conduct annual inspections, repair leaks, maintain records as specified in § 63.148.	conducting the inspections, repairing leaks, and maintaining records according to § 63.148.
11. closed-vent system containing a bypass line that could divert a vent stream away from a control device, except for equipment needed for safety purposes (described in § 63.148(f)(3).	a. each existing or new affected source.	i. install, calibrate, maintain, and operate a flow indicator as specified in § 63.148(f)(1); or	(1) taking readings from the flow indicator at least once every 15 minutes; (2) maintaining hourly records of flow indicator operation and detection of any diversion during the hour, and (3) recording all periods when the vent stream is diverted from the control stream or the flow indicator is not operating; or
		ii. secure the bypass line valve in the closed position with a car-seal or lock-and-key type configuration and inspect the seal or mechanism at least once per month as specified in § 63.148(f)(2).	(1) maintaining a record of the monthly visual inspection of the seal or closure mechanism for the bypass line; and (2) recording all periods when the seal mechanism is broken, the bypass line valve position has changed, or the key for a lock-and-key type lock has been checked out.
12. heat exchanger system that cools process equipment or materials in the process unit.	a. each existing or new affected source.	i. monitor and repair the heat exchanger system according to § 63.104(a) through (e), except that references to ''chemical manufacturing process unit'' mean ''cellulose food casing, rayon, cellulosic sponge, cellophane, or cellulose ether process unit'' for the purposes of this subpart.	(1) monitoring for HAP compounds, other substances, or surrogate indicators at the frequency specified in § 63.104(b) or (c); (2) repairing leaks within the time period specified in § 63.104(d)(1); (3) confirming that the repair is successful as specified in § 63.104(d)(2); (4) following the procedures in § 63.104(e) if you implement delay of repair; and (5) recording the results of inspections and repair according to § 63.104(f)(1).

■ 16. Table 6 to Subpart UUUU is revised to read as follows:

Table 6 to Subpart UUUU of Part 63—Continuous Compliance With Operating Limits

As required in § 63.5555(a), you must demonstrate continuous compliance with the appropriate operating limits according to the requirements in the following table:

For the following control technique . . .	for the following operating limit . . .	you must demonstrate continuous compliance by . . .
1. condenser	maintain the daily average condenser outlet gas or condensed liquid temperature no higher than the value established during the compliance demonstration.	collecting the condenser outlet gas or condensed liquid temperature data according to § 63.5545; reducing the condenser outlet gas temperature data to daily averages; and maintaining the daily average condenser outlet gas or condensed liquid temperature no higher than the value established during the compliance demonstration.
2. thermal oxidizer.	a. for normal operations, maintain the daily average thermal oxidizer firebox temperature no lower than the value established during the compliance demonstration.	collecting the thermal oxidizer firebox temperature data according to § 63.5545; reducing the thermal oxidizer firebox temperature data to daily averages; and maintaining the daily average thermal oxidizer firebox temperature no lower than the value established during the compliance demonstration.
	b. for periods of startup, maintain documentation demonstrating that the oxidizer was properly operating (*e.g.,* firebox temperature had reached the setpoint temperature) prior to emission unit startup..	collecting the appropriate, site-specific data needed to demonstrate that the oxidizer was properly operating prior to emission unit start up; and excluding firebox temperature from the daily averages during emission unit startup.

For the following control technique . . .	for the following operating limit . . .	you must demonstrate continuous compliance by . . .
3. water scrubber.	a. for periods of normal operation, maintain the daily average scrubber pressure drop and scrubber liquid flow rate within the range of values established during the compliance demonstration.	collecting the scrubber pressure drop and scrubber liquid flow rate data according to § 63.5545; reducing the scrubber parameter data to daily averages; and maintaining the daily scrubber parameter values within the range of values established during the compliance demonstration.
	b. for periods of startup and shutdown, maintain documentation to confirm that the scrubber is operating properly prior to emission unit startup and continues to operate properly until emission unit shutdown is complete. Appropriate startup and shutdown operating parameters may be based on equipment design, manufacturer's recommendations, or other site-specific operating values established for normal operating periods..	collecting the appropriate, site-specific data needed to demonstrate that the scrubber was operating properly during emission unit startup and emission unit shutdown; and excluding parameters from the daily average calculations.
4. caustic scrubber.	a. for periods of normal operation, maintain the daily average scrubber pressure drop, scrubber liquid flow rate, and scrubber liquid pH, conductivity, or alkalinity within the range of values established during the compliance demonstration.	collecting the scrubber pressure drop, scrubber liquid flow rate, and scrubber liquid pH, conductivity, or alkalinity data according to § 63.5545; reducing the scrubber parameter data to daily averages; and maintaining the daily scrubber parameter values within the range of values established during the compliance demonstration.
	b. for periods of startup and shutdown, maintain documentation to confirm that the scrubber is operating properly prior to emission unit startup and continues to operate properly until emission unit shutdown is complete. Appropriate startup and shutdown operating parameters may be based on equipment design, manufacturer's recommendations, or other site-specific operating values established for normal operating periods..	collecting the appropriate, site-specific data needed to demonstrate that the scrubber was operating properly during emission unit startup and emission unit shutdown; and excluding parameters from the daily average calculations.
5. flare	maintain the presence of a pilot flame	collecting the pilot flame data according to § 63.5545; and maintaining the presence of the pilot flame.
6. biofilter	maintain the daily average biofilter inlet gas temperature, biofilter effluent pH or conductivity, and pressure drop within the values established during the compliance demonstration.	collecting the biofilter inlet gas temperature, biofilter effluent pH or conductivity, and biofilter pressure drop data according to § 63.5545; reducing the biofilter parameter data to daily averages; and maintaining the daily biofilter parameter values within the values established during the compliance demonstration.
7. carbon absorber.	maintain the regeneration frequency, total regeneration stream mass or volumetric flow during carbon bed regeneration and temperature of the carbon bed after regeneration (and within 15 minutes of completing any cooling cycle(s)) for each regeneration cycle within the values established during the compliance demonstration.	collecting the data on regeneration frequency, total regeneration stream mass or volumetric flow during carbon bed regeneration and temperature of the carbon bed after regeneration (and within 15 minutes of completing any cooling cycle(s)) for each regeneration cycle according to § 63.5545; and maintaining carbon absorber parameter values for each regeneration cycle within the values established during the compliance demonstration.
8. oil absorber ..	maintain the daily average absorption liquid flow, absorption liquid temperature, and steam flow within the values established during the compliance demonstration.	collecting the absorption liquid flow, absorption liquid temperature, and steam flow data according to § 63.5545; reducing the oil absorber parameter data to daily averages; and maintaining the daily oil absorber parameter values within the values established during the compliance demonstration.
9. any of the control techniques specified in this table.	if using a CEMS, maintain the daily average control efficiency for each control device no lower than the value established during the compliance demonstration.	collecting CEMS emissions data at the inlet and outlet of each control device according to § 63.5545; determining the control efficiency values for each control device using the inlet and outlet CEMS emissions data; reducing the control efficiency values for each control device to daily averages; and maintaining the daily average control efficiency for each control device no lower than the value established during the compliance demonstration.

■ 17. Table 7 to Subpart UUUU is revised to read as follows:

Table 7 to Subpart UUUU of Part 63—Notifications

As required in §§ 63.5490(c)(4), 63.5530(c), 63.5575, and 63.5595(b), you must submit the appropriate notifications specified in the following table:

If you . . .	then you must . . .
1. are required to conduct a performance test	submit a notification of intent to conduct a performance test at least 60 calendar days before the performance test is scheduled to begin, as specified in §§ 63.7(b)(1) and 63.9(e).

If you . . .	then you must . . .
2. are required to conduct a CMS performance evaluation	submit a notification of intent to conduct a CMS performance evaluation at least 60 calendar days before the CMS performance evaluation is scheduled to begin, as specified in §§ 63.8(e)(2) and 63.9(g).
3. wish to use an alternative monitoring method	submit a request to use alternative monitoring method no later than the notification of the initial performance test or CMS performance evaluation or 60 days prior to any other initial compliance demonstration, as specified in § 63.8(f)(4).
4. start up your affected source before June 11, 2002	submit an initial notification no later than 120 days after June 11, 2002, as specified in § 63.9(b)(2).
5. start up your new or reconstructed source on or after June 11, 2002	submit an initial notification no later than 120 days after you become subject to this subpart, as specified in § 63.9(b)(3).
6. cannot comply with the relevant standard by the applicable compliance date.	submit a request for extension of compliance no later than 120 days before the compliance date, as specified in §§ 63.9(c) and 63.6(i)(4).
7. are subject to special requirements as specified in § 63.6(b)(3) and (4).	notify the Administrator of your compliance obligations no later than the initial notification dates established in § 63.9(b) for new sources not subject to the special provisions, as specified in § 63.9(d).
8. are required to conduct visible emission observations to determine the compliance of flares as specified in § 63.11(b)(4).	notify the Administrator of the anticipated date for conducting the observations specified in § 63.6(h)(5), as specified in §§ 63.6(h)(4) and 63.9(f).
9. are required to conduct a performance test or other initial compliance demonstration as specified in Table 3 to this subpart.	a. submit a Notification of Compliance Status Report, as specified in § 63.9(h); b. submit the Notification of Compliance Status Report, including the performance test, CEMS performance evaluation, and any other initial compliance demonstration results within 240 calendar days following the compliance date specified in § 63.5495; and c. for sources which construction or reconstruction commenced on or before September 9, 2019, beginning on December 29, 2020, submit all subsequent Notifications of Compliance Status following the procedure specified in § 63.5580(g), (j), and (k). For sources which construction or reconstruction commenced after September 9, 2019, on July 2, 2020, or immediately upon startup, whichever is later, submit all subsequent Notifications of Compliance Status following the procedure specified in § 63.5580(g), (j), and (k).
10. comply with the equipment leak requirements of subpart H of this part for existing or new cellulose ether affected sources.	comply with the notification requirements specified in § 63.182(a)(1) and (2), (b), and (c)(1) through (3) for equipment leaks, with the Notification of Compliance Status Reports required in subpart H included in the Notification of Compliance Status Report required in this subpart.
11. comply with the equipment leak requirements of subpart UU of this part for existing or new cellulose ether affected sources.	comply with the notification requirements specified in § 63.1039(a) for equipment leaks, with the Notification Compliance Status Reports required in subpart UU of this part included in the Notification of Compliance Status Report required in this subpart.
12. comply with the wastewater requirements of subparts F and G of this part for existing or new cellulose ether affected sources.	comply with the notification requirements specified in §§ 63.146(a) and (b), 63.151, and 63.152(a)(1) through (3) and (b)(1) through (5) for wastewater, with the Notification of Compliance Status Reports required in subpart G of this part included in the Notification of Compliance Status Report required in this subpart.

■ 18. Table 8 to Subpart UUUU is revised to read as follows:

Table 8 to Subpart UUUU of Part 63—Reporting Requirements

As required in § 63.5580, you must submit the appropriate reports specified in the following table:

You must submit a compliance report, which must contain the following information . . .	and you must submit the report . . .
1. if there are no deviations from any emission limit, operating limit, or work practice standard during the reporting period, then the report must contain the information specified in § 63.5580(c); 2. if there were no periods during which the CMS was out-of-control, then the report must contain the information specified in § 63.5580(c)(6); 3. if there is a deviation from any emission limit, operating limit, or work practice standard during the reporting period, then the report must contain the information specified in § 63.5580(c) and (d); 4. if there were periods during which the CMS was out-of-control, then the report must contain the information specified in § 63.5580(e);	semiannually as specified in § 63.5580(b); beginning on December 29, 2020, submit all subsequent reports following the procedure specified in § 63.5580(g).

You must submit a compliance report, which must contain the following information . . .	and you must submit the report . . .
5. for sources which commenced construction or reconstruction on or before September 9, 2019, if prior to December 29, 2020, you had a startup, shutdown, or malfunction during the reporting period and you took actions consistent with your SSM plan, then the report must contain the information specified in § 63.10(d)(5)(i); 6. for sources which commenced construction or reconstruction on or before September 9, 2019, if prior to December 29, 2020, you had a startup, shutdown, or malfunction during the reporting period and you took actions that are not consistent with your SSM plan, then the report must contain the information specified in § 63.10(d)(5)(ii); 7. the report must contain any change in information already provided, as specified in § 63.9(j); 8. for cellulose ether affected sources complying with the equipment leak requirements of subpart H of this part, the report must contain the information specified in § 63.182(a)(3) and (6) and (d)(2) through (4); 9. for cellulose ether affected sources complying with the equipment leak requirements of subpart UU of this part, the report must contain the information specified in § 63.1039(b); 10. for cellulose ether affected sources complying with the wastewater requirements of subparts F and G of this part, the report must contain the information specified in §§ 63.146(c) through (e) and 63.152(a)(4) and (5) and (c) through (e); 11. for affected sources complying with the closed-vent system provisions in § 63.148, the report must contain the information specified in § 63.148(j)(1); 12. for affected sources complying with the bypass line provisions in § 63.148(f), the report must contain the information specified in § 63.148(j)(2) and (3); 13. for affected sources invoking the delay of repair provisions in § 63.104(e) for heat exchanger systems, the next compliance report must contain the information in § 63.104(f)(2)(i) through (iv); if the leak remains unrepaired, the information must also be submitted in each subsequent compliance report until the repair of the leak is reported; and 14. for storage vessels subject to the emission limits and work practice standards in Table 1 to Subpart UUUU, the report must contain the periods of planned routine maintenance during which the control device does not comply with the emission limits or work practice standards in Table 1 to this subpart.	

■ 19. Table 9 to Subpart UUUU is revised to read as follows:

Table 9 to Subpart UUUU of Part 63—Recordkeeping Requirements

As required in § 63.5585, you must keep the appropriate records specified in the following table:

If you operate . . .	then you must keep . . .	and the record(s) must contain . . .
1. an existing or new affected source.	a copy of each notification and report that you submitted to comply with this subpart.	all documentation supporting any Initial Notification or Notification of Compliance Status Report that you submitted, according to the requirements in § 63.10(b)(2)(xiv), and any compliance report required under this subpart.
2. an existing or new affected source that commenced construction or reconstruction on or before September 9, 2019.	a. the records in § 63.6(e)(3)(iii) through (iv) related to startup, shutdown, and malfunction prior to December 30, 2020.	i. SSM plan; ii. when actions taken during a startup, shutdown, or malfunction are consistent with the procedures specified in the SSM plan, records demonstrating that the procedures specified in the plan were followed; iii. records of the occurrence and duration of each startup, shutdown, or malfunction; and iv. when actions taken during a startup, shutdown, or malfunction are not consistent with the procedures specified in the SSM plan, records of the actions taken for that event.

If you operate . . .	then you must keep . . .	and the record(s) must contain . . .
	b. records related to startup and shutdown, failures to meet the standard, and actions taken to minimize emissions after December 29, 2020.	i. record the date, time, and duration of each startup and/or shutdown period, including the periods when the affected source was subject to the alternative operating parameters applicable to startup and shutdown; ii. in the event that an affected unit fails to meet an applicable standard, record the number of failures. For each failure, record the date, time and duration of each failure; iii. for each failure to meet an applicable standard, record and retain a list of the affected sources or equipment, an estimate of the quantity of each regulated pollutant emitted over any emission limit and a description of the method used to estimate the emissions; and iv. record actions taken to minimize emissions in accordance with § 63.5515(b), and any corrective actions taken to return the affected unit to its normal or usual manner of operation.
3. a new or reconstructed affected source that commenced construction or reconstruction after September 9, 2019.	a. records related to startup and shutdown, failures to meet the standard, and actions taken to minimize emissions.	i. record the date, time, and duration of each startup and/or shutdown period, including the periods when the affected source was subject to alternative operating parameters applicable to startup and shutdown; ii. in the event that an affected unit fails to meet an applicable standard, record the number of failures. For each failure, record the date, time and duration of each failure; iii. for each failure to meet an applicable standard, record and retain a list of the affected sources or equipment, an estimate of the quantity of each regulated pollutant emitted over any emission limit and a description of the method used to estimate the emissions; and iv. record actions taken to minimize emissions in accordance with § 63.5515(b), and any corrective actions taken to return the affected unit to its normal or usual manner of operation.
4. an existing or new affected source.	a. a site-specific monitoring plan ...	i. information regarding the installation of the CMS sampling source probe or other interface at a measurement location relative to each affected process unit such that the measurement is representative of control of the exhaust emissions (*e.g.,* on or downstream of the last control device); ii. performance and equipment specifications for the sample interface, the pollutant concentration or parametric signal analyzer, and the data collection and reduction system; iii. performance evaluation procedures and acceptance criteria (*e.g.,* calibrations); iv. ongoing operation and maintenance procedures in accordance with the general requirements of §§ 63.8(c)(3) and (4)(ii), 63.5515(b), and 63.5580(c)(6); v. ongoing data quality assurance procedures in accordance with the general requirements of § 63.8(d)(2); and vi. ongoing recordkeeping and reporting procedures in accordance with the general requirements of §§ 63.10(c)(1)–(6), (c)(9)–(14), (e)(1), and (e)(2)(i) and 63.5585.
5. an existing or new affected source.	records of performance tests and CEMS performance evaluations, as required in § 63.10(b)(2)(viii) and any other initial compliance demonstrations.	all results of performance tests, CEMS performance evaluations, and any other initial compliance demonstrations, including analysis of samples, determination of emissions, and raw data.
6. an existing or new affected source.	a. records for each CEMS	i. records described in § 63.10(b)(2)(vi) through (xi); ii. previous (superseded) versions of the performance evaluation plan, with the program of corrective action included in the plan required under § 63.8(d)(2); iii. request for alternatives to relative accuracy test for CEMS as required in § 63.8(f)(6)(i); iv. records of the date and time that each deviation started and stopped, and whether the deviation occurred during a period of startup, shutdown, or malfunction or during another period; and v. records required in Table 6 to Subpart UUUU to show continuous compliance with the operating limit.
7. an existing or new affected source.	a. records for each CPMS	i. records required in Table 6 to Subpart UUUU to show continuous compliance with each operating limit that applies to you; and ii. results of each CPMS calibration, validation check, and inspection required by § 63.5545(b)(4).
8. an existing or new cellulose ether affected ether source.	records of closed-loop systems	records certifying that a closed-loop system is in use for cellulose ether operations.
9. an existing or new viscose process affected source.	records of nitrogen unloading and storage systems or nitrogen unloading systems.	records certifying that a nitrogen unloading and storage systems or nitrogen unloading system is in use.

If you operate . . .	then you must keep . . .	and the record(s) must contain . . .
10. an existing or new viscose process affected source.	records of material balances	all pertinent data from the material balances used to estimate the 6-month rolling average percent reduction in HAP emissions.
11. an existing or new viscose process affected source.	records of calculations	documenting the percent reduction in HAP emissions using pertinent data from the material balances.
12. an existing or new cellulose ether affected source.	a. extended cookout records	i. the amount of HAP charged to the reactor; ii. the grade of product produced; iii. the calculated amount of HAP remaining before extended cookout; and iv. information showing that extended cookout was employed.
13. an existing or new cellulose ether affected source.	a. equipment leak records	i. the records specified in § 63.181 for equipment leaks; or ii. the records specified in 63.1038 for equipment leaks.
14. an existing or new cellulose ether affected source.	wastewater records	the records specified in §§ 63.105, 63.147, and 63.152(f) and (g) for wastewater.
15. an existing or new affected source.	closed-vent system records	the records specified in § 63.148(i).
16. an existing or new affected source.	a. bypass line records	i. hourly records of flow indicator operation and detection of any diversion during the hour and records of all periods when the vent stream is diverted from the control stream or the flow indicator is not operating; or ii. the records of the monthly visual inspection of the seal or closure mechanism and of all periods when the seal mechanism is broken, the bypass line valve position has changed, or the key for a lock-and-key type lock has been checked out and records of any car-seal that has broken.
17. an existing or new affected source.	heat exchanger system records	records of the results of inspections and repair according to source § 63.104(f)(1).
18. an existing or new affected source.	control device maintenance records.	records of planned routine maintenance for control devices used to comply with the percent reduction emission limit for storage vessels in Table 1 to Subpart UUUU.
19. an existing or new affected source.	safety device records	a record of each time a safety device is opened to avoid unsafe conditions according to § 63.5505(d).

■ 20. Table 10 to Subpart UUUU is revised to read as follows:

Table 10 to Subpart UUUU of Part 63—Applicability of General Provisions to Subpart UUUU

As required in §§ 63.5515(h) and 63.5600, you must comply with the appropriate General Provisions requirements specified in the following table:

Citation	Subject	Brief description	Applies to Subpart UUUU
§ 63.1	Applicability	Initial applicability determination; applicability after standard established; permit requirements; extensions, notifications.	Yes.
§ 63.2	Definitions	Definitions for part 63 standards	Yes.
§ 63.3	Units and Abbreviations.	Units and abbreviations for part 63 standards	Yes.
§ 63.4	Prohibited Activities and Circumvention.	Prohibited activities; compliance date; circumvention, severability.	Yes.
§ 63.5	Preconstruction Review and Notification Requirements.	Preconstruction review requirements of section 112(i)(1).	Yes.
§ 63.6(a)	Applicability	General provisions apply unless compliance extension; general provisions apply to area sources that become major.	Yes.
§ 63.6(b)(1) through (4)	Compliance Dates for New and Reconstructed sources.	Standards apply at effective date; 3 years after effective date; upon startup; 10 years after construction or reconstruction commences for CAA section 112(f).	Yes.
§ 63.6(b)(5)	Notification	Must notify if commenced construction or reconstruction after proposal.	Yes.
§ 63.6(b)(6)	[Reserved].		
§ 63.6(b)(7)	Compliance Dates for New and Reconstructed Area Sources That Become Major.	Area sources that become major must comply with major source and standards immediately upon becoming major, regardless of whether required to comply when they were an area source.	Yes.

Citation	Subject	Brief description	Applies to Subpart UUUU
§ 63.6(c)(1) and (2)	Compliance Dates for Existing Sources.	Comply according to date in subpart, which must be no later than 3 years after effective date; for CAA section 112(f) standards, comply within 90 days of effective date unless compliance extension.	Yes.
§ 63.6(c)(3) and (4)	[Reserved].		
§ 63.6(c)(5)	Compliance Dates for Existing Area Sources That Become Major.	Area sources that become major must comply with major source standards by date indicated in subpart or by equivalent time period (*e.g.,* 3 years).	Yes.
§ 63.6(d)	[Reserved]		
§ 63.6(e)(1)(i)	General Duty to Minimize Emissions.	You must operate and maintain affected source in a manner consistent with safety and good air pollution control practices for minimizing emissions.	No, for new or reconstructed sources which commenced construction or reconstruction after September 9, 2019. For all other affected sources, Yes before December 30, 2020, and No thereafter. See 40 CFR 63.5515(b) for general duty requirement.
§ 63.6(e)(1)(ii)	Requirement to Correct Malfunctions ASAP.	You must correct malfunctions as soon as practicable after their occurrence.	No, for new or reconstructed sources which commenced construction or reconstruction after September 9, 2019. For all other affected sources, Yes before December 30, 2020, and No thereafter.
§ 63.6(e)(1)(iii)	Operation and Maintenance Requirements.	Operation and maintenance requirements are enforceable independent of emissions limitations or other requirements in relevant standards.	Yes.
§ 63.6(e)(2)	[Reserved].		
§ 63.6(e)(3)	SSM Plan	Requirement for SSM and SSM plan; content of SSM plan.	No, for new or reconstructed sources which commenced construction or reconstruction after September 9, 2019. For all other affected sources, Yes before December 30, 2020, and No thereafter. See 40 CFR 63.5515(c).
§ 63.6(f)(1)	SSM Exemption	You must comply with emission standards at all times except during SSM.	No, see 40 CFR 63.5515(a).
§ 63.6(f)(2) and (3)	Methods for Determining Compliance/ Finding of Compliance.	Compliance based on performance test, operation and maintenance plans, records, inspection.	Yes.
§ 63.6(g)(1) through (3)	Alternative Standard	Procedures for getting an alternative standard	Yes.
§ 63.6(h)(1)	SSM Exemption	You must comply with opacity and visible emission standards at all times except during SSM.	No, see CFR 63.5515(a).
§ 63.6(h)(2) through (9)	Opacity and Visible Emission (VE) Standards.	Requirements for opacity and visible emission limits.	Yes, but only for flares for which EPA Method 22 observations are required under § 63.11(b).
§ 63.6(i)(1) through (16)	Compliance Extension	Procedures and criteria for Administrator to grant compliance extension.	Yes.
§ 63.6(j)	Presidential Compliance Exemption.	President may exempt source category from requirement to comply with subpart.	Yes.
§ 63.7(a)(1) and (2)	Performance Test Dates.	Dates for conducting initial performance test; testing and other compliance demonstrations; must conduct 180 days after first subject to subpart.	Yes.
§ 63.7(a)(3)	Section 114 Authority	Administrator may require a performance test under CAA section 114 at any time.	Yes.
§ 63.7(b)(1)	Notification of Performance Test.	Must notify Administrator 60 days before the test.	Yes.
§ 63.7(b)(2)	Notification of Rescheduling.	If rescheduling a performance test is necessary, must notify Administrator 5 days before scheduled date of rescheduled test.	Yes.
§ 63.7(c)	Quality Assurance and Test Plan.	Requirement to submit site-specific test plan 60 days before the test or on date Administrator agrees with; test plan approval procedures; performance audit requirements; internal and external QA procedures for testing.	No.
§ 63.7(d)	Testing Facilities	Requirements for testing facilities	Yes.
§ 63.7(e)(1)	Performance Testing	Performance tests must be conducted under representative conditions; cannot conduct performance tests during SSM; not a violation to exceed standard during SSM.	No, see § 63.5535 and Table 4.

Citation	Subject	Brief description	Applies to Subpart UUUU
§ 63.7(e)(2)	Conditions for Conducting Performance Tests.	Must conduct according to this subpart and EPA test methods unless Administrator approves alternative.	Yes.
§ 63.7(e)(3)	Test Run Duration	Must have three test runs of at least 1 hour each; compliance is based on arithmetic mean of three runs; conditions when data from an additional test run can be used.	Yes.
§ 63.7(f)	Alternative Test Method.	Procedures by which Administrator can grant approval to use an alternative test method.	Yes.
§ 63.7(g)	Performance Test Data Analysis.	Must include raw data in performance test report; must submit performance test data 60 days after end of test with the Notification of Compliance Status Report; keep data for 5 years.	Yes.
§ 63.7(h)	Waiver of Tests	Procedures for Administrator to waive performance test.	Yes.
§ 63.8(a)(1)	Applicability of Monitoring Requirements.	Subject to all monitoring requirements in standard.	Yes.
§ 63.8(a)(2)	Performance Specifications.	Performance specifications in appendix B of 40 CFR part 60 apply.	Yes.
§ 63.8(a)(3)	[Reserved].		
§ 63.8(a)(4)	Monitoring with Flares	Unless your subpart says otherwise, the requirements for flares in § 63.11 apply.	Yes.
§ 63.8(b)(1)	Monitoring	Must conduct monitoring according to standard unless Administrator approves alternative.	Yes.
§ 63.8(b)(2) and (3)	Multiple Effluents and Multiple Monitoring Systems.	Specific requirements for installing monitoring systems; must install on each effluent before it is combined and before it is released to the atmosphere unless Administrator approves otherwise; if more than one monitoring system on an emission point, must report all monitoring system results, unless one monitoring system is a backup.	Yes.
§ 63.8(c)(1) and (c)(1)(i).	General Duty to Minimize Emissions and CMS Operation.	Maintain monitoring system in a manner consistent with good air pollution control practices.	No, for new or reconstructed sources which commenced construction or reconstruction after September 9, 2019. For all other affected sources, Yes before December 30, 2020, and No thereafter. See 40 CFR 63.5515(b).
§ 63.8(c)(1)(ii)	Parts for Routine Repairs.	Keep parts for routine repairs readily available.	Yes.
§ 63.8(c)(1)(iii)	Requirements to develop SSM Plan for CMS.	Develop a written SSM plan for CMS	No, for new or reconstructed sources which commenced construction or reconstruction after September 9, 2019. For all other affected sources, Yes before December 30, 2020, and No thereafter. See 40 CFR 63.5515(c).
§ 63.8(c)(2) and (3)	Monitoring System Installation.	Must install to get representative emission of parameter measurements; must verify operational status before or at performance test.	Yes.
§ 63.8(c)(4)	CMS Requirements	CMS must be operating except during breakdown, out-of control, repair, maintenance, and high-level calibration drifts.	No. Replaced with language in § 63.5560.
§ 63.8(c)(4)(i) and (ii)	CMS Requirements	Continuous opacity monitoring systems (COMS) must have a minimum of one cycle of sampling and analysis for each successive 10-second period and one cycle of data recording for each successive 6-minute period; CEMS must have a minimum of one cycle of operation for each successive 15-minute period.	Yes, except that § 63.8(c)(4)(i) does not apply because subpart UUUU does not require COMS.
§ 63.8(c)(5)	COMS Minimum Procedures.	COMS minimum procedures	No. Subpart UUUU does not require COMS.
§ 63.8(c)(6)	CMS Requirements	Zero and high level calibration check requirements; out-of-control periods.	No. Replaced with language in § 63.5545.
§ 63.8(c)(7) and (8)	CMS Requirements	Out-of-control periods, including reporting	No. Replaced with language in § 63.5580(c)(6).

Citation	Subject	Brief description	Applies to Subpart UUUU
§ 63.8(d)	CMS Quality Control	Requirements for CMS quality control, including calibration, etc.; must keep quality control plan on record for 5 years; keep old versions for 5 years after revisions; program of correction action to be included in plan required under § 63.8(d)(2).	No, except for requirements in § 63.8(d)(2).
§ 63.8(e)	CMS Performance Evaluation.	Notification, performance evaluation test plan, reports.	Yes, except that § 63.8(e)(5)(ii) does not apply because subpart UUUU does not require COMS.
§ 63.8(f)(1) through (5)	Alternative Monitoring Method.	Procedures for Administrator to approve alternative monitoring.	Yes, except that no site-specific test plan is required. The request to use an alternative monitoring method must be submitted with the notification of performance test or CEMS performance evaluation or 60 days prior to any initial compliance demonstration.
§ 63.8(f)(6)	Alternative to Relative Accuracy Test.	Procedures for Administrator to approve alternative relative accuracy tests for CEMS.	Yes.
§ 63.8(g)(1) through (4)	Data Reduction	COMS 6-minute averages calculated over at least 36 evenly spaced data points; CEMS 1-hour averages computed over at least four equally spaced data points; data that cannot be used in average.	No. Replaced with language in § 63.5545(e).
§ 63.8(g)(5)	Data Reduction	Data that cannot be used in computing averages for CEMS and COMS.	No. Replaced with language in § 63.5560(b).
§ 63.9(a)	Notification Requirements.	Applicability and State delegation	Yes.
§ 63.9(b)(1) through (5)	Initial Notifications	Submit notification subject 120 days after effective date; notification of intent to construct or reconstruct; notification of commencement of construction or reconstruction; notification of startup; contents of each.	Yes.
§ 63.9(c)	Request for Compliance Extension.	Can request if cannot comply by date or if installed BACT/LAER.	Yes.
§ 63.9(d)	Notification of Special Compliance Requirements for New Source.	For sources that commence construction between proposal and promulgation and want to comply 3 years after effective date.	Yes.
§ 63.9(e)	Notification of Performance Test.	Notify Administrator 60 days prior	Yes.
§ 63.9(f)	Notification of VE or Opacity Test.	Notify Administrator 30 days prior	Yes, but only for flares for which EPA Method 22 observations are required as part of a flare compliance assessment.
§ 63.9(g)	Additional Notifications When Using CMS.	Notification of performance evaluation; notification using COMS data; notification that exceeded criterion for relative accuracy.	Yes, except that § 63.9(g)(2) does not apply because subpart UUUU does not require COMS.
§ 63.9(h)(1) through (6)	Notification of Compliance Status Report.	Contents; due 60 days after end of performance test or other compliance demonstration, except for opacity or VE, which are due 30 days after; when to submit to federal vs. state authority.	Yes, except that Table 7 to this subpart specifies the submittal date for the notification. The contents of the notification will also include the results of EPA Method 22 observations required as part of a flare compliance assessment.
§ 63.9(i)	Adjustment of Submittal Deadlines.	Procedures for Administrator to approve change in when notifications must be submitted.	Yes.
§ 63.9(j)	Change in Previous Information.	Must submit within 15 days after the change	Yes, except that the notification must be submitted as part of the next semiannual compliance report, as specified in Table 8 to this subpart.
§ 63.10(a)	Recordkeeping and Reporting.	Applies to all, unless compliance extension; when to submit to federal vs. state authority; procedures for owners of more than one source.	Yes.
§ 63.10(b)(1)	Recordkeeping and Reporting.	General requirements; keep all records readily available; keep for 5 years.	Yes.
§ 63.10(b)(2)(i)	Recordkeeping of Occurrence and Duration of Startups and Shutdowns.	Records of occurrence and duration of each startup or shutdown that causes source to exceed emission limitation.	No, for new or reconstructed sources which commenced construction or reconstruction after September 9, 2019.For all other affected sources, Yes before December 29, 2020, and No thereafter.

Citation	Subject	Brief description	Applies to Subpart UUUU
§ 63.10(b)(2)(ii)	Recordkeeping of Failures to Meet a Standard.	Records of occurrence and duration of each malfunction of operation or air pollution control and monitoring equipment.	No, see Table 9 for recordkeeping of (1) date, time and duration; (2) listing of affected source or equipment, and an estimate of the quantity of each regulated pollutant emitted over the standard; and (3) actions to minimize emissions and correct the failure.
§ 63.10(b)(2)(iii)	Maintenance Records	Records of maintenance performed on air pollution control and monitoring equipment.	Yes.
§ 63.10(b)(2)(iv) and (v)	Actions Taken to Minimize Emissions During SSM.	Records of actions taken during SSM to minimize emissions.	No, for new or reconstructed sources which commenced construction or reconstruction after September 9, 2019. For all other affected sources, Yes before December 30, 2020, and No thereafter.
§ 63.10(b)(2)(vi), (x), and (xi).	CMS Records	Malfunctions, inoperative, out-of-control; calibration checks, adjustments, maintenance.	Yes.
§ 63.10(b)(2)(vii) through (ix).	Records	Measurements to demonstrate compliance with emission limits; performance test, performance evaluation, and opacity/VE observation results; measurements to determine conditions of performance tests and performance evaluations.	Yes, including results of EPA Method 22 observations required as part of a flare compliance assessment.
§ 63.10(b)(2)(xii)	Records	Records when under waiver	Yes.
§ 63.10(b)(2)(xiii)	Records	Records when using alternative to relative accuracy test.	Yes.
§ 63.10(b)(2)(xiv)	Records	All documentation supporting Initial Notification and Notification of Compliance Status Report.	Yes.
§ 63.10(b)(3)	Records	Applicability determinations	Yes.
§ 63.10(c)(1) through (6), (9) through (14).	Records	Additional records for CMS	Yes.
§ 63.10(c)(7) and (8)	Records	Records of excess emissions and parameter monitoring exceedances for CMS.	No. Replaced with language in Table 9 to this subpart.
§ 63.10(c)(15)	Use of SSM Plan	Use SSM plan to satisfy recordkeeping requirements for identification of malfunction, correction action taken, and nature of repairs to CMS.	No, for new or reconstructed sources which commenced construction or reconstruction after September 9, 2019. For all other affected sources, Yes before December 30, 2020, and No thereafter. See 40 CFR 63.5515(c).
§ 63.10(d)(1)	General Reporting Requirements.	Requirement to report	Yes.
§ 63.10(d)(2)	Report of Performance Test Results.	When to submit to federal or state authority	Yes, except that Table 7 to this subpart specifies the submittal date for the Notification of Compliance Status Report.
§ 63.10(d)(3)	Reporting Opacity or VE Observations.	What to report and when	Yes, but only for flares for which EPA Method 22 observations are required as part of a flare compliance assessment.
§ 63.10(d)(4)	Progress Reports	Must submit progress reports on schedule if under compliance extension.	Yes.
§ 63.10(d)(5)(i)	Periodic SSM Reports	Contents and submission of periodic SSM reports.	No, for new or reconstructed sources which commenced construction or reconstruction after September 9, 2019. For all other affected sources, Yes before December 30, 2020, and No thereafter. See § 63.5580(c)(4) and Table 8 for malfunction reporting requirements.
§ 63.10(d)(5)(ii)	Immediate SSM Reports.	Contents and submission of immediate SSM reports.	No, for new or reconstructed sources which commenced construction or reconstruction after September 9, 2019. For all other affected sources, Yes before December 29, 2020, except that the immediate SSM report must be submitted as part of the next semiannual compliance report, as specified in Table 8 to this subpart, and No thereafter.
§ 63.10(e)(1) and (2)	Additional CMS Reports.	Must report results for each CEMS on a unit; written copy of performance evaluation; three copies of COMS performance evaluation.	Yes, except that § 63.10(e)(2)(ii) does not apply because subpart UUUU does not require COMS.
§ 63.10(e)(3)(i) through (iii).	Reports	Schedule for reporting excess emissions and parameter monitor exceedance (now defined as deviations).	No. Replaced with language in § 63.5580.

Citation	Subject	Brief description	Applies to Subpart UUUU
§ 63.10(e)(3)(iv)	Excess Emissions Reports.	Requirement to revert to quarterly submission if there is an excess emissions and parameter monitor exceedance (now defined as deviations); provision to request semi-annual reporting after compliance for 1 year; submit report by 30th day following end of quarter or calendar half; if there has not been an exceedance or excess emission (now defined as deviations), report contents is a statement that there have been no deviations.	No. Replaced with language in § 63.5580.
§ 63.10(e)(3)(v)	Excess Emissions Reports.	Must submit report containing all of the information in § 63.10(c)(5) through (13), § 63.8(c)(7) and (8).	No. Replaced with language in § 63.5580.
§ 63.10(e)(3)(vi) through (viii).	Excess Emissions Report and Summary Report.	Requirements for reporting excess emissions for CMS (now called deviations); requires all of the information in § 63.10(c)(5) through (13), § 63.8(c)(7) and (8).	No. Replaced with language in § 63.5580.
§ 63.10(e)(4)	Reporting COMS Data	Must submit COMS data with performance test data.	No. Subpart UUUU does not require COMS.
§ 63.10(f)	Waiver for Recordkeeping or Reporting.	Procedures for Administrator to waive	Yes.
§ 63.11	Control and Work Practice Requirements.	Requirements for flares and alternative work practice for equipment leaks.	Yes.
§ 63.12	State Authority and Delegations.	State authority to enforce standards	Yes.
§ 63.13	Addresses	Addresses where reports, notifications, and requests are sent.	Yes.
§ 63.14	Incorporations by Reference.	Test methods incorporated by reference	Yes.
§ 63.15	Availability of Information and Confidentiality.	Public and confidential information	Yes.
§ 63.16	Performance Track Provisions.	Requirements for Performance Track member facilities.	Yes.

National Emission Standards for Hazardous Air Pollutants for Chemical Recovery Combustion Sources at Kraft, Soda, Sulfite, and Stand-Alone Semichemical Pulp Mills; Standards of Performance for Kraft Pulp Mill Affected Sources for Which Construction, Reconstruction, or Modification Commenced After May 23, 2013

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: The U.S. Environmental Protection Agency (EPA) is finalizing amendments to the National Emission Standards for Hazardous Air Pollutants (NESHAP) for Chemical Recovery Combustion Sources at Kraft, Soda, Sulfite, and Stand-alone Semichemical Pulp Mills, and the New Source Performance Standards (NSPS) for Kraft Pulp Mills constructed, reconstructed, or modified after May 23, 2013. The final rule clarifies how to set operating limits for smelt dissolving tank (SDT) scrubbers used at these mills and corrects cross-reference errors in both rules.

DATES: This final rule is effective on November 5, 2020.

ADDRESSES: The EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2014–0741. All documents in the docket are listed on the *https://www.regulations.gov/* website. Although listed, some information is not publicly available, *e.g.,* Confidential Business Information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the internet and will be publicly available only in hard copy form. Publicly available docket materials are available electronically through *https://www.regulations.gov/.* Out of an abundance of caution for members of the public and our staff, the EPA Docket Center and Reading Room are closed to the public, with limited exceptions, to reduce the risk of transmitting COVID–19. Our Docket Center staff will continue to provide remote customer service via email, phone, and webform.

FOR FURTHER INFORMATION CONTACT: For questions about this final action, contact Dr. Kelley Spence, Sector Policies and Programs Division (E143–03), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–3158; fax number: (919) 541–0516; and email address: *spence.kelley@epa.gov.*

SUPPLEMENTARY INFORMATION:

Preamble acronyms and abbreviations. We use multiple acronyms and terms in this preamble. While this list may not be exhaustive, to ease the reading of this preamble and for reference purposes, the EPA defines the following terms and acronyms here:

ADI Applicability Determination Index
CAA Clean Air Act
CFR Code of Federal Regulations
CRA Congressional Review Act
EPA U.S. Environnemental Protection Agency
ESP electrostatic precipitator
HAP hazardous air pollutant(s)
NAICS North American Industry Classification System
NESHAP national emission standards for hazardous air pollutants
NSPS new source performance standards
NTTAA National Technology Transfer and Advancement Act
OMB Office of Management and Budget
PFLA percent full load amperage
PM particulate matter
PRA Paperwork Reduction Act
RFA Regulatory Flexibility Act
RPM revolutions per minute
SDT smelt dissolving tank
UMRA Unfunded Mandates Reform Act

Background information. On October 31, 2019, the EPA proposed revisions to the NESHAP for Chemical Recovery Combustion Sources at Kraft, Soda, Sulfite, and Stand-Alone Semichemical Pulp Mills (40 CFR part 63, subpart MM) and the NSPS for Kraft Pulp Mills Constructed, Reconstructed, or Modified After May 23, 2013 (40 CFR part 60, subpart BBa) clarifying how to set operating limits for SDT scrubbers used at these mills and correcting cross-reference errors in both rules. The rules have similar requirements for setting operating limits for SDT scrubbers, therefore, similar revisions were proposed for both rules. See 84 FR 58356. In this action, the EPA is finalizing the proposed revisions with minor edits. The preamble includes a summary of the comments the EPA received and our responses resulting in improvements to the proposed rule. A summary of all public comments on the proposal and the EPA's specific responses to those comments is provided in the memorandum, ''*Response to Comments to Proposed Rule Amending 40 CFR part 63 Subpart MM and 40 CFR part 60 Subpart BBa,*'' included in the docket for this action. Redline versions of the regulatory language for 40 CFR part 63, subpart MM, and 40 CFR part 60, subpart BBa showing the final amendments resulting from this action and are also available in the docket.

Organization of this document. The information in this preamble is organized as follows:

I. General Information
A. Does this action apply to me?
B. Where can I get a copy of this document and other related information?
C. Judicial Review and Administrative Reconsideration
II. Final Amendments

A. What are the final amendments to the NESHAP?
B. What are the final amendments to the NSPS?
III. Summary of Cost, Environmental, and Economic Impacts
A. What are the affected sources?
B. What are the air quality impacts?
C. What are the cost impacts?
D. What are the economic impacts?
E. What are the benefits?
IV. Statutory and Executive Order Reviews
A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review
B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs
C. Paperwork Reduction Act (PRA)
D. Regulatory Flexibility Act (RFA)
E. Unfunded Mandates Reform Act (UMRA)
F. Executive Order 13132: Federalism
G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks
I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
J. National Technology Transfer and Advancement Act (NTTAA)
K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations
L. Congressional Review Act (CRA)

I. General Information

A. Does this action apply to me?

Table 1 of this preamble lists the NESHAP, NSPS, and associated regulated industrial source categories that are the subject of this final rule. Table 1 is not intended to be exhaustive, but rather provides a guide for readers regarding the entities that this final action is likely to affect. The final amendments, once promulgated, will be directly applicable to the affected sources. Federal, state, local, and tribal government entities will not be affected by this action. As defined in the *Initial List of Categories of Sources Under Section 112(c)(1) of the Clean Air Act Amendments of 1990* (see 57 FR 31576, July 16, 1992) and *Documentation for Developing the Initial Source Category List, Final Report* (see EPA–450/3–91–030, July 1992), the Pulp and Paper Production source category is any facility engaged in the production of pulp and/or paper. This category includes, but is not limited to, integrated mills (where pulp alone or pulp and paper or paperboard are manufactured on-site), non-integrated mills (where paper or paperboard are manufactured, but no pulp is manufactured on-site), and secondary fiber mills (where waste paper is used as the primary raw material). Examples of pulping methods include kraft, soda, sulfite, semi-chemical, and mechanical. The pulp and paper production process units include operations such as pulping, bleaching, and chemical recovery. A kraft pulp mill is defined as a facility engaged in kraft pulping and includes digester systems, brown stock washer systems, multiple-effect evaporator systems, condensate stripper systems, recovery furnaces, SDTs, and lime kilns.

TABLE 1—REGULATIONS AND INDUSTRIAL SOURCE CATEGORIES AFFECTED BY THIS FINAL ACTION

Source category	Name of action	NAICS [1] code
Pulp and Paper Production.	Chemical Recovery Combustion Sources at Kraft, Soda, Sulfite, and Stand-Alone Semichemical Pulp Mills (40 CFR part 63, subpart MM).	32211, 32212, 32213
Kraft Pulp Mills	Standards of Performance for Kraft Pulp Mill Affected Sources for Which Construction, Reconstruction, or Modification Commenced After May 23, 2013 (40 CFR part 60, subpart BBa).	322110

[1] North American Industry Classification System.

B. Where can I get a copy of this document and other related information?

In addition to being available in the docket, an electronic copy of this action is available on the internet. Following signature by the EPA Administrator, the EPA will post a copy of the action at *https://www.epa.gov/stationary-sources-air-pollution/kraft-soda-sulfite-and-stand-alone-semichemical-pulp-mills-mact-ii* and *https://www.epa.gov/stationary-sources-air-pollution/kraft-pulp-mills-new-source-performance-standards-nsps-40-cfr-60.* Following publication in the **Federal Register**, the EPA will post the **Federal Register** version of the final rule at this same website.

C. Judicial Review and Administrative Reconsideration

Under Clean Air Act (CAA) section 307(b)(1), judicial review of this action is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit (the court) by January 4, 2021. Under CAA section 307(b)(2), the requirements established by this final rule may not be challenged separately in any civil or criminal proceedings brought by the EPA to enforce the requirements.

Section 307(d)(7)(B) of the CAA further provides that only an objection to a rule or procedure which was raised with reasonable specificity during the period for public comment (including any public hearing) may be raised during judicial review. This section also provides a mechanism for the EPA to reconsider the rule if the person raising an objection can demonstrate to the Administrator that it was impracticable to raise such objection within the period for public comment or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule. Any person seeking to make such a demonstration should submit a Petition for Reconsideration to the Office of the Administrator, U.S. Environmental Protection Agency, Room 3000, WJC South Building, 1200 Pennsylvania Ave., NW, Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. Environmental Protection Agency, 1200 Pennsylvania Ave. NW, Washington, DC 20460.

II. Final Amendments

With this action, the EPA is finalizing amendments to the NESHAP for Chemical Recovery Combustion Sources at Kraft, Soda, Sulfite, and Stand-Alone Semichemical Pulp Mills (referred to hereafter as ''the NESHAP'') and the NSPS for Kraft Pulp Mills constructed, reconstructed, or modified after May 23, 2013 (referred to hereafter as ''the NSPS''). The amendments (referred to hereafter as the ''2019 proposed amendments'') were proposed on October 31, 2019 (84 FR 58356) to clarify how to set operating limits for SDT scrubbers used at these mills and correct cross-reference errors in both

rules. As explained in this section, clarification was needed to address parameter monitoring issues that arose during implementation of the 2017 amendments to the NESHAP (referred to hereafter as the ''2017 NESHAP amendments'') as a result of the Agency's residual risk and technology review. See 82 FR 47328, October 11, 2017.

A. What are the final amendments to the NESHAP?

1. Alternative To Monitoring Pressure Drop for Certain SDT Scrubbers

The 2017 NESHAP amendments added fan amperage [1] to 40 CFR 63.864(e)(10)(iii) as an alternative to monitoring pressure drop for SDT dynamic scrubbers that operate at ambient pressure and low-energy entrainment scrubbers where the fan speed does not vary. Fan amperage was added as an alternative monitoring parameter based on the EPA's review of alternative monitoring requests for these types of SDT scrubbers available in the EPA's Applicability Determination Index (ADI) (81 FR 97074, December 30, 2016). In these previously approved alternative monitoring requests, the EPA acknowledged that pressure drop is not the best indicator of particulate matter (PM)/hazardous air pollutant (HAP) control device performance when the SDT scrubber is a low-energy entrainment scrubber or a dynamic scrubber that operates near atmospheric pressure. Low-energy entrainment scrubbers use the rotation of the fan blade to shatter the scrubbing liquid into fine droplets, while at the same time accelerating the particles into the airstream. The PM removal efficiency of these scrubbers is a function of the number of liquid droplets produced (to create a large contacting surface area) and the velocity of the PM imparted by the fan blade, which in turn, are functions of the amount of scrubbing liquid introduced and the tip speed of the fan blade. Therefore, the most important parameters to continuously monitor are the scrubbing liquid flow rate and the fan rotational speed (as indicated by the amperage of the fan motor or revolutions per minute (RPM)).

In addition to adding fan amperage as a monitoring parameter, the 2017 NESHAP amendments also specified a method in 40 CFR 63.864(j)(5)(i)(A) for setting the fan motor amperage operating limit, requiring that the minimum fan amperage operating limit be set as the lowest of the 1-hour average fan amperage values associated with each run demonstrating compliance with the applicable emission limit. The intent of establishing the operating limit as the lowest 1-hour average fan amperage was to demonstrate that the scrubber was operating as intended and removing HAP accordingly, because fan amperage values can be correlated with fan speed. This seemed reasonable during the development of the 2017 NESHAP amendments because the fans on these units are constant speed fans and changes in the load to the fan motor (*e.g.,* changes in gas density/pressure or fan belt issues) result in changes in the amperage needed to maintain the constant speed. For example, a scrubber operating without any scrubbing liquid or exhaust gas would pull a certain amount of amperage on the fan motor to maintain a constant speed. When the exhaust gas and scrubbing liquid are added, the fan motor amperage will increase to maintain that speed. Based on this concept, the basis for the fan motor amperage operating limit in the 2017 NESHAP amendments was that a drop in fan motor amperage below a certain point showed that the motor would no longer turn the fan properly (because, for example, the belt that connects the motor to the fan was slipping or broken), which in turn would mean the scrubber was not operating as well as it was during the emissions performance test.

As facilities began to plan their repeat performance test required by the 2017 NESHAP amendments and determine the appropriate operating parameters, they discovered that the method dictated to set the fan motor amperage did not accurately represent proper scrubber performance and submitted alternative monitoring requests. The alternative monitoring requests that EPA received explained that setting the fan amperage operating limit as outlined in the 2017 NESHAP amendments at 40 CFR 63.864(j)(5)(i)(A) could result in a minimum limit that does not correlate with scrubber emissions-reduction performance and cannot be achieved at all times, leading to deviations of the amperage operating parameter even when the fan is turning as designed and the scrubber is operating properly to achieve the required HAP reduction. More details on these alternative monitoring requests were provided in the memorandum titled, *Smelt Dissolving Tank Scrubber Operating Parameter Review,* in the docket for the 2019 proposed amendments (EPA Docket Item No. EPA–HQ–OAR–2014–0741–0277).

As explained in the preamble to the 2019 proposed amendments, after reviewing how the SDT scrubbers in question operate, the EPA agrees that use of the average fan motor amperage measured during the performance test to establish the fan amperage limit as dictated in 40 CFR 63.864(j)(5)(i)(A) of the 2017 NESHAP amendments can be problematic because it does not necessarily correlate with proper operation of the scrubber. The EPA's intent with adding the fan motor amperage alternative as part of the 2017 NESHAP amendments was to add regulatory flexibility while ensuring proper scrubber operation, not to arbitrarily set an operating limit that may not be met, even while the SDT scrubber is operating properly. The requirement for determining the fan motor amperage during the performance test to set the minimum limit was included in the 2017 NESHAP amendments (40 CFR part 63, subpart MM) which apply to new and existing sources (see 82 FR 47328, October 11, 2017) and in the NSPS promulgated in 2014 (40 CFR part 60, subpart BBa) which applies to new sources only (*see* 79 FR 18952, April 4, 2014). The issue was not identified in public comments on either rule but was discovered as existing sources began to implement the 2017 NESHAP amendments.

Upon further review of the EPA's responses to historical alternative monitoring requests included in the ADI, recent requests for alternative monitoring, and other available information, we recognize that the requirement to monitor fan amperage directly and establish a minimum fan amperage limit based on the average amperage measured during the performance test may result in deviations even when the scrubber is properly operating. Some facilities were approved by the EPA to use indicators of fan operation closely related to fan amperage (*e.g.,* RPM) and engineering design considerations when setting the site-specific fan amperage limit indicative of proper scrubber operation. For more details, see the memorandum titled *Smelt Dissolving Tank Scrubber Operating Parameter Review,* in the docket for the 2019 proposed amendments (EPA Docket Item No. EPA–HQ–OAR–2014–0741–0277).

To continue with our original intent to measure scrubber performance with an alternative method in these rules, the EPA proposed this rule to modify the language at 40 CFR 63.864(e)(10)(iii) and (j)(5)(i) to clarify how wet scrubber parameter limits are to be established and that fan amperage or RPM can be used to demonstrate compliance for the

[1] Fan amperage refers to the amperage delivered to the fan motor.

SDT scrubbers in question. Specifically, the EPA proposed to replace 40 CFR 63.864(j)(5)(i)(A) with a requirement to set the minimum scrubbing liquid flow rate operating limit as the lowest of the 1-hour average scrubbing liquid flow rate values associated with each test run demonstrating compliance with the applicable emission limit. This requirement was inadvertently left out of the 2017 NESHAP amendments but was required by other sections of the rule. Additionally, we proposed to add a new subsection, 40 CFR 63.864(j)(5)(i)(B), to clarify how wet scrubber fan amperage operating limits should be established.

The proposed text in 40 CFR 63.864(j)(5)(i)(B) included the same requirement that was previously in the 40 CFR 63.864(j)(5)(i) introductory paragraph, which stated that the scrubber pressure drop operating limit must be set as the lowest of the 1-hour average pressure drop values associated with each test run demonstrating compliance with the applicable emission limit, but also added that for dynamic or low-energy entrainment scrubbers, operating limits could be set using one of three methods specified in paragraphs 40 CFR 63.864(j)(5)(i)(B)(*1*) through (*3*).

- In 40 CFR 63.864(j)(5)(i)(B)(*1*), the EPA proposed to clarify that, for SDT dynamic wet scrubbers operating at ambient pressure or for low-energy entrainment scrubbers where fan speed does not vary, the minimum fan amperage operating limit must be set as the midpoint between the lowest of the 1-hour average fan amperage values associated with each test run demonstrating compliance with the applicable emission limit and the no-load amperage value. Additionally, the proposed regulatory text specified that the no-load amperage value must be determined using manufacturers specifications or by performing a no-load test of the fan motor, and that it must be verified that the scrubber fan is operating within 5 percent of the design RPM during the emissions performance test. A definition of ''no-load fan amperage'' was proposed in 40 CFR 63.861.
- In 40 CFR 63.864(j)(5)(i)(B)(*2*), the EPA proposed to allow use of percent full load amperage (PFLA) to demonstrate compliance and require that the minimum PFLA to the fan motor be set as the percent of full load amperage under no-load, plus 10 percent. Because the no-load value represents the amperage pulled by the motor without a fan belt (*i.e.,* the fan is not engaged), the additional 10 percent was proposed to ensure that the belt has not broken, and the fan is engaged during operation. This new subsection also proposed requiring verification that the scrubber fan is operating within 5 percent of the design RPM during the emissions performance test.
- In 40 CFR 63.864(j)(5)(i)(B)(*3*), the EPA proposed to allow use of RPM to demonstrate compliance and a requirement that the minimum RPM be set at 95 percent of the design RPM. The EPA also proposed a conforming amendment in 40 CFR 63.867(c)(3)(iii)(C)(*1*) to incorporate this language.

Commenters on the 2019 proposed amendments supported the proposed methods for setting minimum operating limits in 40 CFR 63.864(j)(5)(i)(B)(*1*) and (*2*), except for the requirement to verify that the scrubber fan is operating within 5 percent of the design RPM during the emissions performance test. Commenters strongly opposed the requirement to verify the design RPM for reasons detailed in the response-to-comments memorandum, *Response to Comments to Proposed Rule Amending 40 CFR part 63 Subpart MM and 40 CFR part 60 Subpart BBa,* in the docket for this action. In brief, the commenters explained that facilities monitoring fan amperage may not have instrumentation in place to monitor fan RPM and may not have the design RPM value available; that there are safety issues associated with attempting to obtain a one-time measurement of RPM; and that operating within 5 percent of the design RPM during the emissions performance test is irrelevant if the performance test shows compliance with the PM emission limit and fan amperage (which is proportional to RPM) is monitored. In response to these comments, the requirement to verify that the scrubber fan is operating within 5 percent of the design RPM during the emissions performance test was removed from the final rule. All other requirements in 40 CFR 63.864(j)(5)(i)(B)(*1*) and (*2*) were finalized as proposed.

One commenter requested that the EPA modify the proposed definition of ''no load fan amperage'' by adding the following language to the end of the definition, ''or the coupling to a direct drive fan was disconnected.'' The phrase was added as requested for the final rule.

Regarding the proposed 40 CFR 63.864(j)(5)(i)(B)(*2*), a commenter requested clarification on how the minimum PFLA operating limit should be calculated for an SDT scrubber fan and suggested that the EPA present an example PLFA calculation in the preamble to the final rule. In response to this request, we clarified in the final rule that the PFLA is calculated by dividing the no-load amperage value by the highest of the 1-hour average fan amperage values associated with each test run demonstrating compliance with the applicable emission limit in 40 CFR 63.862 multiplied by 100 *and then adding 10 percent* (emphasis added). We are including the following example of how to calculate the minimum PFLA. However, we are not including this equation in the final rule to avoid the need to renumber several subsequent rule equations.

Minimum PFLA = (No-load fan amperage/highest 1-hour average of fan amperages) × 100% + 10%

Where:

- The no-load fan amperage represents the amperage pulled by the fan motor when the fan is operating under no-load determined using manufacturers specifications or by performing a no-load test of the fan motor.
- The highest 1-hour average of fan amperages is the highest of the 1-hour average fan amperage values associated with each test run demonstrating compliance with the applicable emission limit in 40 CFR 63.862.

For example, assume Facility ''A'' performs a no-load test of their SDT scrubber's fan motor by running the motor without the fan belt attached. The measured fan amperage during the no-load test is 70 amperage. During a performance test of the SDT scrubber, the highest 1-hour average of the fan amperage values associated with each of the three test runs demonstrating compliance with the applicable emission limit is 179 amperage. Using these two amperage values, Facility A would calculate the PFLA alternative operating parameter limit for their SDT scrubber fan as follows:

Minimum PFLA = (70/179) × 100% + 10% = 49%

One commenter addressed the proposed 40 CFR 63.864(j)(5)(i)(B)(*3*), which would require the minimum fan RPM limit to be set as 5 percent lower than the design RPM. The commenter stated that the EPA should revise this requirement to be 5 percent lower than the lowest 1-hour average RPM measured during each test run demonstrating compliance with the applicable emission limit. The commenter explained that a facility could have modified the fan motor such that it is no longer operating at the design RPM, or it could have no documentation of the design RPM, but it is the performance of the scrubber during the stack test that matters. In response to this comment, 40 CFR

63.864(j)(5)(i)(B)(*3*) was finalized by revising it to require that the minimum RPM be set as 5 percent lower than the lowest 1-hour average RPM associated with each test run demonstrating compliance with the applicable emission limit, as requested. The EPA agrees that an operating limit based on the lowest 1-hour average RPM measured during each test run (for facilities that measure RPM) is adequate to demonstrate ongoing operation of the SDT scrubber. The 5-percent margin suggested by the commenter will allow for variability. The conforming revisions to 40 CFR 63.867(c)(3)(iii)(C)(1) that acknowledge RPM as an operating parameter for SDT dynamic or low-energy scrubbers were also finalized as proposed.

2. Other NESHAP Amendments

In addition to clarifying how to set SDT fan amperage operating limits, the EPA also proposed to correct the following cross-reference errors in the promulgated 40 CFR part 63, subpart MM NESHAP:

- An incorrect paragraph reference in the definition of ''modification'' in 40 CFR 63.861;
- An incorrect paragraph reference in 40 CFR 63.864(e)(10)(iii), referring to 40 CFR 63.864(e)(3)(i) instead of 40 CFR 63.864(e)(10)(i) as intended;
- Omission of reference to wet scrubber liquid flow rate in 40 CFR 63.864(j)(5) which specifies how to establish operating limits; and
- Incorrect paragraph references in 40 CFR 63.864(j)(1), (3), and (5) which cross-referenced requirements that were proposed (81 FR 97046, December 30, 2016) but not finalized for establishing site-specific electrostatic precipitator (ESP) operating limits for secondary voltage and secondary current (or total secondary power) for each ESP collection field. Instead of finalizing site-specific ESP operating limits, the EPA finalized a requirement to maintain proper operation of the ESP's automatic voltage control (82 FR 47328, October 11, 2017), but inadvertently kept the cross-references to the proposed ESP operating limits in the final rule.

The EPA did not receive any comments on the first three corrections noted above and is finalizing these amendments as proposed.

A comment was received regarding the EPA's proposal to eliminate the reference to 40 CFR 63.864(e)(1) in 40 CFR 63.864(j)(1), (3), and (5) which pertain to determination of operating limits. The commenter stated that the EPA should also eliminate reference to 40 CFR 63.864(e)(2) in these sections because 40 CFR 63.864(e)(2) references 40 CFR 63.864(e)(1). The EPA agrees with the commenter's suggestion and eliminated the cross-reference to 40 CFR 63.864(e)(2) in 40 CFR 63.864(j)(1), (3), and (5) for the final amendments. 40 CFR 63.864(e)(2) specifies parameter monitoring requirements for kraft or soda recovery furnaces or lime kilns using an ESP followed by a wet scrubber. 40 CFR 63.864(e)(2) refers to 40 CFR 63.864(e)(1) to require facilities to maintain proper ESP automatic voltage control and refers to 40 CFR 63.864(e)(10) to require facilities to monitor wet scrubber parameters. While 40 CFR 63.864(j)(1), (3), and (5) no longer reference 40 CFR 63.864(e)(1) and (2), these sections retain the reference to 40 CFR 63.864(e)(10) with respect to wet scrubber operating limits.

B. What are the final amendments to the NSPS?

1. Alternative To Monitoring Pressure Drop for Certain SDT Scrubbers

The EPA proposed similar amendments to the fan amperage requirements in the NSPS as discussed in section II.A of this preamble for consistency between the NESHAP and NSPS that apply to the same scrubbers. Specifically, NSPS amendments were proposed for 40 CFR 60.284a(b)(2)(iii), (c)(3)(i), (c)(4), and (d)(4)(ii) and 40 CFR 60.287a(b)(4)(i) to add RPM language. As proposed, 40 CFR 60.284a(c)(4) referred to the procedures for establishing the SDT fan amperage operating limit in the NESHAP (40 CFR 63.864(j)(5)(i)(B)). A commenter requested that 40 CFR 60.284a(c)(4) specify how scrubber fan amperage operating limits should be set rather than referencing 40 CFR 63.864(j)(5)(i)(B) of the NESHAP (as proposed). The commenter noted that incorporation of the NESHAP reference is inappropriate because it requires the operating parameter limit to be set based on a performance test that demonstrates compliance with the applicable emission limit in 40 CFR 63.862, not 40 CFR 60.282a. In response to this comment, the EPA removed the reference to 40 CFR 63.864(j)(5)(i)(B) in 40 CFR 60.284a(c)(4) and replaced it with specific language describing how to set scrubber fan amperage operating parameter limits. The procedures added to the NSPS in 40 CFR 60.284a(c)(4) are consistent with the procedures specified in the NESHAP. The EPA also added the definition of ''no-load fan amperage'' to 40 CFR 60.281a because the definition is referenced in the language added in 40 CFR 63.864(j)(5)(i)(B).

2. Other NSPS Amendments

The EPA proposed to correct a cross-reference error in the promulgated Kraft Pulp Mills NSPS (40 CFR part 60, subpart BBa). Specifically, the EPA proposed to amend incorrect paragraph references in 40 CFR 60.285a(b)(1) and 60.285a(d)(1) intended to cross-reference the rule's oxygen correction equation. No comments were received on these changes so the EPA is finalizing these amendments as proposed.

III. Summary of Cost, Environmental, and Economic Impacts

A. What are the affected sources?

The sources affected by this action are chemical pulp mills that use SDTs equipped with low-energy entrainment scrubbers or dynamic scrubbers that operate near atmospheric pressure. We estimate that there are 54 facilities that utilize these types of scrubbers.

B. What are the air quality impacts?

There are no air quality impacts associated with the final amendments.

C. What are the cost impacts?

No cost impacts are estimated to be associated with this action because the action serves only to provide regulatory clarity. This action reduces the likelihood that facilities will choose to submit site-specific alternative monitoring requests but does not change the scope of any regulatory requirements.

D. What are the economic impacts?

There are no economic impacts associated with the final amendments.

E. What are the benefits?

Because these final amendments are not considered economically significant, as defined by Executive Order 12866, and because we did not estimate any emission reductions associated with the action, we did not estimate any benefits from reducing emissions.

IV. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at *https://www.epa.gov/laws-regulations/laws-and-executive-orders.*

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulations and Regulatory Review

This action is not a significant regulatory action and was, therefore, not submitted to the Office of Management and Budget (OMB) for review.

B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs

This action is not an Executive Order 13771 regulatory action because this action is not significant under Executive Order 12866.

C. Paperwork Reduction Act (PRA)

This action does not impose any new information collection burden under the PRA. OMB has previously approved the information collection activities contained in the existing regulation (40 CFR part 63, subpart MM) and has assigned OMB control number 2060–0377. This action does not change the information collection requirements.

D. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. This action will not impose any requirements on small entities. This action does not create any new requirements or burdens, and no costs are associated with this final action.

E. Unfunded Mandates Reform Act (UMRA)

This action does not contain any unfunded mandate as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. The action imposes no enforceable duty on any state, local, or tribal governments or the private sector.

F. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications, as specified in Executive Order 13175. The EPA does not know of any pulp mills owned or operated by Indian tribal governments or located within tribal lands. Thus, Executive Order 13175 does not apply to this action.

H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

The EPA interprets Executive Order 13045 as applying to those regulatory actions that concern environmental health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of ''covered regulatory action'' in section 2–202 of the Executive Order. This action is not subject to Executive Order 13045 because it does not concern an environmental health risk or safety risk.

I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This action is not subject to Executive Order 13211 because it is not a significant regulatory action under Executive Order 12866.

J. National Technology Transfer and Advancement Act (NTTAA)

This rulemaking does not involve technical standards.

K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes that this action does not have disproportionately high and adverse human health or environmental effects on minority populations, low-income populations, and/or indigenous peoples, as specified in Executive Order 12898 (59 FR 7629, February 16, 1994). This action does not affect the level of protection provided to human health or the environment.

L. Congressional Review Act (CRA)

This action is subject to the CRA, and the EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action is not a ''major rule'' as defined by U.S.C. 804(2).

List of Subjects

40 CFR Part 60

Environmental protection, Administrative practice and procedures, Air pollution control, Intergovernmental relations, Monitoring requirements.

40 CFR Part 63

Environmental protection, Administrative practice and procedures, Air pollution control, Hazardous substances, Intergovernmental relations, Reporting and recordkeeping requirements.

Andrew Wheeler,

Administrator.

For the reasons set forth in the preamble, the Environmental Protection Agency amends 40 CFR parts 60 and 63 as follows:

PART 60—STANDARDS OF PERFORMANCE FOR NEW STATIONARY SOURCES

■ 1. The authority citation for part 60 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart BBa—Standards of Performance for Kraft Pulp Mill Affected Sources for Which Construction, Reconstruction, or Modification Commenced After May 23, 2013

■ 2. In § 60.281a, add in alphabetical order the definition for ''No-load fan amperage'' to read as follows:

§ 60.281a Definitions.

* * * * *

No-load fan amperage means, for the purposes of this subpart, the amperage pulled by the fan motor when the fan is operating under no-load, specifically the amperage value the motor would use if the fan belt was removed or the coupling to a direct drive fan was disconnected.

* * * * *

■ 3. In § 60.284a, revise paragraphs (b)(2)(iii), (c)(3)(i), (c)(4), and (d)(4)(ii) to read as follows:

§ 60.284a Monitoring of emissions and operations.

* * * * *

(b) * * *

(2) * * *

(iii) As an alternative to pressure drop measurement under paragraph (b)(2)(i) of this section, a monitoring device for measurement of fan amperage or revolutions per minute (RPM) may be used for smelt dissolving tank dynamic scrubbers that operate at ambient pressure or for low-energy entrainment scrubbers where the fan speed does not vary.

* * * * *

(c) * * *

(3) * * *

(i) Calculate 12-hour block averages from the recorded measurements of wet scrubber pressure drop (or smelt dissolving tank scrubber fan amperage or RPM) and liquid flow rate (or liquid supply pressure), as applicable.

* * * * *

(4) During the initial performance test required in § 60.285a, the owner or operator must establish site-specific operating limits for the monitoring parameters in paragraphs (b)(2) through (4) of this section by continuously monitoring the parameters and determining the arithmetic average value of each parameter during the performance test. The arithmetic

average of the measured values for the three test runs establishes your minimum site-specific operating limit for each wet scrubber or ESP parameter (except for smelt dissolving tank scrubber fan amperage or RPM). For smelt dissolving tank scrubber fan amperage, set the minimum operating limit using one of the methods in paragraphs (c)(4)(i) or (ii) of this section. For smelt dissolving tank scrubber RPM, the minimum RPM must be set as specified in paragraph (c)(4)(iii) of this section. Multiple performance tests may be conducted to establish a range of parameter values. The owner or operator may establish replacement operating limits for the monitoring parameters during subsequent performance tests using the test methods in § 60.285a.

(i) The minimum fan amperage operating limit must be set as the midpoint between the lowest of the 1-hour average fan amperage values associated with each test run demonstrating compliance with the applicable emission limit in § 60.282a and the no-load amperage value. The no-load amperage value must be determined using manufacturers specifications, or by performing a no-load test of the fan motor for each smelt dissolving tank scrubber; or

(ii) The minimum percent full load amperage (PFLA) to the fan motor must be set as the percent of full load amperage under no-load, plus 10 percent. The PFLA is calculated by dividing the no-load amperage value by the highest of the 1-hour average fan amperage values associated with each test run demonstrating compliance with the applicable emission limit in § 60.282a multiplied by 100 and then adding 10 percent. The no-load amperage value must be determined using manufacturers specifications, or by performing a no-load test of the fan motor for each smelt dissolving tank scrubber.

(iii) The minimum RPM must be set as 5 percent lower than the lowest 1-hour average RPM associated with each test run demonstrating compliance with the applicable emission limit.

* * * * *

(d) * * *

(4) * * *

(ii) All 12-hour block average scrubber pressure drop (or fan amperage or RPM, if used as an alternative under paragraph (b)(2)(iii) of this section) measurements below the minimum site-specific limit established during performance testing during times when BLS or lime mud is fired (as applicable), except during startup and shutdown.

* * * * *

■ 4. In § 60.285a, revise paragraphs (b)(1) and (d)(1) to read as follows:

§ 60.285a Test methods and procedures.

* * * * *

(b) * * *

(1) Method 5 of appendix A–3 of this part must be used to determine the filterable particulate matter concentration. The sampling time and sample volume for each run must be at least 60 minutes and 0.90 dscm (31.8 dscf). Water must be used as the cleanup solvent instead of acetone in the sample recovery procedure. The particulate concentration must be corrected to the appropriate oxygen concentration according to § 60.284a(c)(1)(iii).

* * * * *

(d) * * *

(1) Method 16 of appendix A–6 of this part must be used to determine the TRS concentration. The TRS concentration must be corrected to the appropriate oxygen concentration using the procedure in § 60.284a(c)(1)(iii). The sampling time must be at least 3 hours, but no longer than 6 hours.

* * * * *

■ 5. In § 60.287a, revise paragraph (b)(4)(i) to read as follows:

§ 60.287a Recordkeeping.

* * * * *

(b) * * *

(4) * * *

(i) Records of the pressure drop of the gas stream through the control equipment (or smelt dissolving tank scrubber fan amperage or RPM), and

* * * * *

PART 63—NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

■ 6. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart MM—National Emission Standards for Hazardous Air Pollutants for Chemical Recovery Combustion Sources at Kraft, Soda, Sulfite, and Stand-Alone Semichemical Pulp Mills

■ 7. In § 63.861, revise the definition for ''Modification'' and add in alphabetical order the definition for ''No-load fan amperage'' to read as follows:

§ 63.861 Definitions.

* * * * *

Modification means, for the purposes of § 63.862(a)(1)(ii)(D)(*1*), any physical change (excluding any routine part replacement or maintenance) or operational change that is made to the air pollution control device that could result in an increase in PM emissions.

* * * * *

No-load fan amperage means, for purposes of this subpart, the amperage pulled by the fan motor when the fan is operating under no-load, specifically the amperage value the motor would use if the fan belt was removed or the coupling to a direct drive fan was disconnected.

* * * * *

■ 8. In § 63.864, revise paragraphs (e)(10)(iii), (j)(1), (3), and (5) to read as follows:

§ 63.864 Monitoring requirements.

* * * * *

(e) * * *

(10) * * *

(iii) As an alternative to pressure drop measurement under paragraph (e)(10)(i) of this section, a monitoring device for measurement of fan amperage or fan revolutions per minute (RPM) may be used for smelt dissolving tank dynamic scrubbers that operate at ambient pressure or for low-energy entrainment scrubbers where the fan speed does not vary.

* * * * *

(j) * * *

(1) During the initial or periodic performance test required in § 63.865, the owner or operator of any affected source or process unit must establish operating limits for the monitoring parameters in paragraphs (e)(10) through (14) of this section, as appropriate; or

* * * * *

(3) The owner or operator of an affected source or process unit may establish expanded or replacement operating limits for the monitoring parameters listed in paragraphs (e)(10) through (14) of this section and established in paragraph (j)(1) or (2) of this section during subsequent performance tests using the test methods in § 63.865.

* * * * *

(5) New, expanded, or replacement operating limits for the monitoring parameter values listed in paragraphs (e)(10) through (14) of this section should be determined as described in paragraphs (j)(5)(i) and (ii) of this section.

(i) The owner or operator of an affected source or process unit that uses a wet scrubber must set minimum operating limits as described in paragraph (j)(5)(i)(A) and (B) of this section.

(A) Set the minimum scrubbing liquid flow rate operating limit as the lowest

of the 1-hour average scrubbing liquid flow rate values associated with each test run demonstrating compliance with the applicable emission limit in § 63.862.

(B) Set the minimum scrubber pressure drop operating limit as the lowest of the 1-hour average pressure drop values associated with each test run demonstrating compliance with the applicable emission limit in § 63.862; or for a smelt dissolving tank dynamic wet scrubber operating at ambient pressure or for low-energy entrainment scrubbers where fan speed does not vary, set the minimum operating limit using one of the methods in paragraph (j)(5)(i)(B)(*1*) through (*3*) of this section.

(*1*) The minimum fan amperage operating limit must be set as the midpoint between the lowest of the 1-hour average fan amperage values associated with each test run demonstrating compliance with the applicable emission limit in § 63.862 and the no-load amperage value. The no-load amperage value must be determined using manufacturers specifications, or by performing a no-load test of the fan motor for each smelt dissolving tank scrubber; or

(*2*) The minimum percent full load amperage (PFLA) to the fan motor must be set as the percent of full load amperage under no-load, plus 10 percent. The PFLA is calculated by dividing the no-load amperage value by the highest of the 1-hour average fan amperage values associated with each test run demonstrating compliance with the applicable emission limit in § 63.862 multiplied by 100 and then adding 10 percent. The no-load amperage value must be determined using manufacturers specifications, or by performing a no-load test of the fan motor for each smelt dissolving tank scrubber; or

(*3*) The minimum RPM must be set as 5 percent lower than the lowest 1-hour average RPM associated with each test run demonstrating compliance with the applicable emission limit.

(ii) [Reserved]

* * * * *

■ 9. In § 63.867, revise paragraph (c)(3)(iii)(C)(*1*) to read as follows:

§ 63.867 Reporting requirements.

* * * * *

(c) * * *

(3) * * *

(iii) * * *

(C) * * *

(1) The operating limits established during the performance test for scrubbing liquid flow rate and pressure drop across the scrubber (or alternatively, fan amperage or RPM if used for smelt dissolving tank scrubbers).

* * * * *

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 180

[EPA–HQ–OPP–2020–0112; FRL–10015–69]

Thiamine Mononitrate; Exemption From the Requirement of a Tolerance

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This regulation establishes an exemption from the requirement of a tolerance for residues of thiamine mononitrate (CAS Reg. No. 532–43–4) when used as an inert ingredient (enzyme cofactor) in pesticide products applied to/on all growing crops pre-harvest, limited to 0.1% (by weight) in pesticide formulations. SciReg, Inc on behalf of Valagro, S.p.A submitted a petition to EPA under the Federal Food, Drug, and Cosmetic Act (FFDCA), requesting an establishment of an exemption from the requirement of a tolerance. This regulation eliminates the need to establish a maximum permissible level for residues of thiamine mononitrate when used in accordance with this exemption. Vitamin B1 is also known as thiamine mononitrate. Throughout this document and for purposes of issuing the tolerance, EPA is using the name ''thiamine mononitrate'' to be consistent with standard agency nomenclature for the identification of this substance.

DATES: This regulation is effective November 5, 2020. Objections and requests for hearings must be received on or before January 4, 2021 and must be filed in accordance with the instructions provided in 40 CFR part 178 (see also Unit I.C. of the **SUPPLEMENTARY INFORMATION**).

ADDRESSES: The docket for this action, identified by docket identification (ID) number EPA–HQ–OPP–2020–0112, is available at *http://www.regulations.gov* or at the Office of Pesticide Programs Regulatory Public Docket (OPP Docket) in the Environmental Protection Agency Docket Center (EPA/DC), West William Jefferson Clinton Bldg., Rm. 3334, 1301 Constitution Ave. NW, Washington, DC 20460–0001. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the OPP Docket is (703) 305–5805.

Due to the public health concerns related to COVID–19, the EPA Docket Center (EPA/DC) and Reading Room is closed to visitors with limited exceptions. The staff continues to provide remote customer service via email, phone, and webform. For the latest status information on EPA/DC services and docket access, visit *https://www.epa.gov/dockets.*

FOR FURTHER INFORMATION CONTACT: Marietta Echeverria, Registration Division (7505P), Office of Pesticide Programs, Environmental Protection Agency, 1200 Pennsylvania Ave. NW, Washington, DC 20460–0001; main telephone number: (703) 305–7090; email address: *RDFRNotices@epa.gov.*

SUPPLEMENTARY INFORMATION:

I. General Information

A. Does this action apply to me?

You may be potentially affected by this action if you are an agricultural producer, food manufacturer, or pesticide manufacturer. The following list of North American Industrial Classification System (NAICS) codes is not intended to be exhaustive, but rather provides a guide to help readers determine whether this document applies to them. Potentially affected entities may include:

- Crop production (NAICS code 111).
- Animal production (NAICS code 112).
- Food manufacturing (NAICS code 311).
- Pesticide manufacturing (NAICS code 32532).

B. How can I get electronic access to other related information?

You may access a frequently updated electronic version of 40 CFR part 180 through the Government Printing Office's e-CFR site at *http://www.ecfr50/cgi-bin/text-idx?&c=ecfr&tpl=/ecfrbrowse/Title40/40tab_02.tpl.*

C. How can I file an objection or hearing request?

Under FFDCA section 408(g), 21 U.S.C. 346a, any person may file an objection to any aspect of this regulation and may also request a hearing on those objections. You must file your objection or request a hearing on this regulation in accordance with the instructions provided in 40 CFR part 178. To ensure proper receipt by EPA, you must identify docket ID number EPA–HQ–OPP–2020–0112 in the subject line on the first page of your submission. All objections and requests for a hearing

National Emission Standards for Hazardous Air Pollutants: Engine Test Cells/Stands Residual Risk and Technology Review

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action finalizes the residual risk and technology review (RTR) conducted for the Engine Test Cells/Stands source category regulated under national emission standards for hazardous air pollutants (NESHAP). In addition, we are taking final action on amendments to the Engine Test Cells/Stands NESHAP addressing periods of startup, shutdown, and malfunction (SSM). These final amendments also include provisions regarding electronic reporting, as well as clarifying and technical corrections. These final amendments will result in improved compliance and implementation of the rule.

DATES: This final rule is effective on June 3, 2020. The incorporation by reference (IBR) of certain publications listed in the rule was approved by the Director of the Federal Register as of May 27, 2003.

ADDRESSES: The U.S. Environmental Protection Agency (EPA) has established a docket for this action under Docket ID No. EPA–HQ–OAR–2018–0753. All documents in the docket are listed on the *https://www.regulations.gov/* website. Although listed, some information is not publicly available, *e.g.,* Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *https://www.regulations.gov/,* or in hard copy at the EPA Docket Center, WJC West Building, Room Number 3334, 1301 Constitution Ave. NW, Washington, DC. The Public Reading Room hours of operation are 8:30 a.m. to 4:30 p.m. Eastern Standard Time (EST), Monday through Friday. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the EPA Docket Center is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: For questions about this final action, contact Christopher Werner, Sector Policies and Programs Division (D243–01), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–5133; fax number: (919) 541–4991; and email address: *werner.christopher@epa.gov.* For specific information regarding the risk modeling methodology, contact Ted Palma, Health and Environmental Impacts Division (C539–02), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–5470; fax number: (919) 541–0840; and email address: *palma.ted@epa.gov.* For information about the applicability of the NESHAP to a particular entity, contact Sara Ayres, Office of Enforcement and Compliance Assurance, U.S. Environmental Protection Agency, U.S. EPA Region 5 (Mail Code R–19J), 77 West Jackson Boulevard, Chicago, Illinois 60604; telephone number: (312) 353–6266; and email address: *ayres.sara@epa.gov.*

SUPPLEMENTARY INFORMATION:

Preamble acronyms and abbreviations. We use multiple acronyms and terms in this preamble. While this list may not be exhaustive, to ease the reading of this preamble and for reference purposes, the EPA defines the following terms and acronyms here:

AAP American Academy of Pediatrics

Background information. On May 8, 2019, the EPA proposed revisions to the Engine Test Cells/Stands NESHAP based on our RTR. In this action, we are finalizing decisions and revisions for the rule. We summarize some of the more significant public comments we timely received regarding the proposed rule and provide our responses in this preamble. A summary of all other public comments on the proposal and the EPA's responses to those comments is available in the document titled *Summary of Public Comments and Responses for the Residual Risk and Technology Review for Engine Test Cells/Stands,* which is available in the docket for this action (Docket ID No. EPA–HQ–OAR–2018–0753). A ''track changes'' version of the regulatory language that incorporates the changes in this action is available in the docket.

Organization of this document. The information in this preamble is organized as follows:

I. General Information
A. Does this action apply to me?
B. Where can I get a copy of this document and other related information?
C. Judicial Review and Administrative Reconsideration
II. Background
A. What is the statutory authority for this action?
B. What is the Engine Test Cells/Stands source category and how does the NESHAP regulate HAP emissions from the source category?

C. What changes did we propose for the Engine Test Cells/Stands source category in our May 8, 2019, proposal?
III. What is included in this final rule?
A. What are the final rule amendments based on the risk review for the Engine Test Cells/Stands source category?
B. What are the final rule amendments based on the technology review for the Engine Test Cells/Stands source category?
C. What are the final rule amendments addressing emissions during periods of SSM?
D. What other changes have been made to the NESHAP?
E. What are the effective and compliance dates of the standards?
IV. What is the rationale for our final decisions and amendments for the Engine Test Cells/Stands source category?
A. Residual Risk Review for the Engine Test Cells/Stands Source Category
B. Technology Review for the Engine Test Cells/Stands Source Category
C. SSM for the Engine Test Cells/Stands Source Category
D. Electronic Reporting Requirements for the Engine Test Cells/Stands Source Category
E. Technical and Editorial Changes for the Engine Test Cells/Stands Source Category
F. Additional Issue on Which Comment Was Requested: Prior Approval for an Aspect of Performance Testing
V. Summary of Cost, Environmental, and Economic Impacts and Additional Analyses Conducted
A. What are the affected facilities?
B. What are the air quality impacts?
C. What are the cost impacts?
D. What are the economic impacts?
E. What are the benefits?
F. What analysis of environmental justice did we conduct?
G. What analysis of children's environmental health did we conduct?
VI. Statutory and Executive Order Reviews
A. Executive Orders 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review
B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs
C. Paperwork Reduction Act (PRA)
D. Regulatory Flexibility Act (RFA)
E. Unfunded Mandates Reform Act (UMRA)
F. Executive Order 13132: Federalism
G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks
I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
J. National Technology Transfer and Advancement Act (NTTAA)
K. Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations
L. Congressional Review Act (CRA)

I. General Information

A. Does this action apply to me?

Regulated entities. Categories and entities potentially regulated by this action are shown in Table 1 of this preamble.

TABLE 1—NESHAP AND INDUSTRIAL SOURCE CATEGORIES AFFECTED BY THIS FINAL ACTION

Source category	NESHAP	NAICS [1] code
Engine Test Facilities	Engine Test Cells/Stands ...	333120, 333618, 333111, 334312, 336111, 336120, 336112, 336992, 336312, 336350, 54171, 541380, 333611, 336411, 336412, 336414, 92711.

[1] North American Industry Classification System.

Table 1 of this preamble is not intended to be exhaustive, but rather to provide a guide for readers regarding entities likely to be affected by the final action for the source category listed. To determine whether your facility is affected, you should examine the applicability criteria in the appropriate NESHAP. If you have any questions regarding the applicability of any aspect of this NESHAP, please contact the appropriate person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section of this preamble.

B. Where can I get a copy of this document and other related information?

In addition to being available in the docket, an electronic copy of this final action will also be available on the internet. Following signature by the EPA Administrator, the EPA will post a copy of this final action at: *https://www.epa.gov/stationary-sources-air-pollution/engine-test-cellsstands-national-emission-standards-hazardous-air.* Following publication in the **Federal Register**, the EPA will post the **Federal Register** version and key technical documents at this same website.

Additional information is available on the RTR website at *https://www.epa.gov/stationary-sources-air-pollution/risk-and-technology-review-national-emissions-standards-hazardous.* This information includes an overview of the RTR program and links to project websites for the RTR source categories.

C. Judicial Review and Administrative Reconsideration

Under Clean Air Act (CAA) section 307(b)(1), judicial review of this final action is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit (the Court) by August 3, 2020. Under CAA section 307(b)(2), the requirements established by this final rule may not be challenged separately in any civil or criminal proceedings brought by the EPA to enforce the requirements.

Section 307(d)(7)(B) of the CAA further provides that only an objection to a rule or procedure which was raised with reasonable specificity during the period for public comment (including any public hearing) may be raised during judicial review. This section also provides a mechanism for the EPA to reconsider the rule if the person raising an objection can demonstrate to the Administrator that it was impracticable to raise such objection within the period for public comment or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule. Any person seeking to make such a demonstration should submit a Petition for Reconsideration to the Office of the Administrator, U.S. EPA, Room 3000, WJC South Building, 1200 Pennsylvania Ave. NW, Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. EPA, 1200 Pennsylvania Ave. NW, Washington, DC 20460.

II. Background

A. What is the statutory authority for this action?

Section 112 of the CAA establishes a two-stage regulatory process to address emissions of hazardous air pollutants (HAP) from stationary sources. In the

first stage, we must identify categories of sources emitting one or more of the HAP listed in CAA section 112(b) and then promulgate technology-based NESHAP for those sources. ''Major sources'' are those that emit, or have the potential to emit, any single HAP at a rate of 10 tons per year (tpy) or more, or 25 tpy or more of any combination of HAP. For major sources, these standards are commonly referred to as maximum achievable control technology (MACT) standards and must reflect the maximum degree of emission reductions of HAP achievable (after considering cost, energy requirements, and non-air quality health and environmental impacts). In developing MACT standards, CAA section 112(d)(2) directs the EPA to consider the application of measures, processes, methods, systems, or techniques, including, but not limited to those that reduce the volume of or eliminate HAP emissions through process changes, substitution of materials, or other modifications; enclose systems or processes to eliminate emissions; collect, capture, or treat HAP when released from a process, stack, storage, or fugitive emissions point; are design, equipment, work practice, or operational standards; or any combination of the above.

For these MACT standards, the statute specifies certain minimum stringency requirements, which are referred to as MACT floor requirements, and which may not be based on cost considerations. See CAA section 112(d)(3). For new sources, the MACT floor cannot be less stringent than the emission control achieved in practice by the best-controlled similar source. The MACT standards for existing sources can be less stringent than floors for new sources, but they cannot be less stringent than the average emission limitation achieved by the best-performing 12 percent of existing sources in the category or subcategory (or the best-performing five sources for categories or subcategories with fewer than 30 sources). In developing MACT standards, we must also consider control options that are more stringent than the floor under CAA section 112(d)(2). We may establish standards more stringent than the floor, based on the consideration of the cost of achieving the emissions reductions, any non-air quality health and environmental impacts, and energy requirements.

In the second stage of the regulatory process, the CAA requires the EPA to undertake two different analyses, which we refer to as the technology review and the residual risk review. Under the technology review, we must review the technology-based standards and revise them ''as necessary (taking into account developments in practices, processes, and control technologies)'' no less frequently than every 8 years, pursuant to CAA section 112(d)(6). Under the residual risk review, we must evaluate the risk to public health remaining after application of the technology-based standards and revise the standards, if necessary, to provide an ample margin of safety to protect public health or to prevent, taking into consideration costs, energy, safety, and other relevant factors, an adverse environmental effect. The residual risk review is required within 8 years after promulgation of the technology-based standards, pursuant to CAA section 112(f). In conducting the residual risk review, if the EPA determines that the current standards provide an ample margin of safety to protect public health, it is not necessary to revise the MACT standards pursuant to CAA section 112(f).[1] For more information on the statutory authority for this rule, see 84 FR 20208, May 8, 2019.

B. What is the Engine Test Cells/Stands source category and how does the NESHAP regulate HAP emissions from the source category?

The EPA promulgated the Engine Test Cells/Stands NESHAP on May 27, 2003 (68 FR 28774). The standards are codified at 40 CFR part 63, subpart PPPPP. The engine test facilities industry consists of facilities that utilize engine test cells/stands for testing of uninstalled stationary or uninstalled mobile engines. The source category covered by this MACT standard currently includes 59 facilities.

As promulgated in 2003, the Engine Test Cells/Stands NESHAP applies to engine test cells/stands located at major sources of HAP emissions. Because the NESHAP regulates the testing of uninstalled stationary or uninstalled mobile engines, it does not regulate the testing of any final product (*e.g.,* automobile, boat, or power generator). Engine test cells/stands are used for research and development activities (*e.g.,* new model development, endurance testing) and for quality control at engine production facilities. More information about this source category can be found in the proposal. See 84 FR 20211, May 8, 2019.

Engine test cells/stands emit HAP in the exhaust gases from combustion of gaseous and liquid fuels in the engines tested. The emission rates and annual emissions vary based on the size and design of the engines tested, the types of fuels burned, and the number, type, and duration of tests performed. Fuels used during testing include, but are not limited to, biofuels, natural gas, propane, gasoline, kerosene, jet fuel, diesel, and various grades of fuel oil.

The sources of emissions are the exhaust gases from combustion of fuels in the engines being tested in the test cells/stands. The primary HAP present in the exhaust gases from engine test cells/stands are formaldehyde, benzene, acetaldehyde, and 1,3-butadiene.

The Engine Test Cells/Stands NESHAP provides the owner or operator of a new or reconstructed affected source used in whole or in part for testing internal combustion engines with rated power of 25 horsepower or more and located at a major source of HAP emissions two compliance options: (1) Reduce carbon monoxide (CO) or total hydrocarbons (THC) emissions in the exhaust from the new or reconstructed affected source to 20 parts per million by volume dry basis or less, at 15-percent oxygen content, or (2) reduce CO or THC emissions in the exhaust from the new or reconstructed affected source by 96 percent or more. If a new or reconstructed affected source elects to comply with the percent reduction emission limitation, the affected source must conduct an initial performance test to determine the capture and control efficiencies of the equipment and to establish operating limits to be achieved on a continuous basis.

C. What changes did we propose for the Engine Test Cells/Stands source category in our May 8, 2019, proposal?

On May 8, 2019, the EPA published a proposed rule in the **Federal Register** for the Engine Test Cells/Stands NESHAP, 40 CFR part 63, subpart PPPPP, that took into consideration the RTR analyses. In the proposed rule, we proposed: No revisions to the numerical emissions limit based on the risk analysis and technology review; to amend provisions addressing periods of SSM; to amend provisions regarding electronic reporting; and to make certain clarifying and technical corrections.

III. What is included in this final rule?

This action finalizes the EPA's determinations pursuant to the RTR provisions of CAA section 112 for the Engine Test Cells/Stands source category. This action also finalizes

[1] The Court has affirmed this approach of implementing CAA section 112(f)(2)(A): *NRDC* v. *EPA,* 529 F.3d 1077, 1083 (D.C. Cir. 2008) (''If EPA determines that the existing technology-based standards provide an 'ample margin of safety,' then the Agency is free to readopt those standards during the residual risk rulemaking.'').

changes to the NESHAP for that source category, including changes to SSM provisions, changes to electronic reporting requirements, as well as clarifying and technical corrections. This action also reflects certain revisions to the May 2019 proposal in consideration of comments received during the public comment period described in section IV of this preamble.

A. What are the final rule amendments based on the risk review for the Engine Test Cells/Stands source category?

This section introduces the final amendments to the Engine Test Cells/Stands NESHAP being promulgated pursuant to CAA section 112(f). As proposed, we are finalizing our finding that risks remaining after implementation of the existing MACT standards for this source category are acceptable. Similarly, as proposed, we are finalizing the determination that the current NESHAP provides an ample margin of safety to protect public health, and that a more stringent standard is not necessary to prevent an adverse environmental effect. Therefore, we are not finalizing any revisions to the numerical emission limits based on the analysis conducted under CAA section 112(f), and we are readopting the current standards.

B. What are the final rule amendments based on the technology review for the Engine Test Cells/Stands source category?

We determined that there are no developments in practices, processes, and control technologies that warrant revisions to the MACT standards for this source category. Therefore, we are not finalizing revisions to the MACT standards under CAA section 112(d)(6).

C. What are the final rule amendments addressing emissions during periods of SSM?

We are finalizing the proposed amendments to the Engine Test Cells/Stands NESHAP to remove or revise provisions related to SSM. In its 2008 decision in *Sierra Club* v. *EPA,* 551 F.3d 1019 (D.C. Cir. 2008), the Court vacated portions of two provisions in the EPA's CAA section 112 regulations governing the emissions of HAP during periods of SSM. Specifically, the Court vacated the SSM exemption contained in 40 CFR 63.6(f)(1) and 40 CFR 63.6(h)(1), holding that under section 302(k) of the CAA, emissions standards or limitations must be continuous in nature and that the SSM exemption violates the CAA's requirement that some CAA section 112 standards apply continuously. As detailed in section IV.D.1 of the proposal preamble (84 FR 20208, May 8, 2019), the Engine Test Cells/Stands NESHAP requires that the standards apply at all times (see 40 CFR 63.9305(a)), consistent with the Court decision in *Sierra Club* v. *EPA,* 551 F. 3d 1019 (D.C. Cir. 2008).

EPA is finalizing the SSM provisions as proposed without setting a separate standard for startup and shutdown as discussed in the proposal. See 84 FR 20226, May 8, 2019.

Further, the EPA is not finalizing standards for malfunctions. As discussed in the May 2019 proposal preamble, the EPA interprets CAA section 112 as not requiring emissions that occur during periods of malfunction to be factored into development of CAA section 112 standards, although the EPA has the discretion to set standards for malfunctions where feasible. See 84 FR 20226 (May 8, 2019), for further discussion of the EPA's rationale for the decision not to set standards for malfunctions, as well as a discussion of the actions a source could take in the unlikely event that a source fails to comply with the applicable CAA section 112(d) standards as a result of a malfunction event, given that administrative and judicial procedures for addressing exceedances of the standards fully recognize that violations may occur despite good faith efforts to comply and can accommodate those situations.

As is explained in more detail below, we are finalizing revisions to the General Provisions table to 40 CFR part 63, subpart PPPPP, to eliminate requirements that include rule language providing an exemption for periods of SSM. Additionally, we are finalizing our proposal to eliminate language related to SSM that treats periods of startup and shutdown the same as periods of malfunction, as explained further below. Finally, we are finalizing our proposal to revise the recordkeeping and reporting requirements as they relate to malfunctions, as further described below. As discussed in the proposal preamble, these revisions are consistent with the requirement in 40 CFR 63.9305(a) that the standards apply at all times. See 84 FR 20228–29, May 8, 2019.

D. What other changes have been made to the NESHAP?

Consistent with the proposal, the EPA is finalizing the electronic reporting requirements, specifically that owners and operators of engine test cells/stands submit electronic copies of required performance test reports, performance evaluation reports, and semiannual compliance reports through the EPA's Central Data Exchange (CDX) using the Compliance and Emissions Data Reporting Interface (CEDRI).

We are also finalizing additional changes to the NESHAP that address technical and editorial corrections, as proposed and as described in section IV.E of this preamble.

E. What are the effective and compliance dates of the standards?

The revisions to the MACT standards being promulgated in this action are effective on June 3, 2020. The compliance date for existing engine test cells/stands is December 1, 2020. New sources, including those that commenced construction or reconstruction after May 8, 2019, must comply with all of the revisions to the standards immediately upon the effective date of this action, June 3, 2020, or upon startup, whichever is later.

For existing affected sources, we are finalizing two changes, as proposed, that would impact ongoing compliance requirements for 40 CFR part 63, subpart PPPPP. As discussed elsewhere in this preamble, we are finalizing the requirement that performance test results, performance evaluation reports, and the semiannual reports using the new template be submitted electronically. We are also finalizing a change to the requirements for SSM by removing the exemption from the requirements to meet the standard during SSM periods and by removing the requirement to develop and implement an SSM plan, as proposed. We have experience with similar industries that have been required to convert reporting mechanisms, install necessary hardware, install necessary software, become familiar with the process of submitting performance test results electronically through the EPA's CEDRI, test these new electronic submission capabilities, reliably employ electronic reporting, and convert logistics of reporting processes to different time-reporting parameters. This experience shows that a time period of a minimum of 90 days, and more typically 180 days, is generally necessary to successfully complete these changes. Our experience with similar industries further shows that this sort of regulated facility generally requires a time period of 180 days to read and understand the amended rule requirements; evaluate their operations to ensure that they can meet the standards during periods of startup and shutdown as defined in the rule and make any necessary adjustments; adjust parameter monitoring and recording

systems to accommodate revisions; and update their operations to reflect the revised requirements. The EPA recognizes the confusion that multiple different compliance dates for individual requirements would create and the additional burden such an assortment of dates would impose. From our assessment of the timeframe needed for compliance with the entirety of the revised requirements, the EPA considers a period of 180 days to be the most expeditious compliance period practicable, and, thus, is finalizing the requirement that existing affected sources be in compliance with all of the revised requirements of this rule within 180 days of the rule's effective date.

IV. What is the rationale for our final decisions and amendments for the Engine Test Cells/Stands source category?

For each of the issues addressed in the proposed rule, this section provides a description of what we proposed and what we are finalizing for the issue, the EPA's rationale for the final decisions and amendments, and a summary of key public comments and responses. For all comments not discussed in this preamble, comment summaries, and the EPA's responses can be found in the comment summary and response document titled *Summary of Public Comments and Responses for the Residual Risk and Technology Review for Engine Test Cells/Stands,* which is available in the docket for this action.

A. Residual Risk Review for the Engine Test Cells/Stands Source Category

1. What did we propose pursuant to CAA section 112(f) for the Engine Test Cells/Stands source category?

Pursuant to CAA section 112(f), the EPA conducted a risk review and presented the results for the review, along with our proposed decisions regarding risk acceptability and ample margin of safety, in the May 2019 proposed rule for the Engine Test Cells/Stands source category (84 FR 20208, May 8, 2019). The results of the risk assessment are presented briefly in Table 2 of this preamble and in more detail in the residual risk document titled *Residual Risk Assessment for the Engine Test Cells/Stands Source Category in Support of the 2020 Risk and Technology Review Final Rule,* which is in the docket for this action.

TABLE 2—ENGINE TEST CELLS/STANDS INHALATION RISK ASSESSMENT RESULTS

Number of facilities [1]	Maximum individual cancer risk (in 1 million) [2]		Population at increased risk of cancer ≥1-in-1 million		Annual cancer incidence (cases per year)		Maximum chronic noncancer TOSHI [3]		Maximum screening acute noncancer HQ [4]
	Based on . . .		Based on . . .		Based on . . .		Based on . . .		Based on actual emissions level
	Actual emissions level	Allowable emissions level	Actual emissions level	Allowable emissions level	Actual emissions level	Allowable emissions level	Actual emissions level	Allowable emissions level	
59	20	70	2,700	190,000	0.005	0.02	0.1	0.5	HQ_{REL} = 9 (acrolein) HQ_{AEGL-1} = 0.4

[1] Number of facilities evaluated in the risk analysis.
[2] Maximum individual excess lifetime cancer risk due to HAP emissions from the source category.
[3] Maximum target organ-specific hazard index (TOSHI). The target organ system with the highest TOSHI for the source category is respiratory. The respiratory TOSHI was calculated using the California EPA (CalEPA) chronic reference exposure level (REL) for acrolein. The EPA is in the process of updating the Integrated Risk Information System (IRIS) reference concentration (RfC) for acrolein but did not complete this update prior to signature of this final rule.
[4] The maximum estimated acute exposure concentration was divided by available short-term threshold values to develop an array of hazard quotient (HQ) values. HQ values shown use the lowest available acute threshold value, which in most cases is the REL. When an HQ exceeds 1, we also show the HQ using the next lowest available acute dose-response value.

The results of the chronic inhalation cancer risk assessment, based on actual emissions, show the maximum individual excess lifetime cancer risk (MIR) posed by the 59 facilities is 20-in-1 million, with benzene, 1,3-butadiene, formaldehyde, and acetaldehyde emissions from reciprocating engine testing as the major contributors to the risk. The total estimated cancer incidence from this source category is 0.005 excess cancer cases per year, or one excess case every 200 years. About 2,700 people are estimated to have cancer risks greater than or equal to 1-in-1 million from HAP emitted by this source category, with 60 of those people estimated to have cancer risks above 10-in-1 million. The maximum chronic noncancer target organ-specific hazard index (TOSHI) value for the source category is 0.1 (respiratory) driven by emissions of acrolein, acetaldehyde, formaldehyde, and naphthalene from reciprocating engine testing. No one is exposed to TOSHI levels above 1.

The EPA also evaluated the cancer risk at the maximum emissions allowed by the MACT standard, or ''MACT-allowable emissions.'' Risk results from the inhalation risk assessment using the MACT-allowable emissions indicate that the cancer MIR is 70-in-1 million with benzene, 1,3-butadiene, formaldehyde, and acetaldehyde emissions from reciprocating engine testing driving the risks, and that the maximum chronic noncancer TOSHI value is 0.5 at the MACT-allowable emissions level with acrolein, acetaldehyde, formaldehyde, and naphthalene emissions from reciprocating engine testing driving the TOSHI. The total estimated cancer incidence from this source category considering allowable emissions is expected to be about 0.02 excess cancer cases per year or one excess case every 50 years. Based on MACT-allowable emission rates, approximately 190,000 people are estimated to have cancer risks above 1-in-1 million, with 500 of those people estimated to have cancer risks above 10-in-1 million. No people are estimated to have a noncancer hazard index (HI) above 1.

Table 1 of this preamble indicates that for the Engine Test Cells/Stands source category, the maximum acute HQ could be up to 9, driven by actual emissions of acrolein. To better characterize the potential health risks associated with estimated worst-case acute exposures to HAP, and in response to a key recommendation from the Science Advisory Board's peer review of the EPA's RTR risk assessment methodologies, we examined a wider range of available acute health metrics than we do for our chronic risk assessments. This is in acknowledgement that there are generally more data gaps and uncertainties in acute health reference

values than there are in chronic health reference values. By definition, the acute REL represents a health-protective level of exposure, with effects not anticipated below those levels, even for repeated exposures. However, the level of exposure that would cause health effects is not specifically known. Therefore, when an REL is exceeded and an Acute Exposure Guideline Level (AEGL–1) or Emergency Response Planning Guideline (ERPG–1) level is available (*i.e.,* levels at which mild, reversible effects are anticipated in the general public for a single exposure), we typically use them as an additional comparative measure, as they provide an upper bound for the threshold level of exposure above which exposed individuals could experience effects. As the exposure concentration increases above the acute REL, the potential for effects increases. The highest refined screening acute HQ value was 9 (based on the acute REL for acrolein). This value includes a refinement of determining the highest HQ value that occurs outside the boundaries of affected facilities. In this case the highest value (9) occurs adjacent to a property boundary in a remote wooded location. HQ values at all nearby residential locations are below 1. As noted previously, the highest HQ occurred when the primary source of the acrolein emissions from turbine engine testing operations was modeled with an hourly emissions multiplier of 9.5 times the annual emissions rate. For further information on the development of this multiplier, see Appendix 1 of the document titled *Residual Risk Assessment for the Engine Test Cells/Stands Source Category in Support of the 2020 Risk and Technology Review Final Rule,* which is available in the docket for this action. The analysis also conservatively assumes all emission points at the facility impact the same receptor at the same time. As presented in Table 2, no facilities are estimated to have an HQ greater than 1 based on an AEGL or an ERPG.

Regarding multipathway risk screening, of the 59 facilities in the source category, 21 facilities reported emissions of carcinogenic hazardous air pollutants known to be persistent and bio-accumulative in the environment (PB–HAP) (arsenic and polycyclic organic matter (POM)), and 23 facilities reported emissions of non-carcinogenic PB–HAP (cadmium and mercury). Three of these facilities reported emissions of a carcinogenic PB–HAP (arsenic) that exceeded a Tier 1 cancer screening threshold emission rate, and one facility reported emissions of non-carcinogenic PB–HAP (cadmium and mercury) that exceeded a Tier 1 noncancer screening threshold emission rate. For facilities that exceeded the Tier 1 multipathway screening threshold emission rate for one or more PB–HAP, we used additional facility site-specific information to perform a Tier 2 screening assessment and determined the maximum chronic cancer and noncancer impacts for the source category. Based on the Tier 2 multipathway cancer assessment, the arsenic emissions exceeded the Tier 2 screening threshold emission rate by a factor of 2. An exceedance of a screening threshold emission rate in any of the tiers cannot be equated with a risk value or an HQ (or HI). Rather, it represents a high-end estimate of what the risk or hazard may be. For example, a screening threshold emission rate of 2 for a non-carcinogen can be interpreted to mean that we are confident that the HQ would be lower than 2. Similarly, a tier screening threshold emission rate of 30 for a carcinogen means that we are confident that the risk is lower than 30-in-1 million. Our confidence comes from the conservative, or health-protective, assumptions encompassed in the screening tiers: We choose inputs from the upper end of the range of possible values for the influential parameters used in the screening tiers, and we assume that the exposed individual exhibits ingestion behavior that would lead to a high total exposure. The Tier 2 noncancer screening threshold emission rate for both mercury and cadmium emissions were below 1. Thus, based on the Tier 2 results presented above, additional screening or site-specific assessments were not deemed necessary.

The EPA also conducted an environmental risk screening assessment for the Engine Test Cells/Stands source category for the following pollutants: Arsenic, cadmium, hydrochloric acid (HCl), hydrogen fluoride (HF), lead, mercury (methyl mercury and mercuric chloride), and POM. In the Tier 1 screening analysis for PB–HAP (other than lead, which was evaluated differently), arsenic and POM emissions had no exceedances of any of the ecological benchmarks evaluated. Divalent mercury, methyl mercury, and cadmium emissions had Tier 1 exceedances at one facility of surface soil benchmarks by a maximum screening value of 3. A Tier 2 screening analysis was performed for divalent mercury, methyl mercury, and cadmium emissions. In the Tier 2 screening analysis, there were no exceedances of any of the ecological benchmarks evaluated for any of the pollutants. For lead, we did not estimate any exceedances of the secondary lead National Ambient Air Quality Standard (NAAQS). For HCl and HF, the average modeled concentration around each facility (*i.e.,* the average concentration of all off-site data points in the modeling domain) did not exceed any ecological benchmark. In addition, each individual modeled concentration of HCl and HF (*i.e.,* each off-site data point in the modeling domain) was below the ecological benchmarks for all facilities. Based on the results of the environmental risk screening analysis, we do not expect an adverse environmental effect as a result of HAP emissions from this source category.

An assessment of risk from facility-wide emissions was performed to provide context for the source category risks. The results of the facility-wide risk assessment for both MACT sources and non-MACT sources (*i.e.,* sources at the facility that are not included in the Engine Test Cells/Stands source category) indicate that 23 facilities included in the analysis have a facility-wide cancer MIR greater than or equal to 1-in-1 million, and 10 of those facilities have a facility-wide cancer MIR greater than or equal to 10-in-1 million. The maximum facility-wide cancer MIR is 70-in-1 million, mainly driven by emissions of chromium (VI) compounds from organic solvent (miscellaneous volatile organic compounds (VOC)) evaporation. The total estimated cancer incidence from the whole facility is 0.03 excess cancer cases per year, or one excess case every 33 years. Approximately 190,000 people were estimated to have cancer risks above 1-in-1 million from exposure to HAP emitted from both MACT and non-MACT sources at the 59 facilities in this source category, with 6,800 of those people estimated to have cancer risks above 10-in-1 million. The maximum facility-wide chronic noncancer TOSHI (neurological) for the source category is estimated to be less than 1 (at 0.4), mainly driven by emissions of lead compounds and hydrogen cyanide from open burning of rocket propellant (an industrial solid waste disposal process) and by trichloroethylene emissions from liquid waste (a general waste treatment process). None of the population around the 59 facilities are exposed to noncancer HI levels above 1, based on facility-wide emissions.

To examine the potential for any environmental justice issues that might be associated with the source category, the EPA performed a demographic analysis, which is an assessment of risks to individual demographic groups of the

populations living within 5 kilometers (km) and also the populations living within 50 km of the facilities. In each case, we found that just over 40 percent of the residents within these distances are classified as minority (compared to a national minority average of 38 percent of the population). When examining the population exposed to a cancer MIR at or above 1-in-1 million, we found that only 10 percent of them are categorized as minorities. Further, none of the population around the facilities is exposed to a chronic noncancer TOSHI greater than 1. For more information regarding the methodology and the results of the demographic analysis, see the technical report titled *Risk and Technology Review-Analysis of Demographic Factors for Populations Living Near Engine Test Cells/Stands Source Category Operations,* which is available in the docket for this action.

The EPA weighed all health risk factors in our risk acceptability determination, and we proposed that the residual risks from this source category are acceptable. We then considered whether the current NESHAP for the source category provides an ample margin of safety to protect public health, and whether more stringent standards are necessary to prevent an adverse environmental effect, by taking into consideration costs, energy, safety, and other relevant factors. In determining whether the current standards provide an ample margin of safety to protect public health, we examined the same risk factors that we investigated for our acceptability determination and also considered the costs, technological feasibility, and other relevant factors related to emission control options that might reduce risk associated with emissions from the source category. We proposed that the 2003 Engine Test Cells/Stands NESHAP requirements provide an ample margin of safety to protect public health. Based on the results of our environmental risk screening assessment, we also proposed that more stringent standards are not necessary to prevent an adverse environmental effect.

2. How did the risk review change for the Engine Test Cells/Stands source category?

Since proposal, neither the risk assessment nor our determinations regarding risk acceptability, ample margin of safety, or adverse environmental effects have changed.

3. What key comments did we receive on the risk review, and what are our responses?

The EPA received comments in support of and against the proposed risk review and our proposed determination that no revisions are warranted under CAA section 112(f)(2). Comments that were not supportive of the risk review were considered at length.

Comment: One commenter argued that the EPA had failed to quantify and reduce the health risks posed by lead emissions. The commenter noted that engine test cells/stands emit 0.03 tons of lead per year. The commenter noted that lead is particularly harmful to children and the developing fetus. The commenter was concerned the EPA had not quantified the health risks from lead emissions and disagreed with the Agency's determination that no individual source is causing an exceedance of the NAAQS for Lead. The commenter asserted that EPA must not ignore the health risks lead causes, given that lead is a well-known toxic heavy metal with diverse and severe health impacts for which there is no safe level for human exposure. In particular, the commenter stated that lead is associated with neurological, hematological, and immune effects on children and hematological, cardiovascular, and renal effects on adults. The commenter also noted that children are particularly sensitive to the effects of lead, including sensory, motor, cognitive, and behavioral impacts. The commenter further noted that no safe blood lead level in children has been identified; that low levels of lead in blood have been shown to affect IQ and academic achievement; and that the effects of lead exposure cannot be remedied. According to the commenter, a recent study found that for every 0.2 micrograms per deciliter (µg/dL) of lead in the blood, an adolescent's IQ was reduced one point. Children residing in poverty and black children face higher exposures to lead and are consequently more susceptible to lead's health impacts. Reproductive effects, such as decreased sperm count in men and spontaneous abortions in women, have been associated with lead exposure. The commenter noted that the EPA has classified lead as a probable human carcinogen.

The commenter disagreed with the EPA's use of the 2008 lead NAAQS as a benchmark for determining acceptable risk and argued that the EPA's assessment of the health risks for lead was inadequate. The commenter noted that the EPA, Centers for Disease Control and Prevention (CDC), CalEPA, and the American Academy of Pediatrics (AAP) acknowledge that no safe level of lead can be identified. By relying on the lead NAAQS rather than conducting an independent risk assessment, the commenter believed the EPA's risk assessment for lead was inadequate because the EPA had not assessed the inhalation risks (from breathing) and multipathway risks (from other types of exposure). The commenter argued that the EPA cannot presume that achieving an ambient air concentration of the NAAQS for lead is sufficient to ensure an acceptable health risk and provide an ''ample margin of safety to protect public health'' from lead for CAA section 112(f) purposes. The commenter observed that the NAAQS recognizes harm (including the loss of IQ points as an indicator of neurological harm) occurs below the level of the NAAQS.

The commenter also noted that the Children's Health Protection Advisory Committee (CHPAC) has advised the EPA to lower the lead NAAQS to 0.02 micrograms per cubic meter (µg/m^3) because the 2008 Lead NAAQS ''is insufficient to protect children's health.'' The commenter argued that the current NAAQS addresses air-related population mean IQ loss in excess of 2 points and recognizes that on average higher neurological harm is occurring under the 2008 lead NAAQS. The commenter believed that it is likely harm occurs below the level of the 2008 NAAQS and that it is unacceptable for the EPA to ignore the harm caused by lead emissions. The commenter argued that EPA must address and incorporate the best currently available information on children's exposure, including the CHPAC recommendation of lowering the lead standards to 0.02 µg/m^3 from the current NAAQS level of 0.15 µg/m^3. The commenter noted that the CDC has recognized that there is no safe level for lead exposure and uses a reference level of 5 µg/dL, while California's health benchmark level at which measurable neurological harm can occur is 1.0 µg/dL. The commenter recommended that the EPA use the Integrated Exposure Uptake Biokinetic model for infants and children and the Adult Lead Methodology for fetus. In addition, the commenter suggested that the EPA should update the residual risk assessment for this source category to include available test data on lead in soil and waterways and to evaluate the potential health impacts resulting from the emission of lead from each facility. The commenter believes that additional monitoring should also be required to ensure that lead emitted from a facility

is at low enough concentrations such that it does not raise an individual's blood lead level by 1 µg/dL.

Response: The EPA disagrees with the commenter's assertion that we failed to assess risks from either lead or lead compounds for the Engine Test Cells/Stands source category. The inhalation risks of lead were assessed using Human Exposure Model, Version 1.5.5 (HEM–3) and the RfC values documented in Table 1 of Appendix 8 of the document titled, *Residual Risk Assessment for the Engine Test Cells/Stands Source Category in Support of the 2019 Risk and Technology Review Proposed Rule.* The lead NAAQS was used to assess multipathway risk from lead emissions. See 84 FR 20218, May 8, 2019. The standard provided the benchmark for our decision that further assessment of health impacts from lead exposure from category sources is not necessary and is an otherwise appropriate use of the standard.

We also disagree with the commenter's assertion that either the use of the lead NAAQS does not sufficiently protect public health from lead emissions from this source category or the setting of the lead NAAQS did not reflect an adequate scientific assessment of risk. While recognizing that lead has been demonstrated to exert ''a broad array of deleterious effects on multiple organ systems,'' the lead NAAQS targets the effects associated with relatively lower exposures and associated blood lead levels, specifically nervous system effects in children, including cognitive and neurobehavioral effects (73 FR 66976, November 12, 2008). The EPA establishes the NAAQS at a level to protect sensitive subpopulations, such as children and pregnant women. The 2008 decision on the lead NAAQS was informed by an evidence-based framework for neurocognitive effects in young children. In applying the evidence-based framework, the EPA focused on a subpopulation of U.S. children, those living near air sources and more likely to be exposed at the level of the standard; to the same effect.[2] In addition, in reviewing and sustaining the primary lead NAAQS, we note that the Court specifically noted that the lead NAAQs was targeted to protect children living near lead sources: ''EPA explained that the scientific evidence showing the impact of lead exposure in young children in the United States led it 'to give greater prominence to children as the sensitive subpopulation in this review' and to focus its revision of the lead NAAQS on the 'sensitive subpopulation that is the group of children living near [lead emission] sources and more likely to be exposed at the level of the standard.' Given the scientific evidence on which it relied, the EPA's decision to base the revised lead NAAQS on protecting the subset of children likely to be exposed to airborne lead at the level of the standard was not arbitrary or capricious.'' *Coalition of Battery Recyclers,* 604 F. 3d 613, 618 (D.C. Cir. 2010).

As noted in the risk assessment document, there is no reference dose (RfD) or other comparable chronic health benchmark value for lead compounds. In 1988, the EPA's IRIS program also reviewed the health effects data regarding lead and its inorganic compounds and determined that it would be inappropriate to develop an RfD for these compounds, stating, ''A great deal of information on the health effects of lead has been obtained through decades of medical observation and scientific research. This information has been assessed in the development of air and water quality criteria by the Agency's Office of Health and Environmental Assessment (OHEA) in support of regulatory decision-making by the Office of Air Quality Planning and Standards and by the Office of Drinking Water. By comparison to most other environmental toxicants, the degree of uncertainty about the health effects of lead is quite low. It appears that some of these effects, particularly changes in the levels of certain blood enzymes and in aspects of children's neurobehavioral development may occur at blood lead levels so low that a threshold has yet to be determined. The Agency's RfD Work Group discussed inorganic lead (and lead compounds) at two meetings (07/08/1985 and 07/22/1985) and considered it inappropriate to develop an RfD for inorganic lead.''

The EPA's IRIS assessment for lead and lead compounds (inorganic) (CASRN 7439–92–1) can be found at: *https://www.epa.gov/iris/subst/0277.htm.*

With regard to the information identified by the commenter, much of this information was similar to information available at the time of the 2008 NAAQS decision. For example, in 2005, the CDC recognized the evidence of adverse health effects in children with blood lead levels below 10 µg/dL, and that there is no safe level of blood lead in young children.[3] The commenter also cites a benchmark analysis by California EPA OEHHA that was completed during the time of the last review.[4] The quantitative relationship from this analysis of a correlation of one IQ point change with a 1.0 µg/dL change in blood lead is actually a substantially smaller change in IQ per µg/dL blood lead than the slope of 1.75 IQ points per µg/dL blood lead used in the evidence-based framework that the Administrator relied upon in his 2008 decision on a revised level for the lead NAAQS (73 FR 66964, November 12, 2008). Regarding the CHPAC recommendation on level and averaging time referenced by the commenter, this was made to the EPA in January 2015 in the context of the current NAAQS review and the same comment was made and considered in the 2008 review that concluded with the current lead NAAQS.

We also disagree with the comment that EPA cannot presume that achieving an ambient air concentration of the NAAQS for lead is sufficient to ensure acceptable health risk and provide an ''ample margin of safety to protect public health'' from lead for CAA section 112(f) purposes. The EPA considered the primary NAAQS for lead—which incorporates an adequate margin of safety—in determining whether lead risks (taken together with cancer and other noncancer health risks) from air-borne lead from engine test facilities are acceptable or unacceptable, under CAA section 112(f)(2). As explained at proposal, ample margin of safety determinations, under CAA section 112(f)(2) are conducted separately, in accord with the two-step framework set forth in the Benzene NESHAP and *NRDC* v. *EPA* (the Vinyl Chloride Decision), 824 F. 2d at 1165, 1166 (D.C. Cir. 1987) and *NRDC* v. *EPA,* 902 F. 2d 962, 973–74 (D.C. Cir. 1990) (distinguishing the NAAQS process,

[2] See for example, 73 FR 67000/3—''The framework in effect focuses on the sensitive subpopulation that is the group of children living near sources and more likely to be exposed at the level of the standard. The evidence-based framework estimates a mean air-related IQ loss for this subpopulation of children; it does not estimate a mean for all U.S. children''; see also 73 FR 67005/1—''the air-related IQ loss framework provides estimates for the mean air-related IQ loss of a subset of the population of U.S. children, and there are uncertainties associated with those estimates. It provides estimates for that subset of children likely to be exposed to the level of the standard, which is generally expected to be the subpopulation of children living near sources who are likely to be most highly exposed.''

whereby the margin of safety analysis is incorporated as part of the standard without a two-step analysis, from residual risk determinations).[5] See 84 FR 20218 n.28.

After review of all the comments received, we determined that no changes needed to be made to the underlying risk assessment methodology. Additional comments and our specific responses can be found in the document titled *Summary of Public Comments and Responses for the Residual Risk and Technology Review for Engine Test Cells/Stands,* which is available in the docket for this action.

4. What is the rationale for our final approach and final decisions for the risk review?

The EPA evaluated all of the comments on the EPA's risk review and determined that no changes to the review are needed. For the reasons explained in the proposed rule, we proposed that the risks from the Engine Test Cells/Stands source category are acceptable, and the current standards provide an ample margin of safety to protect public health and prevent an adverse environmental effect. Therefore, pursuant to CAA section 112(f)(2), we are finalizing our risk review as proposed, and we are readopting the current standards.

B. Technology Review for the Engine Test Cells/Stands Source Category

1. What did we propose pursuant to CAA section 112(d)(6) for the Engine Test Cells/Stands source category?

Pursuant to CAA section 112(d)(6), the EPA conducted a technology review, which focused on identifying and evaluating developments in practices, processes, and control technologies for control of HAP emissions from engine testing facilities. No cost-effective developments in practices, processes, or control technologies were identified in our technology review to warrant revisions to the standards. More information concerning our technology review is in the memorandum titled *Technology Review for the Engine Test Cells/Stands Source Category,* which is in the docket for this action, and in the preamble to the proposed rule (84 FR 20208, May 8, 2019).

2. How did the technology review change for the Engine Test Cells/Stands source category?

The technology review has not changed since proposal.

3. What key comments did we receive on the technology review, and what are our responses?

The EPA received comments in support of the proposed determination from the technology review that no revisions were warranted under CAA section 112(d)(6). We also received comments asserting that the technology review was inadequate for a variety of reasons, primarily because of failure to consider control technologies developed since the original NESHAP.

Comment: One commenter noted that advances in diesel engine design had greatly reduced air emissions from diesel engine test cells over the last few years. The commenter stated that new diesel engines are cleaner than they used to be and, as a result, emissions from engine test cells and stands also declined because they are testing engines that are operating more cleanly and efficiently. The commenter noted the EPA is moving forward with new diesel truck standards. The commenter thought the changes in the emissions from engines should allow test cells to reduce their emissions. These advances, the commenter argued, are developments the EPA should take into account. The commenter thought the EPA should revise the emission standards based on the ability to reduce emissions due to cleaner engines. The EPA should evaluate advances in more efficient engines and operating technology; use of lower HAP fuels; and alternative engines that do not rely on HAP-emitting fuels. The commenter argued that the EPA did not evaluate or take into account any of these developments, which the commenter contended was ''unlawful, arbitrary, and capricious under § 7412(d)(6).''

Response: The EPA disagrees with the commenter's assertion that the existing MACT standard should be lowered due to new emission standards for diesel engines and advances in diesel engine design (presumably under CAA sections 202 and 213). We also disagree with the commenter's contention that by not considering these developments our technology review is ''unlawful, arbitrary and capricious.'' CAA section 112(d)(6) requires the EPA to conduct a technology review to determine if there are ''developments in practices, processes, or control technologies'' that may be appropriate to incorporate into existing standards. At proposal, we did not propose any revision to the current MACT standard under CAA section 112(d)(6). We explained that the technology basis for the MACT standard was the use of add-on capture systems and control devices *(i.e.,* thermal oxidizers or catalytic oxidizers) and that our technology review under CAA section 112(d)(6) did not identify any new or improved add-on control technology, or any new work practices, operational procedures, process changes, or pollution prevention approaches that reduce emissions in the category that have been implemented at engine testing operations since promulgation of the current NESHAP. See 84 FR 20225–26, May 8, 2019.

Additionally, the emission standards in 40 CFR part 63, subpart PPPPP apply to the collection of engine test cells/stands located at a major source of HAP emissions that are used to test uninstalled stationary engines or uninstalled mobile engines. The subpart PPPPP standards do not apply to individual engines or to final products, such as automobiles or light and heavy-duty trucks. Rather, the purpose of engine testing is to simulate the operation of a specific type of engine under certain environmental conditions. In some cases, the testing confirms a new or refurbished engine is assembled correctly and will function as intended. In other cases, the testing measures the durability and performance of a new engine design or a new engine component.

In sum, under the CAA section 112(d)(6) technology review, the EPA is concluding that there are no new cost-effective controls that would achieve further emissions reductions and that the existing numerical emission limits in the NESHAP should be retained. For these reasons, consistent with the EPA's proposal, the emission limits in the NESHAP are not being revised.

Comment: One commenter was concerned the EPA had not collected the best available information on current controls and thought the EPA should have requested information from pollution control manufacturers and distributors, consulted with states and local air districts, consulted with the Institute of Clean Air Companies, and requested information from pollution control and monitoring companies regarding developments in controls for HAP pollutants. The commenter believed this information was readily available to the EPA and failing to contact control manufacturers biased the EPA's technology review away from the most current developments. The commenter thought the EPA should have assessed the technologies and tools

[5] The Court was referring to the predecessor provision to the current CAA section 112(f), but its analysis is equally applicable to the revised provision.

available in the market for the control of the pollutants and provide the information for notice-and-comment. The commenter believed that providing this information to the public would have a positive impact on the regulated industry, as well as community members exposed to pollution. The commenter thought this information could lead facilities to implement pollution controls with which they are not currently familiar and would create jobs and increase the economic success both of the regulated facility and the company selling the control or monitoring tools.

Response: The EPA disagrees with the commenter. CAA section 112(d)(6) requires the EPA to review and revise standards ''as necessary (taking into account developments in practices, processes, and control technologies)'' no less often than every 8 years. Pursuant to CAA section 112(d)(6), the EPA may consider cost in deciding whether to revise existing standards. Our review of control technologies and current industry processes and practices identified no new cost-effective controls that would achieve further emission reductions. As explained in the proposal preamble, the EPA completed a technology review as part of this rulemaking, which focused on identifying and evaluating any developments in practices, processes, and control technologies that occurred since 2003. See 84 FR 20213–14, 20225–26, May 8, 2019. In conducting the technology review for the Engine Test Cells/Stands source category, the EPA looked for add-on control technology that was not identified during the original NESHAP development and for improvements to existing add-on controls. We also looked for new work practices, operational procedures, process changes, and pollution prevention alternatives that have the potential to reduce emissions. We conducted extensive research to help us identify developments in control technology, work practices and procedures that could potentially reduce HAP emissions. Developments in practices, processes, and control technologies were investigated through discussions with industry representatives, searches of the EPA's Reasonably Available Control Technology/Best Available Control Technology/Lowest Achievable Emissions Rate Clearinghouse, site visits, and literature searches. We met several times with industry representatives and visited engine test facilities at four different plants. We also included questions in a questionnaire that specifically asked companies to provide information on their add-on control devices and any work practices they use to reduce emissions. The questionnaire was completed by multiple companies and covered over 40 individual facilities known to operate engine test cells/stands. Fifteen of these facilities were located at major sources of HAP, while the remainder were located at area sources. The Agency's review found no new add-on control technology, no developments in existing add-on control technology, and no new work practices, operational changes, or pollution prevention practices that would result in further reductions in emissions from this source category. For a detailed discussion of the findings, please refer to the *Technology Review for the Engine Test Cells/Stands Source Category* memorandum, in the docket (Docket ID Item No. EPA–HQ–OAR–2018–0753–0031).

The EPA also reviewed numerous construction and operating permits issued by permitting authorities to major and area sources that operate engine test facilities. As part of these reviews, we looked for any new control technology or work practice standards required by a state or local agency. We also provided a 45-day comment period on our proposed conclusion that would allow industry, state, and local air agencies, control device manufacturers, and other stakeholders to provide information on any new technologies and work practices that we may have overlooked. However, no new technologies or work practice approaches were identified in the public comments we received. Commenters did not provide any additional information on control technology for this source category and the EPA did not receive any additional information based on the proposal. The EPA typically has wide latitude in determining the extent of data-gathering necessary to solve a problem and courts generally defer to the Agency's decision to proceed on the basis of imperfect scientific information, rather than to ''invest the resources to conduct the perfect study.'' *Sierra Club* v. *EPA,* 167 F. 3d 658, 662 (D.C. Cir. 1999).

For these reasons, the EPA is not persuaded by these comments and rather considers our review to be sufficiently rigorous. If any improvements in control technology, work practices, operational procedures, process changes, or pollution prevention approaches occurred since the 2003 NESHAP was finalized, we would have identified them. Since our review did not identify any improvements and no new methods have been identified during the public comment period, we are finalizing as proposed our determination that no changes to the emission standards are required pursuant to CAA section 112(d)(6).

Comment: One commenter noted that no reduction in emission limits for this source category has occurred since 2003 and stated that better control technology is available that would make further emission reductions possible.

Response: The EPA disagrees with the commenter. As explained previously, our review of control technologies and current industry processes and practices identified no new cost-effective controls that would achieve further emission reductions. Although the commenter stated that better technology is available, the commenter did not identify or provide evidence demonstrating any control technology that would achieve lower HAP emissions from engine test cells/stands. As explained previously, the Agency's review found no new add-on control technology, no developments in existing add-on control technology, and no new work practices, operational changes, or pollution prevention practices that would result in further reductions in emissions from this source category. For a detailed discussion of the findings of our technology review, please refer to the *Technology Review for the Engine Test Cells/Stands Source Category* memorandum, which is available in the docket (Docket ID Item No. EPA–HQ–OAR–2018–0753–0031).

Additional comments and our specific responses can be found in the comment summary and response document titled, *Summary of Public Comments and Responses for the Residual Risk and Technology Review for Engine Test Cells/Stands,* which is available in the docket for this action.

4. What is the rationale for our final approach for the technology review?

The EPA evaluated all of the comments on the EPA's technology review and determined that no changes to the review are needed. For the reasons explained in the proposed rule, we determined that no cost-effective developments in practices, processes, or control technologies were identified in our technology review to warrant revisions to the standards. More information concerning our technology review, and how we evaluate cost effectiveness, can be found in the memorandum titled *Technology Review for the Engine Test Cells/Stands Source Category,* which is available in the docket for this action, and in the

preamble to the proposed rule (84 FR 20208, May 8, 2019). Therefore, pursuant to CAA section 112(d)(6), we are finalizing our technology review as proposed.

C. SSM for the Engine Test Cells/Stands Source Category

1. What did we propose for the Engine Test Cells/Stands source category?

The EPA is finalizing the proposed amendments to the Engine Test Cells/Stands NESHAP to remove or revise provisions related to SSM. In its 2008 decision in *Sierra Club* v. *EPA,* 551 F.3d 1019 (D.C. Cir. 2008), the Court vacated portions of two provisions in the EPA's CAA section 112 regulations governing the emissions of HAP during periods of SSM. Specifically, the Court vacated the SSM exemption contained in 40 CFR 63.6(f)(1) and 40 CFR 63.6(h)(1), holding that under section 302(k) of the CAA, emissions standards or limitations must be continuous in nature and that the SSM exemption violates the CAA's requirement that some CAA section 112 standards apply continuously. The EPA proposed the amendments to remove or revise provisions related to SSM that are not consistent with the requirement that the standards apply at all times. More information concerning the elimination or revision of SSM provisions is detailed in the preamble to the proposed rule (84 FR 20208, May 8, 2019).

2. How did the SSM provisions change for the Engine Test Cells/Stands source category?

The EPA is finalizing the SSM provisions as proposed (84 FR 20208, May 8, 2019) with minor changes to the General Provisions table (Table 7) and related cross-references to correct inadvertent errors made at proposal. These include the following:

- Addition of language in Table 7 indicating that several provisions are still applicable for 180 days following the effective date of this final rule; and
- Removal of cross-references to SSM exemption-related provisions.

We also note that because the final sentence in 40 CFR 63.8(d)(3) refers to the General Provisions' SSM plan requirement which is no longer applicable, the EPA is adding to the rule at 40 CFR 63.9355(c)(5) text that is identical to 40 CFR 63.8(d)(3) except that the final sentence is replaced with the following sentence: ''The program of corrective action should be included in the plan required under § 63.8(d)(2).'' A public comment was also received on this issue and more information can be found in the comment summary and response document titled *Summary of Public Comments and Responses for the Residual Risk and Technology Review for Engine Test Cells/Stands,* which is available in the docket for this action;

For reasons more fully described in the preamble at proposal, we also proposed to revise 40 CFR 63.9305 to add regulatory text regarding the general duty to minimize emissions. However, a typographical error was inadvertently made at the end of the sentence, ''The general duty to minimize emissions does not require the owner or operator to make any further efforts to reduce emissions if levels required by the applicable standard have been achieve.'' This sentence should have read as follows, and we are finalizing it as such: ''The general duty to minimize emissions does not require the owner or operator to make any further efforts to reduce emissions if levels required by the applicable standard have been achieved.''

Also, for reasons more fully described at proposal, we proposed to revise 40 CFR 63.9355 to add regulatory text regarding the requirements to record actions taken to minimize emissions and to record corrective actions. However, in 40 CFR 63.9355(a)(6), we inadvertently left the words ''the cause'' out of the sentence that read, ''For each failure record the date, time and duration of each failure.'' This sentence should have read as follows, and we are finalizing it as such: ''For each failure record the date, time, the cause and duration of each failure.''

Finally, while we proposed to revise the performance testing requirement at 40 CFR 63.9321 to remove the language ''according to the requirements in § 63.7(e)(1)'' (because 40 CFR 63.7(e)(1) restated the SSM exemption), rule text showing this change was inadvertently not provided in the amendatory text appearing toward the end of the proposal document. Because this change, and the rationale for it, was adequately described in the proposal preamble, we are finalizing it as proposed.

3. What key comments did we receive on the SSM provisions, and what are our responses?

The EPA received comments related to our proposed revisions to the SSM provisions. One commenter generally supported the proposed revisions to the SSM provisions but disagreed with the Agency's approach to malfunctions.

Comment: One commenter disagreed with the EPA's assertion that the Agency has the discretion to set standards for malfunctions where feasible. The commenter asserted that the EPA has only the discretion provided by the CAA (See, *e.g., Clean Air Council* v. *EPA,* 862 F.3d at 9 (D.C. Cir. 2018)) and that the CAA does not give the EPA authority to set malfunction-based standards or exemptions (See 42 U.S.C. 7412(d), (h), and 7602(k)). The commenter noted the EPA has not acted on a petition for reconsideration that was filed when the EPA set a malfunction standard in the Refinery Sector Rule (See *Air Alliance Houston et al.* v. *EPA,* D.C. Cir. No. 16–1035 (filed February 7, 2016), which held amendments in abeyance pending EPA action on reconsideration). The commenter contends their reconsideration petition and comments filed in support of that petition and offered at the November 2016 public hearing have shown that the Refinery Sector Rule malfunction exemption is unlawful and arbitrary and should be removed from the standards. Since the EPA has not acted on the reconsideration petition and the Court has held the case in abeyance, the commenter said that no other similar proposals for other source categories should be made until the Refinery Sector Rule petition is resolved. The commenter maintains that the malfunction exemption in the Refinery Sector Rule remains under a cloud of substantial controversy and is unlawful and arbitrary.

Response: The EPA disagrees with the commenter's statement that the EPA lacks the authority to set standards for malfunctions. In fact, in the Court's decision in *Sierra Club* v. *EPA,* 551 F.3d 1019 (D.C. Cir. 2008) vacating the SSM exemption in EPA's regulations implementing CAA section 112, the Court held that under section 302(k) of the CAA, emissions standards or limitations must be continuous in nature and that when CAA sections 112 and 302(k) are read together, Congress has required that there must be continuous CAA section 112–compliant standards. Pursuant to that holding, the EPA must apply a standard to periods of malfunction. In this final rule, the EPA has removed the SSM exemption and has required compliance with the existing standards during periods of SSM. Thus, the EPA has set a standard for periods of SSM as required by the *Sierra Club* decision.

The commenter's discussion of the EPA's decision in the Refinery Sector Rule, to set a standard for a particular type of malfunction that is different than the standards that apply in other circumstances, is not relevant here because the standards in this final rule for engine test cells apply to at all times, including during periods of malfunction. The commenter also

characterizes the Refinery Sector Rule as containing a malfunction exemption, so it is not clear whether the commenter's concern is with a standard that applies during malfunctions. In any event, the commenter's claim that the EPA has no authority to set standards for malfunctions is inconsistent with the *Sierra Club* SSM case.

Additional comments and our specific responses can be found in the comment summary and response document titled *Summary of Public Comments and Responses for the Residual Risk and Technology Review for Engine Test Cells/Stands,* which is available in the docket for this action.

4. What is the rationale for our final approach for the SSM provisions?

The EPA evaluated all of the comments on the EPA's proposed amendments to the SSM provisions. For the reasons explained in the proposed rule (84 FR 20208, May 8, 2019) and in section III.C of this preamble, we are finalizing our approach for the SSM provisions as proposed other than the minor changes detailed previously.

D. Electronic Reporting Requirements for the Engine Test Cells/Stands Source Category

1. What did we propose for the Engine Test Cells/Stands source category?

The EPA proposed that owners and operators of engine test cells/stands must submit electronic copies of required performance test reports, performance evaluation reports, and semiannual compliance reports through the EPA's CDX using the CEDRI. More information concerning our proposal on electronic reporting requirements can be found in the proposed rule (84 FR 20208, May 8, 2019).

2. How did the electronic reporting provisions change for the Engine Test Cells/Stands source category?

Since proposal, the electronic reporting provisions have not changed.

3. What key comments did we receive on the electronic reporting provisions, and what are our responses?

The EPA received comments both in support of and against the proposed electronic reporting provisions.

Comment: One commenter supported the proposed use of electronic reporting but recommended the EPA make certain changes to the proposed reporting and recordkeeping requirements. The commenter supported electronic reporting if it reduces regulatory burden, provides flexibility, and creates efficiencies for regulated entities. Although the commenter was supportive of electronic reporting, they wanted to ensure there is an orderly transition to the new reporting system. The commenter requested that the EPA should address the following issues:

- The addition of electronic reporting should not establish any new data requirements beyond what is currently required by the regulation. All data reporting requirements should tie to a regulatory citation;
- The reporting system should allow companies the option to provide explanatory comments on data or information submitted;
- Electronic reporting should not place further restrictions on who is eligible to submit a report;
- Sufficient compliance time should be allowed for companies to implement the revised requirements and to integrate EPA and company systems;
- Regulatory language should allow companies to submit hardcopy reports if there are problems with the EPA's reporting system availability or company systems;
- Electronic reporting should allow companies to submit reports as Portable Document Format (PDF) documents;
- The reporting system should allow updates or corrections to be submitted;
- The EPA should work with other regulatory authorities (*i.e.,* states, local agencies) to establish comparable or compatible electronic systems. The commenter said that electronic reporting to the EPA would not reduce reporting burden if companies reporting electronically to the EPA still have to submit hardcopy reports to other agencies that do not have electronic systems; and
- Any reporting templates should be available for review at the time a rule is proposed.

Response: The EPA acknowledges the comment. The new requirement to submit reports electronically does not establish any new data requirements, will allow facilities to submit some performance test results as an attachment within the electronic reporting tool (ERT) as well as include additional information in the semiannual report in PDF, allows facilities to make corrections to submittals through the resubmittal process in CEDRI, provides sufficient time for facilities to understand and comply with the new method of submitting reports, and includes provisions allowing extensions to be approved for situations where a facility is unable to successfully submit a report by the reporting deadline due to circumstances beyond their control (*e.g.,* outages of the EPA's CEDRI). Further, once submitted and certified, reports can be accessed by facility personnel and authorized EPA, Regional, state, local, and tribal reviewers.

For the semiannual compliance reports, reporters must use the spreadsheet template provided by the EPA to submit information to CEDRI. Additional information may be supplied through the comment field or as additional attachments through the process described on the Welcome tab of the spreadsheet template. In the proposal, we solicited comment on the content, layout and overall design of the template and a copy of the proposed template was made available in the docket (see *Engine_Test_Cells_Semiannual_Spreadsheet_Template_Draft,* available at Docket ID Item No. EPA–HQ–OAR–2018–0753–0147). 84 FR 20229, May 8, 2019. We received public comments on the draft template, which we took into consideration when preparing the final semiannual compliance report template. A copy of the final semiannual compliance report template is available in the docket for this action (Docket ID No. EPA–HQ–OAR–2018–0753). The official version of the report template is available at the CEDRI homepage (*https://www.epa.gov/electronic-reporting-air-emissions/cedri*).

All facilities must submit their reports electronically. For reports that contain information claimed as CBI, reporters will submit redacted reports electronically and mail complete versions, including the CBI, on a compact disc, flash drive, or other electronic storage media to the EPA. Although facilities will not have the option to continue submitting reports in hardcopy, the EPA provides support for companies on the EPA's CEDRI website, accessed at *https://www.epa.gov/electronic-reporting-air-emissions/cedri.* An overview of the electronic data submission process is provided in the memorandum, *Electronic Reporting Requirements for New Source Performance Standards (NSPS) and National Emission Standards for Hazardous Air Pollutants (NESHAP) Rules,* available in Docket ID No. EPA–HQ–OAR–2018–0753.

Comment: One commenter thought that the EPA should provide a notice and comment period only through a **Federal Register** document for all future changes in reporting templates. According to the commenter, at proposal, the EPA noted that the compliance reporting template for engine test facilities will be available on the CEDRI website. At the time of the proposal, the template was only available in the rule docket. While stakeholders can review the template as

it exists currently, the commenter said that any future changes to the template should be made available to affected reporters for comment prior to being adopted. The commenter stated that facilities do not regularly check the CEDRI website and would not be aware of any changes to the template. If the EPA changes the template without notice, the commenter said that facilities may use the wrong template or find they are in noncompliance. The commenter noted that a notification of proposed rules is required to be published in the **Federal Register** pursuant to the CAA and the Administrative Procedures Act (APA). The commenter cited both section 307(d)(3) of the CAA and section 553(b) of the APA as support:

Section 307(d)(3) of the CAA states, in the case of any rule to which this subsection applies, notice of proposed rulemaking shall be published in the **Federal Register**, as provided under section 553(b) of Title 5 [of the United States Code], shall be accompanied by a statement of its basis and purpose and shall specify the period available for public comment. (42 U.S.C. 7607(d)(3)).

Section 553(b) of the APA states that general notice of proposed rulemaking shall be published in the **Federal Register**, unless persons subject thereto are named and either personally served or otherwise have actual notice thereof in accordance with law. Except when notice or hearing is required by statute, it does not apply to interpretative rules, general statements of policy, or rules of agency organization, procedure, or practice, or when the agency for good cause finds (and incorporates the finding and a brief statement of reasons therefor in the rules issued) that notice and public procedure thereon are impracticable, unnecessary, or contrary to the public interest. (5 U.S.C. 553(b).)

The commenter stated that none of the exceptions in the APA would apply to any future changes in reporting templates and noted that the **Federal Register** is the official publication for federal agencies to publish changes in regulatory requirements. The commenter said that companies typically monitor the **Federal Register** daily, but do not typically subscribe to the Clearinghouse for Inventories and Emissions Factors (CHIEF) Listserv or periodically review the CEDRI website. The commenter said that it is not practical for companies to also review the CHIEF Listserv and CEDRI websites and that posting revised templates to these sites is not a ''legally-sufficient substitute for the **Federal Register**.'' The commenter also said that the EPA should provide notice of any proposed changes to electronic reporting requirements in a **Federal Register** notice as this approach will provide the regulated community with the notice that they need to review any proposed regulatory changes, provide comments, and initiate compliance plans. The commenter believed that posting to an EPA website does not provide adequate notice that electronic reporting requirements have changed and recommended that the EPA only make future changes to the template if a **Federal Register** notice is issued and an opportunity for public comment is provided.

Response: The EPA disagrees that future changes to a reporting template require public notice and comment. This rulemaking establishes the process the EPA will use to notify owners/operators of the availability of revised forms and provided interested parties with an opportunity to comment on that process. The fact that the commenters prefer a different process does not mean that the EPA lacks the authority to adopt the process proposed. We are making the CEDRI forms consistent with the underlying regulations, and as such, the public has already had a chance to review and comment on the content of these reports. These underlying regulations establish clear and objective criteria for EPA to apply in future non-rulemaking actions. The application of regulatory criteria to future individual situations does not require notice and comment rulemaking, either under section 307(d) of the CAA or the APA.

The EPA has amended the template to display the date of creation and revision number of the template. The date of the final rule is not included in the template.

Comment: One commenter disagreed with the EPA's proposed extension provisions for CEDRI outages or force majeure events. The commenter thought the proposed extension provisions were ''unlawful and arbitrary.'' The commenter argued that the extension provisions do not set a firm deadline to either submit required reports or to request an extension of the reporting deadline. The commenter also disagreed with the provision: ''[t]he decision to accept the claim . . . and allow an extension to the reporting deadline is solely within the discretion of the Administrator'' and with the EPA's proposed definition of ''force majeure event.'' The commenter believed these provisions were too broad and vague and was concerned a facility would use these provisions to evade the compliance reporting deadlines that assure compliance with applicable standards.

The commenter also thought that the EPA lacked the authority to allow exceptions or extensions for a ''force majeure event'' under the CAA. The commenters said the CAA was enacted to protect public health and welfare, to reduce pollution and the harm it causes, including cancer and other serious health impacts from HAP. The commenter said that creating a ''malfunction exemption'' contravenes the CAA. The commenter noted that the concept of ''force majeure'' comes from contract law and is not applicable to the CAA because it is not a contract. The commenter noted that ''force majeure is a phrase coined primarily for the convenience of contracting parties wishing to describe the facts that create a contractual impossibility due to an 'Act of God.' (See 6 A. Corbin, Corbin on Contracts, section 1324 (1962)). As Corbin points out, this term is outmoded and serves no useful purpose as a test of responsibility.'' *Perlman* v. *Pioneer Limited Partnership,* 918 F.2d 1244, 1248 n.5 (5th Cir. 1990). The commenter urged the EPA to not apply the concept of ''force majeure'' to any part of the CAA and said that doing so would be a variation of the prior malfunction exemptions that were found to be unlawful under the CAA. (See, *e.g., Sierra Club* v. *EPA,* 551 F.3d 1028 (D.C. Cir. 2008); *NRDC,* 749 F.3d at 1062–63). The commenter argued that there is no ''force majeure'' exception allowed for non-compliance with the CAA or its requirements, and that the EPA may not create an exemption because ''the Clean Air Act and amendments thereto contain no force majeure exception.'' *U.S.* v. *Wheeling-Pittsburgh Steel Corp.,* 818 F.2d 1077, 1088 (3d Cir. 1987) (refusing to provide for a free-standing ''force majeure'' exception that would have exempted emission violations that fell outside the contractual term used in a consent decree due to the lack of legal basis to do so). The commenter noted that the Court explained: ''After a certain point, the transgression of regulatory limits caused by 'uncontrollable acts of third parties,' such as strikes, sabotage, operator intoxication or insanity, and a variety of other eventualities, must be a matter for the administrative exercise of case-by-case enforcement discretion, not for specification in advance by regulation.'' *Weyerhaeuser Co.* v. *Costle,* 590 F.2d 1011, 1058 (D.C. Cir. 1978).

The commenter thought that while CEDRI outages and some events may be out of a facility's control, the facility owners or operators have many factors within their control. The commenter said the EPA failed to evaluate the steps

a facility could take to predict and prevent delays in the reporting of pollution exceedances related to foreseeable types of events it defines as ''force majeure.'' If the EPA creates a ''force majeure event'' extension provision, the commenter recommended the facility be required to prevent similar problems in the future and report what steps it will take in the future to prevent the same problem from recurring. When there is such a problem, the commenter argued, the need for prompt reporting is important for ensuring actual emission exceedances end. The commenter asserted that allowing an unreasonable extension or not setting any deadline would be unlawful. The commenter thought reporting was especially important during the types of events described by the EPA. The commenter stated that reporting is necessary to protect public health and welfare.

The commenter also said the EPA did not identify any problems or burdens with the electronic reporting system that could justify an extension. The commenter noted that in a proposed rule for the Petroleum Refinery Sector, the EPA had stated: ''We note that the submission of ERT formatted performance test and performance evaluation reports using CEDRI is fully operational, and there are no known or reported system issues . . . In addition, the CDX Helpdesk staff are available during regular business hours to support industry users in completing their submissions electronically using CEDRI.'' The commenter also noted the EPA found that ''over 3,400 ERT files have been submitted to the EPA through CEDRI,'' only 43 help calls were received, and only 9 calls were referred to EPA staff for further assistance (see, NESHAP: Petroleum Refinery Sector Amendments, Proposal, 83 FR 15458, 15469 (April 10, 2018). The commenter said the EPA's proposed extension was not based on evidence of any problem with electronic reporting in the past, based on the record provided for public comment. The commenter said that no evidence was provided showing that a reporting problem could not be resolved through a case-by-case resolution or that any harm has been caused by not having an extension provision.

The commenter was concerned that delayed reporting and potentially failure to report would cause harm because it delays compliance assurance by the EPA, the states, and affected community residents. The commenter thought the extension provision would undermine the health and environmental protections of the standards, resulting in cancer and acute health threats from engine test facilities. The commenter urged the EPA to set a deadline for reporting and to assure that the extension request allows only a temporary delay in reporting, such as a 10-day extension, rather than an open-ended extension with no deadline.

Response: The EPA disagrees with these comments. The final rule requires electronic reporting for all facilities subject 40 CFR part 63, to subpart PPPPP as proposed. The commenter questioned the limited flexibility the EPA proposed (and is finalizing), namely inclusion of electronic reporting provisions for reporters facing circumstances beyond their control. The commenter asserts the case-by-case extension of report submittal deadlines is an ''unlawful exemption [from compliance with] the emissions standards.'' This is not the case, as explained below. The proposed provisions the commenter questions are as follows (emphasis added):

(3) If you are required to electronically submit a report through CEDRI in the EPA's CDX, and due to a planned or actual outage of either the EPA's CEDRI or CDX systems within the period of time beginning 5 business days prior to the date that the submission is due, you will be or are precluded from accessing CEDRI or CDX and submitting a required report within the time prescribed, you may assert a claim of EPA system outage for failure to timely comply with the reporting requirement. You must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or caused a delay in reporting. *You must provide to the Administrator a written description identifying the date, time and length of the outage; a rationale for attributing the delay in reporting beyond the regulatory deadline to the EPA system outage; describe the measures taken or to be taken to minimize the delay in reporting; and identify a date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported. In any circumstance, the report must be submitted electronically as soon as possible after the outage is resolved.* The decision to accept the claim of EPA system outage and allow an extension to the reporting deadline is solely within the discretion of the Administrator.

(4) If you are required to electronically submit a report through CEDRI in the EPA's CDX and a force majeure event is about to occur, occurs, or has occurred or there are lingering effects from such an event within the period of time beginning 5 business days prior to the date the submission is due, the owner or operator may assert a claim of force majeure for failure to timely comply with the reporting requirement. For the purposes of this section, a force majeure event is defined as an event that will be or has been caused by circumstances beyond the control of the affected facility, its contractors, or any entity controlled by the affected facility that prevents you from complying with the requirement to submit a report electronically within the time period prescribed. Examples of such events are acts of nature (*e.g.,* hurricanes, earthquakes, or floods), acts of war or terrorism, or equipment failure or safety hazard beyond the control of the affected facility (*e.g.,* large scale power outage). *If you intend to assert a claim of force majeure, you must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or caused a delay in reporting. You must provide to the Administrator a written description of the force majeure event and a rationale for attributing the delay in reporting beyond the regulatory deadline to the force majeure event; describe the measures taken or to be taken to minimize the delay in reporting; and identify a date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported. In any circumstance, the reporting must occur as soon as possible after the force majeure event occurs.* The decision to accept the claim of force majeure and allow an extension to the reporting deadline is solely within the discretion of the Administrator.

There is no exception or exemption to reporting, much less an exemption from compliance with the numerical emission standards, rather, this regulatory provision only sets out a method for requesting an extension of the reporting deadline. Reporters are required to justify their request and identify a reporting date. There is no predetermined timeframe for the length of extension that can be granted, as this is something best determined by the Administrator (*i.e.,* the EPA Administrator or delegated authority as defined in 40 CFR 63.2) when reviewing the circumstances surrounding the request. Different circumstances may require a different length of extension for electronic reporting. For example, a tropical storm may delay electronic reporting for a day, but a Hurricane Katrina scale event may delay electronic reporting for much longer, especially if the facility has no power, and, as such, the owner or operator has no ability to either access electronically stored data or to submit reports electronically. The Administrator (or delegated authority)

will be the most knowledgeable of the events leading to the request for extension and will assess whether an extension is appropriate, and, if so, a reasonable length for the extension. The Administrator (or delegated authority) may even request that the report be sent in hardcopy until electronic reporting can be resumed. While no new fixed duration deadline is set, the regulation requires that the report be submitted electronically as soon as possible after the CEDRI outage or after the force majeure event resolves.

The concept of force majeure is not arbitrary, as it has been implemented since May 2007 within the CAA requirements through the performance test extensions requirements provided in 40 CFR 63.7(a)(4) and 60.8(a)(1). Like the performance test extensions, the approval of a requested extension of an electronic reporting deadline is at the discretion of the Administrator.

The EPA disagrees that the reporting extension will undermine enforcement because the Administrator has full discretion to accept or reject the claim of a CEDRI system outage or force majeure. As such, an extension is not automatic and is agreed to on an individual basis by the Administrator. If the Administrator determines that a facility has not acted in good faith to reasonably report in a timely manner, the Administrator can reject the claim and find that the failure to report timely is a deviation from the regulation. CEDRI system outages are infrequent, but the EPA knows when they occur and whether a facility's claim is legitimate. Force majeure events (*e.g.,* natural disasters impacting a facility) are also usually well-known events.

Additionally, the ability to request a reporting extension does not apply to a broad category of circumstances; on the contrary, the scope for submitting an extension request for an electronic report is very limited in that claims can only be made for an event outside of the owner's or operator's control that occurs in the 5 business days prior to the reporting deadline. The claim must then be approved by the Administrator, and in approving such a claim, the Administrator would agree that something outside the control of the owner or operator prevented the owner or operator from meeting its reporting obligation. In no circumstance does this electronic reporting extension allow for the owner or operator to be out of compliance with the underlying emissions standards.

The EPA disagrees with the commenter's assumption that the requirement to report ''as soon as possible'' makes it likely that reporting will be significantly delayed, may lead a facility to drag its feet in submitting reports for an extended period, or may lead to a facility never reporting information. Each request for an extension of the electronic reporting deadline must be approved by the Administrator (or delegated authority), and each request must state the time requested for the extension as well as the dates and times at which the unsuccessful attempt(s) to access CEDRI were made in the case of a CEDRI outage. The EPA also disagrees that a delay in reporting due to a CEDRI outage or a force majeure event would necessitate a delay in a corrective action that would be taken to prevent harmful and unlawful emission exceedances. The facility must remain in compliance with all air emissions requirements and has an ongoing responsibility under the general duty clause of 40 CFR 63.6(e) to operate and maintain any affected source in a manner consistent with safety and good air pollution practices for minimizing emissions. An extension of the deadline for submitting an electronic report in no way eliminates culpability for exceedances of emissions limitations or the requirement to address them.

The EPA disagrees that the force majeure extension request must require a facility to report what steps it will take in the future to prevent the same problem from occurring. A force majeure event for the purpose of electronic reporting is defined as ''. . . an event that will be or has been caused by circumstances beyond the control of the affected facility, its contractors, or any entity controlled by the affected facility.'' Examples of such events are acts of nature and acts of war or terrorism. By definition, force majeure events are not something that a facility is able to control, and, thus, there is no way for the facility to prevent it from happening.

The EPA disagrees that the existing statistics on the use of CEDRI and e-reporting precludes the need for a provision to account for an outage of the CEDRI system. Prudent management of electronic data systems builds in allowances for unexpected, non-routine delays, such as occurred on July 1, 2016, and October 20–23, 2017, and is consistent with the already-existing provisions afforded for unexpected, non-routine delays in performance testing (see 40 CFR 60.8(a)(1) and (2) and 40 CFR 63.7(a)(4)). For both electronic reporting and performance testing, owners or operators are to conduct and complete their activities within a short window of time; the EPA believes that it is prudent to allow owners or operators to make force majeure claims for situations beyond their reasonable control. The EPA also disagrees that incidental issues with questions on completing the form or the procedures for accessing CEDRI for which the CEDRI Helpdesk is available, are conditions that would be considered either force majeure or a CEDRI system outage. The existence of the Helpdesk for answering questions on procedures in submitting reports to CEDRI have no impact on the availability of CEDRI in such a circumstance.

The purpose of these requests for extensions are to accommodate owners and operators in cases where they cannot successfully submit a report electronically for reasons that are beyond their control and occur during a short window of time prior to the reporting deadline. The extension is not automatic, and the Administrator retains the right to accept or reject the request. The language was added as part of the standard electronic reporting language based on numerous comments received on the proposal for the Electronic Reporting and Recordkeeping Requirements for the New Source Performance Standards (80 FR 15100, March 20, 2015).

Additional comments and our specific responses can be found in the comment summary and response document titled *Summary of Public Comments and Responses for the Residual Risk and Technology Review for Engine Test Cells/Stands,* which is available in the docket for this action.

4. What is the rationale for our final approach for the electronic reporting provisions?

The EPA evaluated all of the comments on the EPA's proposed amendments to the electronic reporting provisions. For the reasons explained in the proposed rule (84 FR 20208, May 8, 2019), we have determined the electronic submittal of the reports addressed in this final rule will increase the usefulness of the data contained in those reports, is in keeping with current trends in data availability and transparency, will further assist in the protection of public health and the environment, will improve compliance by facilitating the ability of regulated facilities to demonstrate compliance with requirements and by facilitating the ability of delegated state, local, tribal, and territorial air agencies and the EPA to assess and determine compliance, and will ultimately reduce burden on regulated facilities, delegated air agencies, and the EPA. Electronic reporting also eliminates paper-based, manual processes, thereby saving time

and resources, simplifying data entry, eliminating redundancies, minimizing data reporting errors, and providing data quickly and accurately to the affected facilities, air agencies, the EPA, and the public. Moreover, electronic reporting is consistent with the EPA's plan [6] to implement Executive Order 13563 and is in keeping with the EPA's Agency-wide policy [7] developed in response to the White House's Digital Government Strategy.[8] For more information on the benefits of electronic reporting, see the memorandum, *Electronic Reporting Requirements for New Source Performance Standards (NSPS) and National Emission Standards for Hazardous Air Pollutants (NESHAP),* available in Docket ID No. EPA–HQ–OAR–2018–0753.

E. Technical and Editorial Changes for the Engine Test Cells/Stands Source Category

1. What did we propose for the Engine Test Cells/Stands source category?

The EPA proposed the following technical and editorial changes to the existing NESHAP for the source category:

- Revising the monitoring requirements in 40 CFR 63.9307 to add THC as a continuous emission monitoring option and to add Performance Specification 8A and EPA Method 25A;
- Revising the initial compliance requirements in 40 CFR 63.9320 to include a provision for the performance test to be used to demonstrate compliance;
- Revising Tables 3 and 4 to 40 CFR part 63, subpart PPPPP, to add an alternative compliance option; and
- Revising section 40 CFR 63.9350 to address the reporting of performance tests and performance evaluations.

2. How did the technical and editorial changes change for the Engine Test Cells/Stands source category?

Since proposal, the technical and editorial changes have not changed.

3. What key comments did we receive on the technical and editorial changes, and what are our responses?

While no comments were received on the particular technical and editorial changes detailed above, additional comments of a technical and editorial nature were received. Our specific responses to those comments can be found in the document titled *Summary of Public Comments and Responses for the Residual Risk and Technology Review for Engine Test Cells/Stands,* which is available in the docket for this action.

4. What is the rationale for our final approach for the technical and editorial changes?

Because no comments were received on the technical and editorial changes that the EPA proposed, we determined that these changes should be finalized as proposed.

F. Additional Issue on Which Comment Was Requested: Prior Approval for an Aspect of Performance Testing

1. What did we propose for the Engine Test Cells/Stands source category?

In the proposal, the EPA specifically solicited comment on an aspect of initial performance testing. According to the existing regulations, if an affected source owner or operator elects to comply with the percent reduction emission limitation, an initial performance test must be conducted to determine the capture and control efficiencies of the equipment and to establish the operating limits to be achieved on a continuous basis. Performance tests are to be conducted under representative operating conditions, and the source is required to document the operating conditions during the test and explain why the conditions represent normal operation. In discussions prior to our May 2019 proposal, industry stakeholders raised the issue that, for facilities with multiple test cells/stands, it is difficult to define ''normal'' operation due to the several types of engine tests conducted, the varying operation conditions for the engine tests, the number of cells/stands, different kinds of test fuels, and the complex emission capture system. Thus, affected sources have felt the need to request approval on the testing protocol prior to conducting the performance tests to limit tests to representative cells. We requested comment on whether this process of requesting prior approval for determining what is considered ''normal'' operation for a specific affected facility is reasonable and appropriate for the one-time required performance test. More information concerning our request for comment on this aspect of initial performance testing can be found in the proposed rule (84 FR 20208, May 8, 2019).

2. How did the performance testing issue change for the Engine Test Cells/Stands source category?

Since proposal, this issue has not changed.

3. What key comments did we receive on the performance testing issue, and what are our responses?

One commenter commented more broadly on the issue of performance testing.

Comment: One commenter recommended that the EPA streamline requirements calling for Agency approval of alternate testing protocols and monitoring. The commenter said that this requirement creates unnecessary compliance complexity for facilities with multiple test cells and further stated that it was difficult to comply with this requirement when determining the capture efficiency for a cell that is not a permanent total enclosure (PTE), which is the case for cells in large complexes. The commenter said that in situations where there are temporary total enclosures (TTE), demonstrating TTE as defined by EPA Method 204 is challenging because of the size and set-up at a large facility (*e.g.,* approximately 90 cells). The gas-to-gas protocol, the commenter said, is not practical to implement due to the size and complexity of multiple cells within a large complex. The TTE requirements cannot be met as prescribed because:

- The test method requires the construction of a TTE over all of the test cells in order to measure emissions at exhaust points from the test cell building. With many cells and the volume of air flow involved, construction of a TTE is impossible because the temporary structure would be the size of a large building.
- Measuring all of the emission points from a test cell building at one location is not practical as this would require simultaneous testing at one location of exhaust volume and THC concentration from over 100 locations (90+ general ventilation exhaust points, scavenge air exhaust points systems, emission analyzer vents, and regenerative thermal oxidizers).
- The low CO volume generated from scavenge air and air handling units associated with the general ventilation system can be difficult to measure accurately and background CO levels can interfere with obtaining accurate

[8] *Digital Government: Building a 21st Century Platform to Better Serve the American People,* May 2012. Available at: *https://obamawhitehouse.archives.gov/sites/default/files/omb/egov/digital-government/digital-government.html.*

measurements for determining capture efficiency in testing TTE.

- Approval is needed to limit tests to ''representative'' cells. From a practical perspective, the absence of a definition of what is representative (*e.g.,* test type, common engine type, common fuel, CO measurement methods) results in delayed approvals from regulatory authorities as there is no defined basis for approval.
- Other TTE EPA Method 204 issues include:
  - A source must request alternative approval to deviate from EPA Method 204 requirements to use a single analyzer. The rule does not address the ability to use various calibration gases based on concentration ranges for several capture points.
  - Current rule excludes an allowance for measuring CO instead of VOC or THC, triggering the need for regulatory authority approval to measure CO. In most cases, VOC is too low of a concentration to measure from test cell operations.
  - When testing capture efficiency, an entity must lock room air handling system in place in order to accurately measure air flow from this source and generate valid data. This can trigger changes in ambient conditions for the engine test.

To address these issues, the commenter recommended the EPA should:

1. *Step 1:* Define 100-percent capture to exclude general ventilation, scavenge air systems, and test bench emissions. Based on testing experience and data, these sources represent less than 1 percent of the emissions.
   - Due to the size, number, and configuration of test cells, it is difficult to determine capture efficiency and meet the TTE requirements.
   - Alternatively, the EPA could establish a default capture rate for the *de minimis* emissions to avoid facilities having to undertake costly testing when the capture is known to be nearly complete.
2. *Step 2:* If a PTE cannot be met and the gas-to-gas protocol and TTE requirements are triggered:
   - Allow for a representative test and include a definition describing the requirements for representative test conditions in order to measure CO from various points from the enclosure. This would include testing a representative test cycle (*e.g.,* durability) on a single common engine/fuel type.
   - Modify requirements to allow for multiple analyzers with different measurement spans.
   - If testing of capture efficiency must be conducted, the test method should allow for the locking of the room air handling system. This is not considered normal operation but is necessary because facilities cannot accurately measure air flow when the system is in a constant state of adjusting.
   - Allow measurement of CO, not just THC or HAP.

Response: The EPA is not amending the test procedures and protocols required by this subpart at this time. The EPA also notes that the ability to use either alternative methods or deviations of methods may be pursued on a case by case basis through the site-specific test plan and the alternative method procedures of 40 CFR 63.7(e)(2). Sources may also request approval of a broadly applicable alternative test method through the EPA Measurement Technology Group.

4. What is the rationale for our final approach for the performance testing issue?

The EPA evaluated all of the comments on the EPA's proposed changes regarding initial performance testing. For the reasons explained previously, we determined that no changes should be made to current practice. Although affected sources may still request approval on the testing protocol, this practice will continue to not be required.

V. Summary of Cost, Environmental, and Economic Impacts and Additional Analyses Conducted

A. What are the affected facilities?

There are currently 59 engine test cells/stands facilities operating in the United States that conduct engine testing operations and are subject to the Engine Test Cells/Stands NESHAP. The 40 CFR part 63, subpart PPPPP, affected source is the collection of all equipment and activities associated with engine test cells/stands used for testing uninstalled stationary or uninstalled mobile engines located at a major source of HAP emissions. A new or reconstructed affected source is a completely new engine testing source that commenced construction after May 14, 2002, or meets the definition of reconstruction and commenced reconstruction after May 14, 2002.

B. What are the air quality impacts?

At the current level of control, emissions of total HAP from the source category are estimated to be approximately 163 tpy. This represents a reduction in HAP emissions of about 80 tpy due to the current (2003) Engine Test Cells/Stands NESHAP. These final amendments require all affected sources subject to the emission standards in the Engine Test Cells/Stands NESHAP to operate without the SSM exemption. We do not expect that eliminating the SSM exemption will result in reduced emissions since the existing NESHAP requires that the operating limits established during the performance test for demonstrating continuous compliance must be met at all times.

Indirect or secondary air emissions impacts are impacts that would result from the increased electricity usage associated with the operation of control devices (*i.e.,* increased secondary emissions of criteria pollutants from power plants). Energy impacts consist of the electricity and steam needed to operate control devices and other equipment. The EPA expects no secondary air emissions impacts or energy impacts from this rulemaking.

C. What are the cost impacts?

The EPA estimates that each facility in the source category will experience costs as a result of the final amendments. These costs are estimated as part of the reporting and recordkeeping costs of the final rule. Each facility will experience costs to read and understand the rule amendments. The total cost for this activity is estimated to be $4,029 annually, inclusive of all affected entities. Facilities will also experience costs associated with the elimination of the SSM exemption (including labor hours required for re-evaluation of previously developed SSM record systems), and costs associated with the requirement to electronically submit performance test, performance evaluation, and semi-annual compliance reports using CEDRI (including labor hours needed to become familiar with CEDRI and the reporting template for semi-annual compliance reports). There costs were also estimated as part of the reporting and recordkeeping costs of the rule amendments, however, we do not expect any net change in cost to result from elimination of the SSM exemption or the addition of the electronic reporting requirements. Therefore, the total estimated cost of this action, beyond the costs that would have been incurred by industry pursuant to the regulations in effect prior to this final rule, is $4,029 annually.

D. What are the economic impacts?

Economic impact analyses focus on changes in market prices and output levels. If changes in market prices and output levels in the primary markets are significant enough, impacts on other markets may also be examined. Both the magnitude of costs associated with a

rule and the distribution of those costs among affected facilities can have a role in determining how the market will change in response to the rule. As presented in section VI.C of this preamble, the total estimated cost of this final rule is approximately $4,029 annually. These costs are not expected to result in a significant market impact, regardless of whether they are passed on to the purchaser or absorbed by the firms.

E. What are the benefits?

The EPA is not finalizing changes to the emission limit requirements and estimates the proposed changes to SSM, recordkeeping, reporting, and monitoring are not economically significant. Because these final amendments are not considered economically significant, as defined by Executive Order 12866, and because no emission reductions were estimated, we did not estimate any benefits from reducing emissions.

F. What analysis of environmental justice did we conduct?

Executive Order 12898 (59 FR 7629, February 16, 1994) establishes federal executive policy on environmental justice. Its main provision directs federal agencies, to the greatest extent practicable and permitted by law, to make environmental justice part of their mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority populations and low-income populations in the United States.

To examine the potential for any environmental justice issues that might be associated with the source category, the EPA performed a demographic analysis, which is an assessment of risks to individual demographic groups of the populations living within 5 kilometers (km) and within 50 km of the facilities. In the analysis, we evaluated the distribution of HAP-related cancer and noncancer risks from the Engine Test Cells/Stands source category across different demographic groups within the populations living near facilities.[9]

The results of the demographic analysis are summarized in Table 3 below. These results, for various demographic groups, are based on the estimated risk from actual emissions levels for the population living within 50 km of the facilities.

TABLE 3—ENGINE TEST CELLS/STANDS DEMOGRAPHIC RISK ANALYSIS RESULTS

[Engine Test Cells/Stands source category: Demographic assessment results—50 km study area radius]

		Population with cancer risk greater than or equal to 1 in 1 million	Population with HI greater than 1
	Nationwide	Source category	
Total Population	317,746,049	2,745	0
	White and minority by percent		
White	62	90	0
Minority	38	10	0
	Minority by percent		
African American	12	3	0
Native American	0.8	0.4	0
Hispanic or Latino (includes white and nonwhite)	18	2	0
Other and Multiracial	7	4	0
	Income by percent		
Below Poverty Level	14	13	0
Above Poverty Level	86	87	0
	Education by percent		
Over 25 and without a High School Diploma	14	9	0
Over 25 and with a High School Diploma	86	91	0
	Linguistically isolated by percent		
Linguistically Isolated	6	2	0

The results of the Engine Test Cells/Stands source category demographic analysis indicate that emissions from the source category expose approximately 2,700 people to a cancer risk at or above 1-in-1 million and no people to a chronic noncancer TOSHI greater than 1 based on actual or allowable emissions. Regarding cancer risk, the specific demographic results indicate that the percentage of the population potentially impacted by engine test cells/stands emissions is greater than its corresponding nationwide percentage for the following demographics: White (90 percent for the source category compared to 62 percent nationwide), Above Poverty Level (87

[9] Demographic groups included in the analysis are: White, African American, Native American, other races and multiracial, Hispanic or Latino, children 17 years of age and under, adults 18 to 64 years of age, adults 65 years of age and over, adults without a high school diploma, people living below the poverty level, people living two times the poverty level, and linguistically isolated people.

percent for the source category compared to 86 percent nationwide), and Over 25 and with a High School Diploma (91 percent for the source category compared to 86 percent nationwide). The remaining demographic group percentages (including the groups explicitly designated as minority) are the same or less than the corresponding nationwide percentages.

The EPA, therefore, reaffirms its determination that this final rule will not have disproportionately high and adverse human health or environmental effects on minority, low income, or indigenous populations because it maintains the level of environmental protection for all affected populations without having any disproportionately high and adverse human health or environmental effects on any population, including any minority, low income, or indigenous populations.

The methodology and the results of the demographic analysis are presented in a technical report, *Risk and Technology Review Analysis of Demographic Factors for Populations Living Near Engine Test Cells/Stands Source Category Operations,* available in the docket for this action.

G. What analysis of children's environmental health did we conduct?

The EPA does not believe the environmental health or safety risks addressed by this action present a disproportionate risk to children. This action's health and risk assessments are contained in the document, *Residual Risk Assessment for the Engine Test Cells/Stands Source Category in Support of the 2020 Risk and Technology Review Final Rule,* which is available in the docket for this action.

VI. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at *https://www.epa.gov/laws-regulations/laws-and-executive-orders.*

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is not a significant regulatory action and was, therefore, not submitted to the Office of Management and Budget (OMB) for review.

B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs

This action is not an Executive Order 13771 regulatory action because this action is not significant under Executive Order 12866.

C. Paperwork Reduction Act (PRA)

The information collection activities in this rule have been submitted for approval to the Office of Management and Budget (OMB) under the PRA. The Information Collection Request (ICR) document that the EPA prepared has been assigned EPA ICR number 2066.09. You can find a copy of the ICR in the docket for this rule, and it is briefly summarized here. The information collection requirements are not enforceable until OMB approves them.

We are finalizing changes to the reporting and recordkeeping requirements for the Engine Test Cells/Stands NESHAP in the form of eliminating the SSM reporting and SSM plan requirements and requiring electronic submittal of all compliance reports (including performance test reports). Any information submitted to the Agency for which a claim of confidentiality is made will be safeguarded according to the Agency policies set forth in title 40, chapter 1, part 2, subpart B—Confidentiality of Business Information (see 40 CFR part 2; 41 FR 36902, September 1, 1976; amended by 43 FR 40000, September 8, 1978; 43 FR 42251, September 20, 1978; 44 FR 17674, March 23, 1979).

Respondents/affected entities: Respondents are owners or operators of engine test cells/stands facilities subject to the Engine Test Cells/Standards NESHAP.

Respondent's obligation to respond: Mandatory (40 CFR part 63, subpart PPPPP).

Estimated number of respondents: On average, over the next 3 years, approximately 12 existing major sources will be subject to these standards, of which seven are subject to emission limits, monitoring, recordkeeping, and reporting requirements. It is also estimated that one additional respondent will become subject to the emission standards over the 3-year period and two additional respondents will be subject only to the notification requirements.

Frequency of response: On average, this collection is expected to produce 18 responses per year.

Total estimated burden: 1,000 hours (per year). Burden is defined at 5 CFR 1320.3(b).

Total estimated cost: $4,029 (per year), which is inclusive of the cost of familiarization with regulatory requirements, plus $2,900 annualized capital or operation and maintenance costs. An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations in 40 CFR are listed in 40 CFR part 9. When OMB approves this ICR, the Agency will announce that approval in the **Federal Register** and publish a technical amendment to 40 CFR part 9 to display the OMB control number for the approved information collection activities contained in this final rule.

D. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. In making this determination, the impact of concern is any significant adverse economic impact on small entities. During the original rulemaking, an ICR was sent to over 100 companies representing over 300 individual facilities. Using that information, along with discussion with industry stakeholders, it was determined that there were no major sources that were also owned by small entities. A review of the 59 facilities currently in this source category also concluded that none are owned by small entities. Thus, this action will not impose any requirements on small entities.

E. Unfunded Mandates Reform Act (UMRA)

This action does not contain any unfunded mandate as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. The action imposes no enforceable duty on any state, local, or tribal governments or the private sector.

F. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications as specified in Executive Order 13175. The EPA does not know of any engine test cell/stand facilities owned or operated by Indian tribal governments. Thus, Executive Order 13175 does not apply to this action.

H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

This action is not subject to Executive Order 13045 because it is not economically significant as defined in Executive Order 12866, and because the EPA does not believe the environmental health or safety risks addressed by this action present a disproportionate risk to children. This action's health and risk assessments are contained in sections III and IV of the proposal preamble (84 FR 20208, May 8, 2019) and further documented in the risk report titled *Residual Risk Assessment for the Engine Test Cells/Stands Source Category in Support of the 2020 Risk and Technology Review Final Rule,* which is available in the docket for this action.

I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This action is not subject to Executive Order 13211, because it is not a significant regulatory action under Executive Order 12866.

J. National Technology Transfer and Advancement Act (NTTAA)

This rulemaking does not involve technical standards.

K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes that this action does not have disproportionately high and adverse human health or environmental effects on minority populations, low-income populations, and/or indigenous peoples, as specified in Executive Order 12898 (59 FR 7629, February 16, 1994).

The documentation for this decision is contained in section IV.B of the proposal preamble (84 FR 20208, May 8, 2019), section IV.A of this preamble, and the technical report, *Risk and Technology Review Analysis of Demographic Factors for Populations Living Near Engine Test Cells/Stands Source Category Operations,* which is available in the docket for this rulemaking.

L. Congressional Review Act (CRA)

This action is subject to the CRA, and the EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action is not a ''major rule'' as defined by 5 U.S.C. 804(2).

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedures, Air pollution control, Engine test cells/stands, Hazardous substances, Incorporation by reference, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: March 11, 2020.

Andrew R. Wheeler,

Administrator.

For the reasons set forth in the preamble, 40 CFR part 63 is amended as follows:

PART 63—NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart PPPPP—National Emission Standards for Hazardous Air Pollutants for Engine Test Cells/Stands

■ 2. Section 63.9295 is amended by revising paragraph (a) to read as follows:

§ 63.9295 When do I have to comply with this subpart?

(a) *Affected sources.* (1) If you start up your new or reconstructed affected source before May 27, 2003, you must comply with the emission limitations in this subpart no later than May 27, 2003; except that the compliance date for the requirements promulgated at §§ 63.9295, 63.9305, 63.9340, 63.9350, 63.9355, 63.9375, and Table 7 of 40 CFR part 63, subpart PPPPP, revised on June 3, 2020 is December 1, 2020.

(2) If you start up your new or reconstructed affected source on or after May 27, 2003, you must comply with the emission limitations in this subpart upon startup; except that if the initial startup of your new or reconstructed affected source occurs after May 27, 2003, but on or before May 8, 2019, the compliance date for the requirements promulgated at §§ 63.9295, 63.9305, 63.9340, 63.9350, 63.9355, 63.9375, and Table 7 of this subpart as revised on June 3, 2020 is December 1, 2020.

(3) If the initial startup of your new or reconstructed affected source occurs after May 8, 2019, the compliance date is June 3, 2020 or the date of startup, whichever is later.

* * * * *

■ 3. Section 63.9305 is revised to read as follows:

§ 63.9305 What are my general requirements for complying with this subpart?

(a) Prior to December 1, 2020, you must be in compliance with the emission limitation that applies to you at all times, except during periods of startup, shutdown, or malfunction (SSM) of your control device or associated monitoring equipment. On and after December 1, 2020, you must be in compliance with the applicable emission limitation at all times.

(b) If you must comply with the emission limitation, you must operate and maintain your engine test cell/stand, air pollution control equipment, and monitoring equipment in a manner consistent with safety and good air pollution control practices for minimizing emissions at all times. The general duty to minimize emissions does not require the owner or operator to make any further efforts to reduce emissions if levels required by the applicable standard have been achieved. Determination of whether a source is operating in compliance with operation and maintenance requirements will be based on information available to the Administrator that may include, but is not limited to, monitoring results, review of operation and maintenance procedures, review of operation and maintenance records, and inspection of the affected source.

(c) For affected sources prior to December 1, 2020, you must develop a written SSM plan (SSMP) for emission control devices and associated monitoring equipment according to the provisions in § 63.6(e)(3). The plan will apply only to emission control devices, and not to engine test cells/stands.

■ 4. Section 63.9307 is amended by revising paragraphs (c)(1), (2), and (4) to read as follows:

§ 63.9307 What are my continuous emissions monitoring system installation, operation, and maintenance requirements?

* * * * *

(c) * * *

(1) You must install, operate, and maintain each CEMS according to the applicable Performance Specification (PS) of 40 CFR part 60, appendix B (PS–3, PS–4A, or PS–8).

(2) You must conduct a performance evaluation of each CEMS according to the requirements in 40 CFR 63.8 and according to PS–3 of 40 CFR part 60, appendix B, using Reference Method 3A or 3B for the O_2 CEMS, and according to PS–4A of 40 CFR part 60, appendix B, using Reference Method 10 or 10B for the CO CEMS, and according to PS–8 of CFR part 60, appendix B, using Reference Method 25A for the THC CEMS. If the fuel used in the engines being tested is natural gas, you may use ASTM D 6522–00, Standard Test Method for Determination of Nitrogen Oxides, Carbon Monoxide and Oxygen Concentrations in Emissions from

Natural Gas Fired Reciprocating Engines, Combustion Turbines, Boilers, and Process Heaters Using Portable Analyzers (incorporated by reference, see § 63.14). As an alternative to Method 3B, you may use ANSI/ASME PTC 19.10–1981, ''Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus],'' (incorporated by reference, see § 63.14).

* * * * *

(4) All CEMS data must be reduced as specified in § 63.8(g)(2) and recorded as CO or THC as carbon concentration in parts per million by volume, dry basis (ppmvd), corrected to 15 percent O_2 content.

* * * * *

■ 5. Section 63.9320 is amended by revising paragraphs (b) and (c) to read as follows:

§ 63.9320 What procedures must I use?

* * * * *

(b) You must conduct an initial performance evaluation of each capture and control system according to §§ 63.9321, 63.9322, 63.9323 and 63.9324, and each CEMS according to the requirements in 40 CFR 63.8 and according to the applicable Performance Specification of 40 CFR part 60, appendix B (PS–3, PS–4A, or PS–8).

(c) The initial demonstration of compliance with the carbon monoxide (CO) or THC concentration limitation consists of either the first 4-hour rolling average CO or THC concentration recorded after completion of the CEMS performance evaluation if CEMS are installed or the average of the test run averages during the initial performance test. You must correct the CO or THC concentration at the outlet of the engine test cell/stand or the emission control device to a dry basis and to 15 percent O_2 content according to Equation 1 of this section:

$$C_c = C_{unc} \left[\frac{5.9}{(20.9 - \%O2d)}\right]$$

Where:

C_c = concentration of CO or THC, corrected to 15 percent oxygen, ppmvd

C_{unc} = total uncorrected concentration of CO or THC, ppmvd

$\%O_{2d}$ = concentration of oxygen measured in gas stream, dry basis, percent by volume

* * * * *

■ 6. Section 63.9321 is amended by revising paragraph (a) introductory text to read as follows:

§ 63.9321 What are the general requirements for performance tests?

(a) You must conduct each performance test required by § 63.9310 under the conditions in this section unless you obtain a waiver of the performance test according to the provisions in § 63.7(h). Prior to December 1, 2020, the performance test must also be conducted according to the requirements in § 63.7(e)(1).

* * * * *

■ 7. Section 63.9330 is amended by revising paragraph (a) to read as follows:

§ 63.9330 How do I demonstrate initial compliance with the emission limitation?

(a) You must demonstrate initial compliance with the emission limitation that applies to you according to Table 4 to this subpart.

* * * * *

■ 8. Section 63.9340 is amended by revising paragraph (c) to read as follows:

§ 63.9340 How do I demonstrate continuous compliance with the emission limitations?

* * * * *

(c) Startups, shutdowns, and malfunctions:

(1) For affected sources prior to December 1, 2020, consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of SSM of control devices and associated monitoring equipment are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1).

(2) The Administrator will determine whether deviations that occur during a period you identify as an SSM of control devices and associated monitoring equipment are violations, according to the provisions in § 63.6(e).

■ 9. Section 63.9350 is amended by:
■ a. Revising paragraph (a)(6) and;
■ b. Adding paragraph (a)(7);
■ c. Revising paragraph (c) introductory text;
■ d. Adding paragraph (c)(5);
■ e. Revising paragraph (d) introductory text;
■ f. Adding paragraph (d)(11);
■ g. Revising paragraph (e); and
■ h. Adding paragraphs (f) through (i).

The revisions and additions read as follows:

§ 63.9350 What reports must I submit and when?

(a) * * *

(6) For affected sources prior to December 1, 2020, if you had an SSM of a control device or associated monitoring equipment during the reporting period and you took actions consistent with your SSMP, the compliance report must include the information in paragraphs § 63.10(d)(5)(i).

(7) Beginning on December 1, 2020, submit all semiannual compliance reports following the procedure specified in paragraph (g) of this section.

* * * * *

(c) For each deviation from an emission limit, the semiannual compliance report must include the information in paragraphs (b)(1) through (3) of this section and the information included in paragraphs (c)(1) through (4) of this section, except that on and after December 1, 2020 the semiannual compliance report must also include the information included in paragraph (c)(5) of this section.

* * * * *

(5) An estimate of the quantity of each regulated pollutant emitted over any emission limit, and a description of the method used to estimate the emissions.

(d) For each CEMS or CPMS deviation, the semiannual compliance report must include the information in paragraphs (b)(1) through (3) of this section and the information included in paragraphs (d)(1) through (10) of this section, except that on and after December 1, 2020, the semiannual compliance report must also include the information included in paragraph (d)(11) of this section.

* * * * *

(11) The total operating time of each new or reconstructed engine test cell/stand during the reporting period.

(e) Prior to December 1, 2020, if you had an SSM of a control device or associated monitoring equipment during the semiannual reporting period that was not consistent with your SSMP, you must submit an immediate SSM report according to the requirements in § 63.10(d)(5)(ii).

(f) Within 60 days after the date of completing each performance test or performance evaluation required by this subpart, you must submit the results of the performance test following the procedures specified in paragraphs (f)(1) through (3) of this section.

(1) Data collected or performance evaluations of CMS measuring relative accuracy test audit (RATA) pollutants using test methods supported by the EPA's Electronic Reporting Tool (ERT) as listed on the EPA's ERT website (*https://www.epa.gov/electronic-reporting-air-emissions/electronic-reporting-tool-ert*) at the time of the test. Submit the results of the performance test or performance evaluation to the EPA via the Compliance and Emissions Data Reporting Interface (CEDRI), which can be accessed through the EPA's Central Data Exchange (CDX) (*https://cdx.epa.gov/*). The data must be submitted in a file format generated through the use of the EPA's ERT.

Alternatively, you may submit an electronic file consistent with the extensible markup language (XML) schema listed on the EPA's ERT website.

(2) Data collected or performance evaluations of CMS measuring RATA pollutants using test methods that are not supported by the EPA's ERT as listed on the EPA's ERT website at the time of the test. The results of the performance test or performance evaluation must be included as an attachment in the ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT website. Submit the ERT generated package or alternative file to the EPA via CEDRI.

(3) If you claim some of the information submitted under paragraph (f) of this section is CBI, you must submit a complete file, including information claimed to be CBI, to the EPA. The file must be generated through the use of the EPA's ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT website. Submit the file on a compact disc, flash drive, or other commonly used electronic storage medium and clearly mark the medium as CBI. Mail the electronic medium to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404–02, 4930 Old Page Rd., Durham, NC 27703. The same file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described in paragraph (f)(1) of this section.

(g) If you are required to submit reports following the procedure specified in this paragraph, you must submit reports to the EPA via CEDRI, which can be accessed through the EPA's CDX (*https://cdx.epa.gov/*). You must use the appropriate electronic report template on the CEDRI website (*https://www.epa.gov/electronic-reporting-air-emissions/compliance-and-emissions-data-reporting-interface-cedri*) for this subpart. The report must be submitted by the deadline specified in this subpart, regardless of the method in which the report is submitted. If you claim some of the information required to be submitted via CEDRI is CBI, submit a complete report, including information claimed to be CBI, to the EPA. The report must be generated using the appropriate form on the CEDRI website. Submit the file on a compact disc, flash drive, or other commonly used electronic storage medium and clearly mark the medium as CBI. Mail the electronic medium to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404–02, 4930 Old Page Rd., Durham, NC 27703. The same file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described earlier in this paragraph.

(h) If you are required to electronically submit a report through CEDRI in the EPA's CDX, you may assert a claim of EPA system outage for failure to timely comply with the reporting requirement. To assert a claim of EPA system outage, you must meet the requirements outlined in paragraphs (h)(1) through (7) of this section.

(1) You must have been or will be precluded from accessing CEDRI and submitting a required report within the time prescribed due to an outage of either the EPA's CEDRI or CDX systems.

(2) The outage must have occured within the period of time beginning five business days prior to the date that the submission is due.

(3) The outage may be planned or unplanned.

(4) You must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or has caused a delay in reporting.

(5) You must provide to the Administrator a written description identifying:

(i) The date(s) and time(s) when CDX or CEDRI was accessed and the system was unavailable;

(ii) A rationale for attributing the delay in reporting beyond the regulatory deadline to EPA system outage;

(iii) Measures taken or to be taken to minimize the delay in reporting; and

(iv) The date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported.

(6) The decision to accept the claim of EPA system outage and allow an extension to the reporting deadline is solely within the discretion of the Administrator.

(7) In any circumstance, the report must be submitted electronically as soon as possible after the outage is resolved.

(i) If you are required to electronically submit a report through CEDRI in the EPA's CDX, you may assert a claim of force majeure for failure to timely comply with the reporting requirement. To assert a claim of force majuere, you must meet the requirements outlined in paragraphs (i)(1) through (5) of this section.

(1) You may submit a claim if a force majeure event is about to occur, occurs, or has occurred or there are lingering effects from such an event within the period of time beginning five business days prior to the date the submission is due. For the purposes of this section, a force majeure event is defined as an event that will be or has been caused by circumstances beyond the control of the affected facility, its contractors, or any entity controlled by the affected facility that prevents you from complying with the requirement to submit a report electronically within the time period prescribed. Examples of such events are acts of nature (*e.g.,* hurricanes, earthquakes, or floods), acts of war or terrorism, or equipment failure or safety hazard beyond the control of the affected facility (*e.g.,* large scale power outage).

(2) You must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or has caused a delay in reporting.

(3) You must provide to the Administrator:

(i) A written description of the force majeure event;

(ii) A rationale for attributing the delay in reporting beyond the regulatory deadline to the force majeure event;

(iii) Measures taken or to be taken to minimize the delay in reporting; and

(iv) The date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported.

(4) The decision to accept the claim of force majeure and allow an extension to the reporting deadline is solely within the discretion of the Administrator.

(5) In any circumstance, the reporting must occur as soon as possible after the force majeure event occurs.

■ 10. Section 63.9355 is amended by:
■ a. Revising paragraphs (a) introductory text and (a)(3);
■ b. Adding paragraphs (a)(6) through (8);
■ c. Revising paragraphs (b)(2), (c) introductory text, and (c)(2) and (4); and
■ d. Adding paragraph (c)(5).

The revisions and additions read as follows:

§ 63.9355 What records must I keep?

(a) You must keep the records as described in paragraphs (a)(1) through (5) of this section. After June 3, 2020, you must also keep the records as described in paragraphs (a)(6) through (8) of this section.

* * * * *

(3) Records of the occurrence and duration of each malfunction of the air pollution control equipment, if applicable, as required in § 63.9355.

* * * * *

(6) In the event that an affected unit fails to meet an applicable standard,

record the number of failures. For each failure record the date, time, the cause, and duration of each failure.

(7) For each failure to meet an applicable standard, record and retain a list of the affected sources or equipment, an estimate of the quantity of each regulated pollutant emitted over any emission limit, and a description of the method used to estimate the emissions.

(8) Record actions taken to minimize emissions in accordance with § 63.9305, and any corrective actions taken to return the affected unit to its normal or usual manner of operation.

(b) * * *

(2) For affected sources prior to December 1, 2020, the records in § 63.6(e)(3)(iii) through (v) related to SSM.

* * * * *

(c) For each CEMS, you must keep the records as described in paragraph (c)(1) through (5) of this section.

* * * * *

(2) Previous (*i.e.,* superceded) versions of the performance evaluation plan as required in paragraph (c)(5) of this section.

* * * * *

(4) For affected sources prior to December 1, 2020, the records in § 63.6(e)(3)(iii) through (v) related to SSM of the control device and associated monitoring equipment.

(5) The owner or operator shall keep these written procedures on record for the life of the affected source or until the affected source is no longer subject to the provisions of this part, to be made available for inspection, upon request, by the Administrator. If the performance evaluation plan is revised, the owner or operator shall keep previous (*i.e.,* superseded) versions of the performance evaluation plan on record to be made available for inspection, upon request, by the Administrator, for a period of 5 years after each revision to the plan. The program of corrective action should be included in the plan required under § 63.8(d)(2).

* * * * *

■ 11. Section 63.9360 is amended by adding paragraph (d) to read as follows;

§ 63.9360 In what form and how long must I keep my records?

* * * * *

(d) Any records required to be maintained by this part that are submitted electronically via the EPA's CEDRI may be maintained in electronic format. This ability to maintain electronic copies does not affect the requirement for facilities to make records, data, and reports available upon request to a delegated air agency or the EPA as part of an on-site compliance evaluation.

■ 12. Section 63.9375 is amended in the definition of ''Deviation'' by revising paragraph (3) to read as follows:

§ 63.9375 What definitions apply to this subpart?

* * * * *

Deviation * * *

(3) Prior to December 1, 2020, fails to meet any emission limitation or operating limit in this subpart during malfunction, regardless of whether or not such failure is permitted by this subpart.

* * * * *

■ 13. Table 3 to subpart PPPPP is amended by revising the entry ''1. The CO or THC outlet concentration emission limitation'' to read as follows:

TABLE 3 TO SUBPART PPPPP OF PART 63—REQUIREMENTS FOR INITIAL COMPLIANCE DEMONSTRATIONS

*****

For each new or reconstructed affected source complying with . . .	You must . . .	Using . . .	According to the following requirements . . .
1. The CO or THC outlet concentration emission limitation.	a. Demonstrate CO or THC emissions are 20 ppmvd or less.	i. EPA Methods 3A and 10 of appendix A to 40 CFR part 60 for CO measurement or EPA Method 25A of appendix A to 40 CFR part 60 for THC measurement; or	You must demonstrate that the outlet concentration of CO or THC emissions from the test cell/stand or emission control device is 20 ppmvd or less, corrected to 15 percent O_2 content, using the average of the test runs in the performance test.
		ii. A CEMS for CO or THC and O_2 at the outlet of the engine test cell/stand or emission control device.	This demonstration is conducted immediately following a successful performance evaluation of the CEMS as required in § 63.9320 (b). The demonstration consists of the first 4-hour rolling average of measurements. The CO or THC concentration must be corrected to 15 percent O_2 content, dry basis using Equation 1 in § 63.9320.
*	*	*	* * * *

■ 14. Table 4 of subpart PPPPP is revised to read as follows:

TABLE 4 TO SUBPART PPPPP OF PART 63—INITIAL COMPLIANCE WITH EMISSION LIMITATIONS

[As stated in § 63.9330, you must demonstrate initial compliance with each emission limitation that applies to you according to the following table:]

For the . . .	You have demonstrated initial compliance if . . .
1. CO or THC concentration emission limitation.	The first 4-hour rolling average CO or THC concentration is 20 ppmvd or less, corrected to 15 percent O_2 content if CEMS are installed or the average of the test run averages during the performance test is 20 ppmvd or less, corrected to 15 percent O_2 content.
2. CO or THC percent reduction emission limitation.	The first 4-hour rolling average reduction in CO or THC is 96 percent or more, dry basis, corrected to 15 percent O_2 content.

■ 15. Table 5 of subpart PPPPP is revised to read as follows:

TABLE 5 TO SUBPART PPPPP OF PART 63—CONTINUOUS COMPLIANCE WITH EMISSION LIMITATIONS

[As stated in § 63.9340, you must demonstrate continuous compliance with each emission limitation that applies to you according to the following table:]

For the . . .	You must . . .	By . . .
1. CO or THC concentration emission limitation.	a. Demonstrate CO or THC emissions are 20 ppmvd or less over each 4- hour rolling averaging period.	i. Collecting the CPMS data according to § 63.9306(a), reducing the measurements to 1-hour averages used to calculate the 3-hr block average; or ii. Collecting the CEMS data according to § 63.9307(a), reducing the measurements to 1-hour averages, correcting them to 15 percent O_2 content, dry basis, according to § 63.9320.
2. CO or THC percent reduction emission limitation.	a. Demonstrate a reduction in CO or THC of 96 percent or more over each 4-hour rolling averaging period.	i. Collecting the CPMS data according to § 63.9306(a), reducing the measurements to 1-hour averages; or ii. Collecting the CEMS data according to § 63.9307(b), reducing the measurements to 1-hour averages, correcting them to 15 percent O_2 content, dry basis, calculating the CO or THC percent reduction according to § 63.9320.

■ 16. Table 7 of subpart PPPPP is revised to read as follows:

TABLE 7 TO SUBPART PPPPP OF PART 63—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART PPPPP

[As stated in 63.9365, you must comply with the General Provisions in §§ 63.1 through 15 that apply to you according to the following table:]

Citation	Subject	Applicable to subpart PPPPP	Explanation
§ 63.1(a)(1)–(12) ..	General Applicability	Yes.	
§ 63.1(b)(1)–(3)	Initial Applicability Determination	Yes	Applicability to subpart PPPPP is also specified in § 63.9285.
§ 63.1(c)(1)	Applicability After Standard Established	Yes.	
§ 63.1(c)(2)	Applicability of Permit Program for Area Sources.	No	Area sources are not subject to subpart PPPPP.
§ 63.1(c)(5)	Notifications	Yes.	
§ 63.1(d)	[Reserved].		
§ 63.1(e)	Applicability of Permit Program Before Relevant Standard is Set.	Yes.	
§ 63.2	Definitions	Yes	Additional definitions are specified in § 63.9375.
§ 63.3	Units and Abbreviations	Yes.	
§ 63.4	Prohibited Activities and Circumvention	Yes.	
§ 63.5(a)	Construction/Reconstruction	Yes.	
§ 63.5(b)	Requirements for Existing, Newly Constructed, and Reconstructed Sources.	Yes.	
§ 63.5(d)	Application for Approval of Construction/ Reconstruction.	Yes.	
§ 63.5(e)	Approval of Construction/Reconstruction ..	Yes.	
§ 63.5(f)	Approval of Construction/Reconstruction based on Prior State Review.	Yes.	
§ 63.6(a)	Compliance With Standards and Maintenance Requirements-Applicability.	Yes.	
§ 63.6(b)(1)–(7)	Compliance Dates for New and Reconstructed Sources.	Yes	§ 63.9295 specifies the compliance dates.
§ 63.6(c)(1)–(2)	Compliance Dates for Existing Sources	No	Subpart PPPPP does not establish standards for existing sources.
§ 63.6(c)(5)	Compliance Dates for Existing Sources	Yes	§ 63.9295(b) specifies the compliance date if a new or reconstructed area source becomes a major source.
§ 63.6(e)(1)(i)	Operation and Maintenance	Yes before December 1, 2020. No on and after December 1, 2020.	See § 63.9305 for general duty requirement.
§ 63.6(e)(1)(ii)	Operation and Maintenance	Yes before December 1, 2020. No on and after December 1, 2020.	
§ 63.6(e)(1)(iii)	Operation and Maintenance	Yes.	
§ 63.6(e)(3)	SSM Plan	Yes before December 1, 2020. No on and after December 1, 2020.	

TABLE 7 TO SUBPART PPPPP OF PART 63—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART PPPPP—Continued

[As stated in 63.9365, you must comply with the General Provisions in §§ 63.1 through 15 that apply to you according to the following table:]

Citation	Subject	Applicable to subpart PPPPP	Explanation
§ 63.6(f)(1)	Compliance Except During SSM	Yes before December 1, 2020. No on and after December 1, 2020.	
§ 63.6(f)(2)–(3)	Methods for Determining Compliance	Yes.	
§ 63.6(g)(1)–(3)	Use of Alternative Standards	Yes.	
§ 63.6(h)	Compliance With Opacity/Visible Emission Standards.	No	Subpart PPPPP does not establish opacity standards and does require continuous opacity monitoring systems (COMS).
§ 63.6(i)(1)–(16)	Extension of Compliance	No	Compliance extension provisions apply to existing sources which do not have emission limitations in subpart PPPPP.
§ 63.6(j)	Presidential Compliance Exemption	Yes.	
§ 63.7(a)(1)–(2)	Performance Test Dates	Yes.	
§ 63.7(a)(3)	Performance Test Required By the Administrator.	Yes.	
§ 63.7(b)–(d)	Performance Test Requirements-Notification, Quality Assurance, Facilities Necessary for Safe Testing, Conditions During Testing.	Yes.	
§ 63.7(e)(1)	Conditions for Conducting Performance Tests.	Yes before December 1, 2020. No, see § 63.9321, on and after December 1, 2020.	
§ 63.7(e)(2)–(4)	Conduct of Performance Tests	Yes.	
§ 63.7(f)	Alternative Test Methods	Yes.	
§ 63.7(g)–(h)	Performance Testing Requirements-Data Analysis, Recordkeeping, Reporting, Waiver of Test.	Yes.	
§ 63.8(a)(1)–(2)	Monitoring Requirements—Applicability	Yes	Subpart PPPPP contains specific requirement for monitoring at § 63.9325.
§ 63.8(a)(4)	Additional Monitoring Requirements	No	Subpart PPPPP does not have monitoring requirement for flares.
§ 63.8(b)	Conduct of Monitoring	Yes.	
§ 63.8(c)(1)	Continuous Monitoring System (CMS) Operation and Maintenance.	Yes.	
§ 63.8(c)(1)(i)	General Duty to Minimize Emissions and CMS Operation.	Yes before December 1, 2020. No on and after December 1, 2020.	
§ 63.8(c)(1)(ii)	Operation and Maintenance of CMS	Yes.	
§ 63.8(c)(1)(iii)	Requirement to Develop SSM Plan for CMS.	Yes before December 1, 2020. No on and after December 1, 2020.	
§ 63.8(c)(2)–(3)	Monitoring System Installation	Yes.	
§ 63.8(c)(4)	CMS	No	§ 63.9335(a) and (b) specifies the requirements.
§ 63.8(c)(5)	COMS	No	Subpart PPPPP does not have opacity or VE standards.
§ 63.8(c)(6)–(8)	CMS Requirements	Yes	Except that subpart PPPPP does not require COMS.
§ 63.8(d)(1)–(2)	CMS Quality Control	Yes.	
§ 63.8(d)(3)	CMS Quality Control	Yes before December 1, 2020. No on and after December 1, 2020.	
§ 63.8(e)	CMS Performance	Yes	Except for § 63.8(e)(5)(ii) which applies to COMS.
§ 63.8(f)(1)–(5)	Alternative Monitoring Method	Yes.	
§ 63.8(f)(6)	Alternative to Relative Accuracy Test	Yes.	
§ 63.8(g)	Data Reduction	Yes before December 1, 2020. No on and after December 1, 2020.	§§ 63.9335 and 63.9340 specify monitoring data reduction.
§ 63.9(a)–(b)	Notification Requirements	Yes.	
§ 63.9(c)	Request for Compliance Extension	No	Compliance extension to not apply to new or reconstructed sources.
§ 63.9(d)	Notification of Special Compliance Requirements for New Sources.	Yes.	
§ 63.9(e)	Notification of Performance Test	No	Subpart PPPPP does not require performance testing.
§ 63.9(f)	Notification of Opacity/VE test	No	Subpart PPPPP does not have opacity/VE standards.
§ 63.9(g)(1)	Additional Notifications When Using CMS	Yes.	

TABLE 7 TO SUBPART PPPPP OF PART 63—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART PPPPP—Continued

[As stated in 63.9365, you must comply with the General Provisions in §§ 63.1 through 15 that apply to you according to the following table:]

Citation	Subject	Applicable to subpart PPPPP	Explanation
§ 63.9(g)(2)	Additional Notifications When Using CMS	No	Subpart PPPPP does not have opacity/VE standards.
§ 63.9(g)(3)	Additional Notifications When Using CMS	Yes.	
§ 63.9(h)	Notification of Compliance Status	Yes.	
§ 63.9(i)	Adjustment of Submittal Deadlines	Yes.	
§ 63.9(j)	Change in Previous Information	Yes.	
§ 63.10(a)	Recordkeeping/Reporting	Yes.	
§ 63.10(b)(1)	General Recordkeeping Requirements	Yes.	
§ 63.10(b)(2)(i)	Recordkeeping of Occurrence and Duration of Startups and Shutdowns.	Yes before December 1, 2020. No on and after December 1, 2020.	
§ 63.10(b)(2)(ii)	Recordkeeping of Occurrence and Duration of Malfunctions.	Yes before December 1, 2020. No on and after December 1, 2020.	See § 63.9355 for recordkeeping of (1) date, time, and duration; (2) listing of affected source or equipment, and an estimate of the quantity of each regulated pollutant emitted over the standard; and (3) actions to minimize emissions and correct the failure.
§ 63.10(b)(2)(iii)	Recordkeeping of Maintenance on Controls and Monitoring Equipment.	Yes.	
§ 63.10(b)(2)(iv)–(v).	Actions Taken to Minimize Emissions During SSM.	Yes before December 1, 2020. No on and after December 1, 2020.	
§ 63.10(b)(2)(vi)–(xi).	CMS Records	Yes.	
§ 63.10(b)(2)(xii)	Records	Yes.	
§ 63.10(b)(2)(xiii)	Records	Yes.	
§ 63.10(b)(2)(xiv)	Records	Yes.	
§ 63.10(b)(3)	Recordkeeping for Applicability Determinations.	Yes.	
§ 63.10(c)(1)–(6), (9)–(14).	Additional Recordkeeping for CMS	Yes.	
§ 63.10(c)(7)–(8)	Records of Excess Emissions and Parameter Monitoring Exceedances for CMS.	No	Specific language is located at § 63.9355 of subpart PPPPP.
§ 63.10(c)(15)	Records Regarding the SSM Plan	Yes before December 1, 2020. No on and after December 1, 2020.	
§ 63.10(d)(1)	General Reporting Requirements	Yes.	
§ 63.10(d)(2)	Report of Performance Test Results	Yes.	
§ 63.10(d)(3)	Reporting of Opacity or VE Observations	No	Subpart PPPPP does not have opacity/VE standards.
§ 63.10(d)(4)	Progress Reports for Sources with Compliance Extensions.	No	Compliance extensions do not apply to new or reconstructed sources.
§ 63.10(d)(5)	SSM Reports	Yes before December 1, 2020. No on and after December 1, 2020.	On and after December 1, 2020, see § 63.9350 for malfunction reporting requirements.
§ 63.10(e)(1) and (2)(i).	Additional CMS Reports	Yes.	
§ 63.10(e)(2)(ii)	Additional CMS Reports	No	Subpart PPPPP does not require COMS.
§ 63.10(e)(3)	Excess Emissions/CMS Performance Reports.	No	Specific language in located in § 63.9350 of subpart PPPPP.
§ 63.10(e)(4)	COMS Data Reports	No	Subpart PPPPP does not require COMS.
§ 63.10(f)	Waiver for Recordkeeping/Reporting	Yes.	
§ 63.11	Control Device Requirements/Flares	No	Subpart PPPPP does not specify use of flares for compliance.
§ 63.12	State Authority and Delegations	Yes.	
§ 63.13	Addresses	Yes.	
§ 63.14	Incorporation by Reference	Yes	ASTM D 6522–00 and ANSI/ASME PTC 19.10–1981 (incorporated by reference—See § 63.14).
§ 63.15	Availability of Information/Confidentiality	Yes.

National Emission Standards for Hazardous Air Pollutants: Generic Maximum Achievable Control Technology Standards Residual Risk and Technology Review for Ethylene Production

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action finalizes the residual risk and technology review (RTR) conducted for the Ethylene Production source category regulated under National Emission Standards for Hazardous Air Pollutants (NESHAP). In addition, the U.S. Environmental Protection Agency (EPA) is taking final action to correct and clarify regulatory provisions related to emissions during periods of startup, shutdown, and malfunction (SSM), including removing general exemptions for periods of SSM, adding work practice standards for periods of SSM where appropriate, and clarifying regulatory provisions for certain vent control bypasses. The EPA is also taking final action to revise requirements for heat exchange systems; add monitoring and operational requirements for flares; add provisions for electronic reporting of performance test results and other reports; and include other technical corrections to improve consistency and clarity. We estimate that these final amendments will reduce hazardous air pollutants (HAP) emissions from this source category by 29 tons per year (tpy) and reduce excess emissions of HAP from flares by an additional 1,430 tpy.

DATES: This final rule is effective on July 6, 2020. The incorporation by reference (IBR) of certain publications listed in the rule is approved by the Director of the Federal Register as of July 6, 2020.

ADDRESSES: The EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2017–0357. All documents in the docket are listed on the *https://www.regulations.gov/* website. Although listed, some information is not publicly available, *e.g.,* Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the internet and will be publicly available only in hard copy form. Publicly available docket materials are available either electronically through *https://www.regulations.gov/,* or in hard copy at the EPA Docket Center, WJC West Building, Room Number 3334, 1301 Constitution Ave. NW, Washington, DC. The Public Reading Room hours of operation are 8:30 a.m. to 4:30 p.m., Eastern Standard Time (EST), Monday through Friday. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the EPA Docket Center is (202) 566–1742.

FOR FURTHER INFORMATION CONTACT: For questions about this final action, contact Mr. Andrew Bouchard, Sector Policies and Programs Division (E143–01), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–4036; and email address: *bouchard.andrew@epa.gov.* For specific information regarding the risk modeling methodology, contact Mr. Mark Morris, Health and Environmental Impacts Division (C539–02), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–5416; and email address: *morris.mark@epa.gov.* For information about the applicability of the NESHAP to a particular entity, contact Ms. Marcia Mia, Office of Enforcement and Compliance Assurance, U.S. Environmental Protection Agency, WJC South Building, 1200 Pennsylvania Ave. NW, Washington, DC 20460; telephone number: (202) 564–7042; and email address: *mia.marcia@epa.gov.*

SUPPLEMENTARY INFORMATION:

Preamble acronyms and abbreviations. We use multiple acronyms and terms in this preamble. While this list may not be exhaustive, to ease the reading of this preamble and for reference purposes, the EPA defines the following terms and acronyms here:

ACC American Chemistry Council
APCD air pollution control device
ASME American Society of Mechanical Engineers
BAAQMD Bay Area Air Quality Management District
BTF beyond-the-floor
Btu/scf British thermal units per standard cubic foot
CAA Clean Air Act

Background information. On October 9, 2019, the EPA proposed revisions to the Generic Maximum Achievable Control Technology (GMACT) Standards NESHAP based on our RTR for the Ethylene Production source category. In this action, we are finalizing decisions and revisions for the rule. We summarize some of the more significant comments we timely received regarding the proposed rule and provide our responses in this preamble. A summary of all other public comments on the proposal and the EPA's responses to those comments is available in the

Summary of Public Comments and Responses for Risk and Technology Review for Ethylene Production, in Docket ID No. EPA–HQ–OAR–2017–0357. A ''tracked changes'' version of the regulatory language that incorporates the changes in this action is available in the docket.

Organization of this document. The information in this preamble is organized as follows:

I. General Information
A. Does this action apply to me?
B. Where can I get a copy of this document and other related information?
C. Judicial Review and Administrative Reconsideration
II. Background
A. What is the statutory authority for this action?
B. What is the Ethylene Production source category and how does the NESHAP regulate HAP emissions from the source category?
C. What changes did we propose for the Ethylene Production source category in our October 9, 2019, RTR proposal?
III. What is included in this final rule?
A. What are the final rule amendments based on the risk review for the Ethylene Production source category?
B. What are the final rule amendments based on the technology review for the Ethylene Production source category?
C. What are the final rule amendments pursuant to CAA section 112(d)(2) and (3) for the Ethylene Production source category?
D. What are the final rule amendments addressing emissions during periods of SSM?
E. What other changes have been made to the NESHAP?
F. What are the effective and compliance dates of the standards?
IV. What is the rationale for our final decisions and amendments for the Ethylene Production source category?
A. Residual Risk Review for the Ethylene Production Source Category
B. Technology Review for the Ethylene Production Source Category
C. Amendments Pursuant to CAA Section 112(d)(2) and (d)(3) for the Ethylene Production Source Category
D. Amendments Addressing Emissions During Periods of SSM
E. Technical Amendments to the EMACT Standards
V. Summary of Cost, Environmental, and Economic Impacts and Additional Analyses Conducted
A. What are the affected facilities?
B. What are the air quality impacts?
C. What are the cost impacts?
D. What are the economic impacts?
E. What analysis of environmental justice did we conduct?
F. What analysis of children's environmental health did we conduct?
VI. Statutory and Executive Order Reviews
A. Executive Orders 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review
B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs
C. Paperwork Reduction Act (PRA)
D. Regulatory Flexibility Act (RFA)
E. Unfunded Mandates Reform Act (UMRA)
F. Executive Order 13132: Federalism
G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks
I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
J. National Technology Transfer and Advancement Act (NTTAA) and 1 CFR part 51
K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations
L. Congressional Review Act (CRA)

I. General Information

A. Does this action apply to me?

Regulated entities. Categories and entities potentially regulated by this action are shown in Table 1 of this preamble.

TABLE 1—NESHAP AND INDUSTRIAL SOURCE CATEGORIES AFFECTED BY THIS FINAL ACTION

Source category	NESHAP	NAICS [1] code
Ethylene Production	GMACT Standards	325110

[1] North American Industry Classification System.

Table 1 of this preamble is not intended to be exhaustive, but rather to provide a guide for readers regarding entities likely to be affected by the final action for the source category listed. To determine whether your facility is affected, you should examine the applicability criteria in the appropriate NESHAP. If you have any questions regarding the applicability of any aspect of this NESHAP, please contact the appropriate person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section of this preamble.

B. Where can I get a copy of this document and other related information?

In addition to being available in the docket, an electronic copy of this final action will also be available on the internet. Following signature by the EPA Administrator, the EPA will post a copy of this final action at: *https://www.epa.gov/stationary-sources-air-pollution/acetal-resins-acrylic-modacrylic-fibers-carbon-black-hydrogen.* Following publication in the **Federal Register**, the EPA will post the **Federal Register** version and key technical documents at this same website.

Additional information is available on the RTR website at *https://www.epa.gov/stationary-sources-air-pollution/risk-and-technology-review-national-emissions-standards-hazardous.* This information includes an overview of the RTR program and links to project websites for the RTR source categories.

C. Judicial Review and Administrative Reconsideration

Under the Clean Air Act (CAA) section 307(b)(1), judicial review of this final action is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit (the Court) by September 4, 2020. Under CAA section 307(b)(2), the requirements established by this final rule may not be challenged separately in any civil or criminal proceedings brought by the EPA to enforce the requirements.

Section 307(d)(7)(B) of the CAA further provides that only an objection to a rule or procedure which was raised with reasonable specificity during the period for public comment (including any public hearing) may be raised during judicial review. This section also provides a mechanism for the EPA to reconsider the rule if the person raising an objection can demonstrate to the Administrator that it was impracticable to raise such objection within the period for public comment or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule. Any person seeking to make such a demonstration should submit a Petition for Reconsideration to the Office of the Administrator, U.S. EPA, Room 3000, WJC South Building,

1200 Pennsylvania Ave. NW, Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. EPA, 1200 Pennsylvania Ave. NW, Washington, DC 20460.

II. Background

A. What is the statutory authority for this action?

Section 112 of the CAA establishes a two-stage regulatory process to address emissions of HAP from stationary sources. In the first stage, we must identify categories of sources emitting one or more of the HAP listed in CAA section 112(b) and then promulgate technology-based NESHAP for those sources. ''Major sources'' are those that emit, or have the potential to emit, any single HAP at a rate of 10 tpy or more, or 25 tpy or more of any combination of HAP. For major sources, these standards are commonly referred to as maximum achievable control technology (MACT) standards and must reflect the maximum degree of emission reductions of HAP achievable (after considering cost, energy requirements, and non-air quality health and environmental impacts). In developing MACT standards, CAA section 112(d)(2) directs the EPA to consider the application of measures, processes, methods, systems, or techniques, including, but not limited to, those that reduce the volume of or eliminate HAP emissions through process changes, substitution of materials, or other modifications; enclose systems or processes to eliminate emissions; collect, capture, or treat HAP when released from a process, stack, storage, or fugitive emissions point; are design, equipment, work practice, or operational standards; or any combination of the above.

For these MACT standards, the statute specifies certain minimum stringency requirements, which are referred to as MACT floor requirements, and which may not be based on cost considerations. See CAA section 112(d)(3). For new sources, the MACT floor cannot be less stringent than the emission control achieved in practice by the best-controlled similar source. The MACT standards for existing sources can be less stringent than floors for new sources, but they cannot be less stringent than the average emission limitation achieved by the best-performing 12 percent of existing sources in the category or subcategory (or the best-performing five sources for categories or subcategories with fewer than 30 sources). In developing MACT standards, we must also consider control options that are more stringent than the floor under CAA section 112(d)(2). We may establish standards more stringent than the floor, based on the consideration of the cost of achieving the emissions reductions, any non-air quality health and environmental impacts, and energy requirements.

In the second stage of the regulatory process, the CAA requires the EPA to undertake two different analyses, which we refer to as the technology review and the residual risk review. Under the technology review, we must review the technology-based standards and revise them ''as necessary (taking into account developments in practices, processes, and control technologies)'' no less frequently than every 8 years, pursuant to CAA section 112(d)(6). Under the residual risk review, we must evaluate the risk to public health remaining after application of the technology-based standards and revise the standards, if necessary, to provide an ample margin of safety to protect public health or to prevent, taking into consideration costs, energy, safety, and other relevant factors, an adverse environmental effect. The residual risk review is required within 8 years after promulgation of the technology-based standards, pursuant to CAA section 112(f). In conducting the residual risk review, if the EPA determines that the current standards provide an ample margin of safety to protect public health, it is not necessary to revise the MACT standards pursuant to CAA section 112(f).[1] For more information on the statutory authority for this rule, see 84 FR 54278, October 9, 2019.

B. What is the Ethylene Production source category and how does the NESHAP regulate HAP emissions from the source category?

The Ethylene Production MACT standards (herein called the EMACT standards) for the Ethylene Production source category are contained in the GMACT NESHAP which also includes MACT standards for several other source categories. The EMACT standards were promulgated on July 12, 2002 (67 FR 46258), and codified at 40 CFR part 63, subparts XX and YY. The EMACT standards regulate HAP emissions from ethylene production units located at major sources. An ethylene production unit is a chemical manufacturing process unit in which ethylene and/or propylene are produced by separation from petroleum refining process streams or by subjecting hydrocarbons to high temperatures in the presence of steam. The EMACT defines the affected source as all storage vessels, ethylene process vents, transfer racks, equipment, waste streams, heat exchange systems, and ethylene cracking furnaces and associated decoking operations that are associated with each ethylene production unit located at a major source as defined in CAA section 112(a).

As of January 1, 2017, there were 26 facilities in operation and subject to the EMACT standards. We are also aware of the expansion and construction of several facilities. Based upon this anticipated growth for the Ethylene Production source category, we estimate that a total of 31 facilities will ultimately be subject to the EMACT standards and complying with this final rule over the course of the next 3 years. The source category and the EMACT standards are further described in the October 9, 2019, RTR proposal. See 84 FR 54278.

C. What changes did we propose for the Ethylene Production source category in our October 9, 2019, RTR proposal?

On October 9, 2019, the EPA published a proposed rule in the **Federal Register** for the EMACT standards of the GMACT NESHAP, 40 CFR part 63, subparts XX and YY, that took into consideration the RTR analyses. We proposed to find that the risks from the source category are acceptable, the current standards provide an ample margin of safety to protect public health, and more stringent standards are not necessary to prevent an adverse environmental effect. In addition, pursuant to the technology review for the Ethylene Production source category, we proposed that no revisions to the current standards are necessary for ethylene process vents, transfer racks, equipment leaks, and waste streams; however, we did propose changes for storage vessels and heat exchanger systems. We proposed revisions to the storage vessels control applicability requirements, pursuant to CAA section 112(d)(6), to tighten both the threshold for maximum true vapor pressure (MTVP) of total organic HAP (*i.e.,* decreasing it from 3.4 kilopascals (kPa) or greater to 0.69 kPa or greater) and the threshold for storage vessel capacity (*i.e.,* decreasing it from 95 cubic meter

[1] The Court has affirmed this approach of implementing CAA section 112(f)(2)(A): *NRDC* v. *EPA,* 529 F.3d 1077, 1083 (DC Cir. 2008) (''If EPA determines that the existing technology-based standards provide an 'ample margin of safety,' then the Agency is free to readopt those standards during the residual risk rulemaking.'').

(m^3) to 59 m^3) and to require storage vessels meeting these criteria to reduce emissions of total organic HAP by 98 weight-percent or use a floating roof storage vessel subject to the requirements of 40 CFR part 63, subpart WW. In addition, we proposed revisions to the heat exchange system requirements, pursuant to CAA section 112(d)(6), to require owners or operators to use the Modified El Paso Method and repair leaks of total strippable hydrocarbon concentration (as methane) in the stripping gas of 6.2 parts per million by volume (ppmv) or greater.

We also proposed the following amendments:

- Revisions to the operating and monitoring requirements for flares used as air pollution control devices (APCDs), pursuant to CAA section 112(d)(2) and (3);
- requirements and clarifications for periods of SSM and bypasses, including for pressure relief device(s) (PRD) releases, bypass lines on closed vent systems, in situ sampling systems, maintenance activities, and certain gaseous streams routed to a fuel gas system, pursuant to CAA section 112(d)(2) and (3);
- work practice standards for decoking ethylene cracking furnaces (*i.e.,* minimizing emissions from the coke combustion activities in an ethylene cracking furnace), pursuant to CAA section 112(d)(2) and (3);
- revisions to the SSM provisions of the NESHAP (in addition to those related to flares, vent control bypasses, or ethylene cracking furnace decoking operations) in order to ensure that they are consistent with the Court decision in *Sierra Club* v. *EPA,* 551 F. 3d 1019 (DC Cir. 2008), which vacated two provisions that exempted source owners and operators from the requirement to comply with otherwise applicable CAA section 112(d) emission standards during periods of SSM;
- a requirement for electronic submittal of performance test results and reports, and Notification of Compliance Status (NOCS) reports;
- removal of certain exemptions for once-through heat exchange systems;
- overlap provisions for equipment at ethylene production facilities subject to both the EMACT standards and synthetic organic chemicals manufacturing equipment leak standards at 40 CFR part 60, subpart VVa;
- IBR of an alternative test method for EPA Methods 3A and 3B (for the manual procedures only and not the instrumental procedures);
- IBR of an alternative test method for EPA Method 18 (with caveats);
- IBR of an alternative test method for EPA Method 320 (with caveats); and
- several minor editorial and technical changes in the subpart.

III. What is included in this final rule?

This action finalizes the EPA's determinations pursuant to the RTR provisions of CAA section 112 for the Ethylene Production source category and amends the EMACT standards based on those determinations. This action also finalizes other changes to the NESHAP, including adding requirements and clarifications for periods of SSM and bypasses; revisions to the operating and monitoring requirements for flares used as APCDs; adding provisions for electronic reporting of performance test results and reports, NOCS reports, and Periodic Reports; and other minor editorial and technical changes. This action also reflects several changes to the October 9, 2019 RTR proposal in consideration of comments received during the public comment period as described in section IV of this preamble.

A. What are the final rule amendments based on the risk review for the Ethylene Production source category?

This section describes the final amendments to the EMACT standards being promulgated pursuant to CAA section 112(f). The EPA proposed no changes to the EMACT standards based on the risk reviews conducted pursuant to CAA section 112(f). In this action, we are finalizing our proposed determination that risks from this source category are acceptable, and that the standards provide an ample margin of safety to protect public health and prevent an adverse environmental effect. Section IV.A.3 of this preamble provides a summary of key comments we received regarding risk review and our responses.

B. What are the final rule amendments based on the technology review for the Ethylene Production source category?

The EPA is finalizing its proposed determination in the technology review that there are no developments in practices, processes, and control technologies that warrant revisions to the EMACT standards for process vents, transfer racks, equipment leaks, and waste streams in this source category. Therefore, we are not finalizing revisions to the EMACT standards for these emission sources under CAA section 112(d)(6). Also, based on comments received on the proposed rulemaking, we are not finalizing the proposed revisions to the EMACT standards for storage vessels under CAA section 112(d)(6) to tighten the control applicability thresholds for MTVP of total organic HAP (*i.e.,* decreasing it from 3.4 kPa or greater to 0.69 kPa or greater) and storage vessel capacity (*i.e.,* decreasing it from 95 m^3 to 59 m^3).

For heat exchange systems, we determined that there are developments in practices, processes, and control technologies that warrant revisions to the EMACT standards for this source category. Therefore, to satisfy the requirements of CAA section 112(d)(6), we are revising the EMACT standards, consistent with the October 9, 2019, RTR proposal, to include revisions to the heat exchange system requirements to require owners or operators to use the Modified El Paso Method and repair leaks of total strippable hydrocarbon concentration (as methane) in the stripping gas of 6.2 ppmv or greater. In addition, based on comments received on the proposed rulemaking, we are also including an alternative mass-based leak action level of total strippable hydrocarbon equal to or greater than 0.18 kilograms per hour for heat exchange systems with a recirculation rate of 10,000 gallons per minute (gpm) or less.

Section IV.B.3 of this preamble provides a summary of key comments we received on the technology review and our responses.

C. What are the final rule amendments pursuant to CAA section 112(d)(2) and (3) for the Ethylene Production source category?

Consistent with *Sierra Club* v. *EPA* 551 F. 3d 1019 (D.C. Cir. 2008) and the October 9, 2019, RTR proposal, we are revising monitoring and operational requirements for flares to ensure that ethylene production facilities that use flares as APCDs meet the EMACT standards at all times when controlling HAP emissions. In addition, we are adding provisions and clarifications for periods of SSM and bypasses, including PRD releases, bypass lines on closed vent systems, in situ sampling systems, maintenance activities, and certain gaseous streams routed to a fuel gas system to ensure that CAA section 112 standards apply continuously. Also, for the same reason, we are adopting the proposed decoking operations work practice standards into the final rule with only minor changes, such as adding delay of repair provisions to the flame impingement inspection requirements, adding clarifying text to the carbon dioxide (CO_2) monitoring, coil outlet temperature monitoring, air removal, and radiant tube(s) treatment requirements, and removing unnecessary recordkeeping associated

with the time each isolation valve inspection is performed and the results of that inspection even if no problem was found. For details about these minor changes, refer to Section 6.7 of the document, *Summary of Public Comments and Responses for the Risk and Technology Reviews for the Ethylene Production Source Category,* available in the docket for this action.

Lastly, based on comments received on the proposed rulemaking, we are adding a separate standard for storage vessel degassing for storage vessels subject to the control requirements in Table 7 to 40 CFR 63.1103(e)(3)(b) and (e)(3)(c).

Section IV.C.3 of this preamble provides a summary of key comments we received on the CAA section 112(d)(2) and (3) provisions and our responses.

D. What are the final rule amendments addressing emissions during periods of SSM?

We are finalizing the proposed amendments to the EMACT standards to remove and revise provisions related to SSM. In its 2008 decision in *Sierra Club* v. *EPA,* 551 F.3d 1019 (D.C. Cir. 2008), the Court vacated portions of two provisions in the EPA's CAA section 112 regulations governing the emissions of HAP during periods of SSM. Specifically, the Court vacated the SSM exemption contained in 40 CFR 63.6(f)(1) and (h)(1), holding that under section 302(k) of the CAA, emissions standards or limitations must be continuous in nature and that the SSM exemption violates the CAA's requirement that some CAA section 112 standards apply continuously. As detailed in section IV.E.1 of the proposal preamble, the Ethylene Production NESHAP requires that standards apply at all times (see 40 CFR 63.1108(a)(4)(i)), consistent with the Court decision in *Sierra Club* v. *EPA,* 551 F. 3d 1019 (D.C. Cir. 2008). We determined that facilities in this source category can generally meet the applicable EMACT standards at all times, including periods of startup and shutdown. As discussed in the proposal preamble, the EPA interprets CAA section 112 as not requiring emissions that occur during periods of malfunction to be factored into development of CAA section 112 standards, although the EPA has the discretion to set standards for malfunctions where feasible. Where appropriate, and as discussed in section III.C of this preamble, we are also finalizing alternative standards for certain emission points during periods of SSM to ensure a continuous CAA section 112 standard applies ''at all times.'' Other than for those specific emission points discussed in section III.C of this preamble, the EPA determined that no additional standards are needed to address emissions during periods of SSM.

We are also finalizing, as proposed, eliminating SSM exemptions for waste streams at facilities with a total annual benzene less than 10 megagrams per year (Mg/yr) and amending language in the definitions of ''dilution steam blowdown waste stream'' and ''spent caustic waste stream'' at 40 CFR 63.1082(b) to remove the exclusion for streams generated from sampling, maintenance activities, or shutdown purges. In addition, we are finalizing a revision to the performance testing requirements at 40 CFR 63.1108(b)(4)(ii)(B). The final performance testing provisions do not include the language that precludes startup and shutdown periods from being considered ''representative'' for purposes of performance testing, and instead allows performance testing during periods of startup or shutdown if specified by the Administrator. However, the final performance testing provisions prohibit performance testing during malfunctions because these conditions are not representative of normal operating conditions. The final rule also requires that operators maintain records to document that operating conditions during the test represent normal operations.

The legal rationale and detailed changes for SSM periods that we are finalizing here are set forth in the proposed rule. See 84 FR 54278, October 9, 2019. Also, based on comments received during the public comment period, we are revising 40 CFR 63.1103(e)(9) to sufficiently address the SSM exemption provisions from subparts referenced by the EMACT standards. For example, in addition to what we proposed, we are also clarifying that the certain referenced provisions do not apply when demonstrating compliance with the EMACT standards, such as phrases like ''other than a start-up, shutdown, or malfunction'' in the recordkeeping and reporting requirements of 40 CFR 63, subparts SS and UU. We are also not removing as proposed the term ''breakdowns'' in 40 CFR 63.998(b)(2)(i) as well as 40 CFR 63.998(d)(1)(ii) in its entirety.

Section IV.D.3 of this preamble provides a summary of key comments we received on the SSM provisions and our responses.

E. What other changes have been made to the NESHAP?

This rule also finalizes, as proposed, revisions to several other NESHAP requirements. We describe these revisions in this section as well as other revisions that have changed since proposal. To increase the ease and efficiency of data submittal and data accessibility, we are finalizing, as proposed, a requirement that owners and operators of facilities in the Ethylene Production source category submit electronic copies of certain required performance test results and reports and NOCS reports through the EPA's Central Data Exchange (CDX) website using an electronic performance test report tool called the Electronic Reporting Tool. In addition, in the final rule, we are correcting an error to clarify that Periodic Reports must also be submitted electronically (*i.e.,* through the EPA's CDX using the appropriate electronic report template for this subpart) beginning no later than the compliance dates specified in 40 CFR 63.1102(c) or once the report template has been available on the Compliance and Emissions Data Reporting Interface (CEDRI) website for at least 1 year, whichever date is later. Furthermore, we are finalizing, as proposed, provisions that allow facility operators the ability to seek extensions for submitting electronic reports for circumstances beyond the control of the facility, *i.e.,* for a possible outage in the CDX or CEDRI or for a *force majeure* event in the time just prior to a report's due date, as well as the process to assert such a claim.

To correct a disconnect between having a National Pollutant Discharge Elimination System (NPDES) permit that meets certain allowable discharge limits at the discharge point of a facility (*e.g.,* outfall) and being able to adequately identify a leak, we are finalizing, as proposed, the removal of certain exemptions for once-through heat exchange systems to comply with cooling water monitoring requirements.[2] Further, based on comments received on the proposed rulemaking, we are clarifying that the calibration drift assessment provisions at 40 CFR 60.485a(b)(2) apply only if the owner or

[2] Cooling water from a once-through heat exchange system at a petrochemical plant can be mixed with other sources of water (*e.g.,* cooling water used in once-through heat exchange systems in non-ethylene source categories, stormwater, treated wastewater, etc.) in sewers, trenches, and ponds prior to discharge from the plant. If this point of discharge from the plant is into a ''water of the United States,'' then the facility is required to have a NPDES permit and to meet certain pollutant discharge limits.

operator is subject to those requirements in 40 CFR part 60, subpart VVa [see the 40 CFR part 60, subpart VVa overlap provisions in the final rule at 40 CFR 63.1100(g)(4)(iii)].

We are finalizing all of the revisions that we proposed for clarifying text or correcting typographical errors, grammatical errors, and cross-reference errors. These editorial corrections and clarifications are summarized in Table 9 of the proposal. See 84 FR 54278, October 9, 2019. We are also including several additional minor clarifying edits in the final rule based on comments received during the public comment period. We did not receive many substantive comments on these other amendments in the Ethylene Production RTR proposal. The comments and our specific responses to these items can be found in the document, *Summary of Public Comments and Responses for the Risk and Technology Reviews for the Ethylene Production Source Category,* available in the docket for this action.

F. What are the effective and compliance dates of the standards?

The revisions to the EMACT standards being promulgated in this action are effective on July 6, 2020. From our assessment of the timeframe needed for implementing the entirety of the revised requirements (see 84 FR 54278, October 9, 2019), the EPA proposed a period of 3 years to be the most expeditious compliance period practicable. Although opposing comments regarding the proposed compliance dates were received during the public comment period, we are finalizing the 3-year compliance period as proposed. Amendments to EMACT standards for adoption under CAA sections 112(d)(2) and (3) and 112(d)(6) are subject to the compliance deadlines outlined in the CAA under section 112(i). For existing sources, CAA section 112(i) provides that the compliance date shall be as expeditiously as practicable, but no later than 3 years after the effective date of the standard. For new sources, compliance is required by the effective date of the final amendments or upon startup, whichever is later. As explained in the preamble to the proposed rule (84 FR 54278, October 9, 2019), the EPA recognizes the confusion that multiple different compliance dates for individual requirements would create and the additional burden such an assortment of dates would impose; and from our assessment of the timeframe needed for compliance with the entirety of the revised requirements, the EPA considers a period of 3 years after the effective date of the final rule to be the most expeditious compliance period practicable. Furthermore, as discussed in sections III and IV of this preamble, we are adding separate work practice standards to the final rule for the following SSM activities/events: (1) Periods of SSM for when flares are used as an APCD, (2) periods of SSM for certain vent streams (*i.e.* PRD releases and maintenance vents), (3) vent control bypasses for certain vent streams (*i.e.,* closed vent systems containing bypass lines, in situ sampling systems, and flares connected to fuel gas systems), and (4) decoking operations for ethylene cracking furnaces. The provisions being finalized are similar to the requirements promulgated in the Petroleum Refinery NESHAP. As we discovered during the Petroleum Refinery NESHAP rulemaking, the challenges faced by affected sources in complying with these requirements necessitated additional compliance time from what was promulgated, eventually having to move the original compliance date of these provisions from February 1, 2016, to August 1, 2018, an additional 2 and a half years.[3] Therefore the 3 year compliance date that was proposed for the EMACT standards provides a consistent time allowance to affected sources as was needed for Petroleum Refineries to fully implement the work practice standards. Thus, the compliance date of the final amendments for all existing affected sources, and all new affected sources that commence construction or reconstruction after December 6, 2000, and on or before October 9, 2019, is no later than July 6, 2023, or upon startup, whichever is later. The compliance date of the final amendments for all ethylene production new affected sources that commenced construction or reconstruction after October 9, 2019, is the effective date of these final rule amendments to the EMACT standards of July 6, 2020, or upon startup, whichever is later.

IV. What is the rationale for our final decisions and amendments for the Ethylene Production source category?

For each issue, this section provides a description of what we proposed and what we are finalizing for the issue, the EPA's rationale for the final decisions and amendments, and a summary of key comments and responses. For all comments not discussed in this preamble, comment summaries and the EPA's responses can be found in the comment summary and response document available in the docket.

A. Residual Risk Review for the Ethylene Production Source Category

1. What did we propose pursuant to CAA section 112(f) for the Ethylene Production source category?

Pursuant to CAA section 112(f), the EPA conducted a residual risk review and presented the results of this review, along with our proposed decisions regarding risk acceptability and ample margin of safety, in the October 9, 2019, proposed rule for 40 CFR part 63, subparts XX and YY (84 FR 54278). The results of the risk assessment for the proposal are presented briefly in Table 2 of this preamble. More detail is in the residual risk technical support document, *Residual Risk Assessment for the Ethylene Production Source Category in Support of the 2019 Risk and Technology Review Proposed Rule,* which is available in the docket for this rulemaking.

TABLE 2—ETHYLENE PRODUCTION INHALATION RISK ASSESSMENT RESULTS

Number of facilities [1]	Maximum individual cancer risk (in 1 million) [2]		Estimated population at increased risk of cancer ≥ 1-in-1 million		Estimated annual cancer incidence (cases per year)		Maximum chronic noncancer TOSHI [3]		Maximum screening acute noncancer HQ [4]
	Based on . . .		Based on . . .		Based on . . .		Based on . . .		
	Actual emissions level	Allowable emissions level	Actual emissions level	Allowable emissions level	Actual emissions level	Allowable emissions level	Actual emissions level	Allowable emissions level	Based on actual emissions level
31	100	100	2.8 million ...	4.6 million ...	0.1	0.2	1	1	HQ_{REL} = <1

[1] Number of facilities evaluated in the risk analysis.

[2] Maximum individual excess lifetime cancer risk due to HAP emissions from the source category. There is only one census block, and one person, at this risk level.

[3] Maximum target organ-specific hazard index (TOSHI). The target organ systems with the highest TOSHI for the source category are neurological and reproductive. The respiratory TOSHI was calculated using the California EPA chronic reference exposure level (REL) for acrolein.

[4] The maximum estimated acute exposure concentration was divided by available short-term threshold values to develop an array of hazard quotient (HQ) values. HQ values shown use the lowest available acute threshold value, which in most cases is the REL. When an HQ exceeds 1, we also show the HQ using the next lowest available acute dose-response value.

Using actual emissions data, the results of the proposed inhalation risk assessment, as shown in Table 2 of this preamble, indicate the estimated cancer maximum individual risk (MIR) is 100-in-1 million, with naphthalene and benzene as the major contributors to the risk. There is only one census block, and one person, at this risk level. The second-highest facility cancer risk is 30-in-1 million. At proposal, the total estimated cancer incidence from this source category was estimated to be 0.1 excess cancer cases per year, or one excess case in every 10 years. Approximately 2.8 million people were estimated to have cancer risks above 1-in-1 million from HAP emitted from the facilities in this source category. At proposal, the estimated maximum chronic noncancer TOSHI for the source category was 1 (neurological and respiratory) driven by emissions of manganese and epichlorohydrin.

Using the MACT-allowable emissions, the risk results at proposal for the inhalation risk assessment indicated that the estimated cancer MIR was 100-in-1 million with naphthalene and benzene emissions driving the risks, and that the estimated maximum chronic noncancer TOSHI was 1 with manganese and epichlorohydrin as the major contributors to the TOSHI. At proposal, the total estimated cancer incidence from this source category considering allowable emissions was 0.2 excess cancer cases per year or 1 excess case in every 5 years. Based on allowable emission rates, 4.6 million people were estimated to have cancer risks above 1-in-1 million.

As shown in Table 2 of this preamble, the reasonable worst-case acute HQ (based on the REL) at proposal was less than 1. This value is the highest HQ that is outside facility boundaries. No facilities were estimated to have an HQ greater than or equal to 1 based on any benchmark (REL, acute exposure guideline level, or emergency response planning guidelines). In addition, at proposal, we identified emissions of arsenic compounds, cadmium compounds, mercury compounds, and polycyclic organic matter (POM), all HAP known to be persistent and bio-accumulative in the environment. The multipathway risk screening assessment resulted in a maximum Tier 2 cancer screening value of 30 for arsenic and a maximum Tier 3 noncancer screening value of 2 for mercury compounds. Based on facility-specific analyses performed for mercury for other source categories, we concluded that such analyses would reduce the mercury screening value to 1 or lower. In addition, a screening-level evaluation of the potential adverse environmental risk associated with emissions of arsenic, cadmium, hydrochloric acid, hydrofluoric acid, lead, mercury, and POMs indicated that no ecological benchmarks were exceeded.

We weighed all health risk factors, including those shown in Table 2 of this preamble, in our risk acceptability determination and proposed that the risks posed by the Ethylene Production source category are acceptable (section IV.C.1 of proposal preamble, 84 FR 54311, October 9, 2019).

We then considered whether the existing EMACT standards provide an ample margin of safety to protect public health and whether, taking into consideration costs, energy, safety, and other relevant factors, more stringent standards are required to prevent an adverse environmental effect. In considering whether the standards are required to provide an ample margin of safety to protect public health, we considered the same risk factors that we considered for our acceptability determination and also considered the costs, technological feasibility, and other relevant factors related to emissions control options that might reduce risk associated with emissions from the source category. We proposed that additional emissions controls for the Ethylene Production source category are not necessary to provide an ample margin of safety to protect public health and that more stringent standards are not necessary to prevent an adverse environmental effect (section IV.C.2 of proposal preamble, 84 FR 54312, October 9, 2019).

We also evaluate risk from whole facility emissions in order to help put the risks in context. Whole facility (or ''facility-wide'') emissions include those regulated under this source category plus all other emissions generated at each facility. The results of the chronic inhalation cancer risk assessment based on facility-wide emissions are more uncertain and rely on the quality of the emissions data collected for source categories outside this regulatory review. These emissions sources may not undergo the same level of data quality review as those being assessed in this regulatory assessment. The estimated maximum lifetime individual cancer risk based on facility-wide emissions is 2,000-in-1 million, with ethylene oxide from non-category (non-ethylene production process) emissions driving the risk. The total estimated cancer incidence based on facility-wide emissions is 1 excess cancer case per year. Approximately 6,500,000 people are estimated to have cancer risks above 1-in-1 million from HAP emitted from all sources at the facilities in this source category. The estimated maximum chronic noncancer hazard index (HI) based on facility-wide emissions is 4 (for the respiratory HI), driven by emissions of chlorine from non-category (non-ethylene production process) emissions. Approximately 200 people are estimated to be exposed to noncancer HI levels above 1.

2. How did the risk review change for the Ethylene Production source category?

We have not changed any aspect of the risk assessment since the October 9, 2019, RTR proposal for the Ethylene Production source category.

3. What key comments did we receive on the risk review, and what are our responses?

We received comments in support of and against the proposed residual risk review and our determination that no revisions were warranted under CAA section 112(f)(2) for the Ethylene Production source category. Generally, the comments that were not supportive of the determination from the risk reviews suggested changes to the underlying risk assessment methodology. For example, some commenters stated that the 100-in-1 million lifetime cancer risk cannot be considered safe or ''acceptable,'' and the EPA should include emissions outside of the source categories in question in the risk assessment and assume that pollutants with noncancer health risks have no safe level of exposure. After review of all the comments received, we determined that no changes were necessary. The comments and our specific responses can be found in the document, *Summary of Public Comments and Responses for the Risk and Technology Reviews for the Ethylene Production Source Category,* available in the docket for this action.

4. What is the rationale for our final approach and final decisions for the risk review?

As noted in our proposal, the EPA sets standards under CAA section 112(f)(2) using ''a two-step standard-setting approach, with an analytical first step to determine an 'acceptable risk' that considers all health information, including risk estimation uncertainty, and includes a presumptive limit on MIR of approximately 1-in-10 thousand'' (84 FR 54278, October 9, 2019; see also 54 FR 38045, September 9, 1989). We weigh all health risk factors in our risk acceptability determination, including the cancer MIR, cancer incidence, the maximum cancer TOSHI, the maximum acute noncancer HQ, the extent of noncancer risks, the distribution of cancer and noncancer risks in the exposed population, multipathway risks, and the risk estimation uncertainties.

Since proposal, neither the risk assessment nor our determinations regarding risk acceptability, ample margin of safety, or adverse environmental effects have changed. For the reasons explained in the proposed rule, we determined that the risks from the Ethylene Production source category are acceptable, the current standards provide an ample margin of safety to protect public health, and more stringent standards are not necessary to prevent an adverse environmental effect. Therefore, we are not revising the EMACT standards to require additional controls pursuant to CAA section 112(f)(2) based on the residual risk review, and we are readopting the existing standards under CAA section 112(f)(2).

B. Technology Review for the Ethylene Production Source Category

1. What did we propose pursuant to CAA section 112(d)(6) for the Ethylene Production source category?

Pursuant to CAA section 112(d)(6), the EPA proposed to conclude that no revisions to the current EMACT standards are necessary for ethylene process vents, transfer racks, equipment leaks, and waste streams (sections IV.D.2 through IV.D.5 of proposal preamble, 84 FR 54314, October 9, 2019). We did not find any developments (since promulgation of the original NESHAP) in practices, processes, and control technologies that could be applied to ethylene process vents and that could be used to reduce emissions from ethylene production facilities. We also did not identify any developments in work practices, pollution prevention techniques, or process changes that could achieve emission reductions from ethylene process vents. For transfer racks, we identified one emission reduction option, at proposal, to revise the transfer rack applicability threshold (for volumetric throughput of liquid loaded) from 76 m^3 per day to 1.8 m^3 per day to reflect the more stringent applicability threshold of other chemical sector standards that regulate emissions from transfer rack operations (*i.e.,* 40 CFR part 63, subparts F and G and 40 CFR part 63, subpart FFFF). At proposal, we also identified two developments in leak detection and repair (LDAR) practices and processes for equipment leaks: (1) Lowering the leak definition for valves in gas and vapor service or in light liquid service from 500 parts per million (ppm) to 100 ppm and (2) lowering the leak definition for pumps in light liquid service from 1,000 ppm to 500 ppm. In addition, we identified two emission reduction options, at proposal, for waste streams: (1) specific performance parameters for an enhanced biological unit beyond those required in the Benzene Waste Operations NESHAP and (2) treatment of wastewater streams with a volatile organic compounds (VOC) content of 750 ppmv or higher by steam stripping prior to any other treatment process for facilities with high organic loading rates (*i.e.,* facilities with total annualized benzene quantity of 10 Mg/yr or more). However, based on the costs and emission reductions for each of the proposed options (for transfer racks, equipment leaks, and waste streams), we considered none of these options to be cost effective for reducing emissions from these emission sources at ethylene production units, and we proposed that it is not necessary to revise the EMACT standards for these emission sources pursuant to CAA section 112(d)(6).

Also, pursuant to CAA section 112(d)(6), we proposed revisions to the current EMACT standards for storage vessels and heat exchange systems (sections IV.D.1 and IV.D.6 of proposal preamble, 84 FR 54314, October 9, 2019). For storage vessels, we proposed tightening both the applicability threshold for MTVP of total organic HAP (*i.e.,* decreasing it from 3.4 kPa or greater to 0.69 kPa or greater) and the applicability threshold for storage vessel capacity (*i.e.,* decreasing it from 95 m^3 to 59 m^3) in Table 7 at 40 CFR 63.1103(e)(3)(a)(1) and 40 CFR 63.1103(e)(3)(b)(1), respectively. For heat exchange systems, we proposed to add a new provision, 40 CFR 63.1086(e), that would require owners or operators to use the Modified El Paso Method to monitor for leaks and to repair leaks of total strippable hydrocarbon concentration (as methane) in the stripping gas of 6.2 ppmv or greater. We also proposed to add a new provision, 40 CFR 63.1088(d), establishing a delay of repair action level of total strippable hydrocarbon concentration (as methane) in the stripping gas of 62 ppmv, that if exceeded during leak monitoring, would require immediate repair (*i.e.,* the leak found cannot be put on delay of repair and would be required to be repaired within 30 days of the monitoring event). This would apply to both monitoring heat exchange systems and individual heat exchangers by replacing the use of any 40 CFR part 136 water sampling method with the Modified El Paso Method and removing the option that allows for use of a surrogate indicator of leaks. Finally, we proposed to add a new provision, 40 CFR 63.1087(c), requiring re-monitoring at the monitoring location where a leak is identified to ensure that any leaks found are fixed.

2. How did the technology review change for the Ethylene Production source category?

The EPA has not changed any aspect of the technology review for process vents, transfer racks, equipment leaks, and waste streams since the October 9, 2019, RTR proposal for the Ethylene Production source category. However, based on comments received on the proposed rulemaking, we are not finalizing the proposed revisions to the EMACT standards for storage vessels under CAA section 112(d)(6) to tighten the applicability threshold for MTVP of total organic HAP (*i.e.,* decreasing it from 3.4 kPa or greater to 0.69 kPa or greater) and the applicability threshold for storage vessel capacity (*i.e.,* decreasing it from 95 m^3 to 59 m^3). Moreover, although we are revising the EMACT standards for heat exchange systems consistent with the October 9, 2019, RTR proposal, we are also including, based on comments received on the proposed rulemaking, an alternative mass-based leak action level of total strippable hydrocarbon equal to or greater than 0.18 kilograms per hour for heat exchange systems with a recirculation rate of 10,000 gpm or less.

3. What key comments did we receive on the technology review, and what are our responses?

The EPA received comments in support of and against the proposed technology review amendments and our determination that no revisions were warranted under CAA section 112(d)(6) for process vents, transfer racks, equipment leaks, and waste streams in the Ethylene Production source category and that revisions were warranted for storage vessels and heat exchange systems in the Ethylene Production source category. Generally, for process vents, transfer racks, equipment leaks, and waste streams, the comments were either supportive of the determination that no cost-effective developments from the technology review were found, or that the Agency should re-open and re-evaluate the MACT standards for these emission sources and not consider cost in the technology review for the emissions sources. Based on our review of the comments received for process vents, transfer racks, equipment leaks, and waste streams, we are finalizing our determination that no cost-effective developments exist and that it is not necessary to revise these emission standards under CAA section 112(d)(6).

For storage vessels, the EPA received additional information from commenters on material composition, storage vessels that would be affected by the proposed option, and costs necessary for control of the storage vessels that would be affected by the proposed control option. After review of all the comments received, we determined that it is not cost effective to revise the storage vessel control requirements and are not finalizing revisions for this emissions source under CAA section 112(d)(6).

For heat exchange systems, the EPA received additional information from commenters on costs necessary for control of these sources as well as comments on a number of technical clarifications and allowance of compliance with an alternative mass-based leak action level should the EPA finalize the requirements for heat exchange systems. After review of all the comments received, we determined that it is cost effective to revise the heat exchange system requirements, and we are finalizing revisions for this emissions source under CAA section 112(d)(6) however, we are also including, based on comments received on the proposed rulemaking, an alternative mass-based leak action level of total strippable hydrocarbon equal to or greater than 0.18 kilograms per hour for heat exchange systems with a recirculation rate of 10,000 gpm or less.

This section provides comment and responses for the key comments received regarding the technology review amendments we proposed for storage vessels and heat exchange systems. Comment summaries and the EPA's responses for additional issues raised regarding the proposed requirements resulting from our technology review are in the document, *Summary of Public Comments and Responses for the Risk and Technology Reviews for the Ethylene Production Source Category,* available in the docket for this action.

Comment: We received comments in support of and against the proposed changes to the storage vessel capacity and vapor pressure thresholds and corresponding control requirements. Most of the commenters opposed to the proposed requirements said the EPA's proposed changes to the capacity and vapor pressure thresholds for control of storage vessel emissions are not cost-effective. The commenters said that based on their analysis and using the EPA percentages of annual cost components (9.47-percent capital recovery, 5-percent maintenance, 4 percent for taxes, insurance, and administration, $380 per ton of VOC recovered), the average capital cost for control is approximately $1.2 million per tank, the average annual cost is $216,000 per tank, and the cost effectiveness of the control option is $108,000 per ton of VOC. The commenters said that their estimates account for materials and installation, in addition to the necessary cleaning and preparation required to install the floating roof or make the necessary connections to the closed vent system. The commenters asserted that degassing and cleaning do not appear to be included in the EPA's cost calculation and should be added as these are necessary steps to prepare the tanks for modification and ensure worker safety. The commenter said that their cost estimate is much higher than the EPA's estimate; and the commenters contended the EPA's estimated capital investment for the installation of an internal floating roof (IFR) on an existing fixed roof tank is unrealistic and should be revised. The commenters stated that at least one facility would install a new closed vent system to an existing control device, instead of an IFR, due to more favorable economics or site-specific constraints. The commenters said that the cost of this closed vent system is approximately $825,000 per tank (materials and installation). The commenters also provided certain technical details and cost information that they claimed as CBI.

Response: We are not finalizing the proposed requirements to tighten the storage vessel capacity and MTVP thresholds in response to comments and additional costs information that the EPA received on the proposal. Specifically, we reviewed and agree with the additional information submitted by commenters on the specific storage vessels that would be affected (*e.g.,* material composition and vapor pressure data, costs to control those storage vessels, and estimated emissions reductions). Importantly, the CBI submitted by one commenter provided details showing that installation of an IFR was not an option for their specific facility due to technical constraints. In addition, given that the proposed option would result in 10 tpy of VOC reductions nationwide (and lower emissions reductions for HAP) and cost over $1 million annually, we find the control of storage vessels at $108,000 per ton for VOC (and higher cost effectiveness for HAP) is not cost effective. Further, the proposed option would only affect six of the approximately 248 storage vessels in the source category [assuming an average of eight storage vessels per facility from the CAA section 114 Information Collection Request (ICR) data] and would not meaningfully reduce overall

emissions from the source category. Given all of this information, we are not finalizing the proposed requirements to tighten the storage vessel capacity and MTVP thresholds and are keeping the current MACT level of control for storage vessels in place.

Comment: A commenter stated that the proposed technology review amendments do not represent MACT and noted three control options were identified for storage vessels, but only one was adopted into the proposed rule. The commenter emphasized that many new ethylene production facilities are planned to be constructed or are under construction and the EPA must address their HAP emissions by applying the most stringent control technologies.

Similarly, another commenter stated that it would be unlawful, arbitrary, and capricious for the EPA not to set stronger standards for emissions from storage vessels. The commenter stated that although the EPA identified two other developments in technology for storage vessels: (1) Requiring LDAR for fittings on fixed roof storage vessels (*e.g.,* access hatches) using EPA Method 21, and the use of liquid level overfill warning monitors and roof landing warning monitors on storage vessels with an IFR or external floating roof (EFR); and (2) the conversion of EFRs to IFRs through use of geodesic domes, the EPA declined to require these controls simply because the control options were not cost effective. The commenter insisted that the EPA failed to show why the cost-per-ton it found for storage vessel developments are inappropriate and failed to show why further reductions are not required to satisfy CAA sections 112(d)(6) and (f)(2). The commenter noted the costs the EPA found ($6,120 per ton HAP to $44,100 per ton HAP) are lower than other rules where the EPA determined the cost-per-ton to be appropriate. As an example, the commenter cited the cost-per-ton from secondary lead smelting that were considered reasonable, ranging from $330,000 per ton to $1,500,000 per ton (77 FR 576, January 5, 2012). The commenter stated that because the EPA found higher cost-reduction ratios appropriate, it is arbitrary and capricious for the EPA not to require greater reductions for storage vessels, when they are achievable and would provide more protection for public health, as statutorily provided. The commenter asserted that several of these developments are already widely in use or required by other regulatory agencies. The commenter further argued that the EPA gives no explanation for why the Agency considers ''incremental cost effectiveness'' to be determinative rather than evaluating costs based on ''HAP cost effectiveness'' as it does for other source types, such as equipment leaks and waste streams.

The commenter argued that the EPA's decision to make cost-per-ton the standard-setting criterion and to choose a number it deems unreasonable, without a rational explanation, is arbitrary and capricious. The commenter stated the cost-per-ton of HAP reduction does not indicate whether a stronger standard is feasible and does not consider whether the industry could bear the costs of additional controls. The commenter stated that the ethylene production industry generated $50.8 billion in revenue in 2016 and the EPA cannot plausibly claim that this industry cannot afford to implement the identified storage vessel developments. The commenter noted that cost-per-ton says nothing about health risk, and that a ton of HAP is a very large amount. The commenter stated that the risk assessment for this source category shows the pollutants emitted in ethylene production are known to be hazardous at an exposure level of micrograms or less, and the carcinogens emitted (*e.g.,* benzene, formaldehyde, naphthalene) have no safe level of exposure. In addition, the commenter asserted that no two HAP create the same health risks and that reducing tons of one pollutant does not produce the same benefit as reducing tons of another. The commenter added that the EPA should not base its final standards on cost effectiveness at all; the Agency's job is simply to determine the ''maximum'' degree of reduction that can be achieved considering cost, under CAA section 112(d)(2), and to assure an ''ample margin of safety to protect public health'' under CAA section 112(f)(2). The commenter stressed that if the EPA wishes to consider cost effectiveness in any meaningful sense, it cannot rely on the cost-per-ton, which says nothing about the true effectiveness of reducing emissions of highly toxic pollutants, in terms of public health—which is a key factor missing from the EPA's analysis. Thus, the commenter concluded it was arbitrary and capricious for the EPA to decide that it was not necessary to update the standards to account for storage vessel developments based on cost.

The commenter also contended the EPA may consider cost but CAA section 112(d)(6) does not authorize the EPA to refuse to update standards based on cost. The commenter stated the Court has recognized that developments are the core requirement, and if developments have occurred, the EPA must account for those. The commenter further claimed that the EPA should follow the plain text of CAA section 112(d)(2)–(3) and applicable precedent requiring explicit authorization to consider cost. The commenter stated the EPA's cost-focused analysis ignores the statutory objective of assuring the ''maximum'' achievable degree of emission reduction provided in CAA section 112(d)(2), as implemented through the technology review. The commenter stated that this analysis also ignores the statutory goal of protecting public health, per CAA section 112 (f)(2).

The commenter also stated that although the EPA initially considered tightening the threshold for storage vessel capacity from 95 m^3 to 38 m^3, the EPA proposed a threshold of 59 m^3 because it found that ''it would not be cost-effective for this particular storage vessel to add additional controls due to its infrequent use.'' The commenter contended that the EPA cannot set a higher capacity threshold simply based on the cost of installing a control on one affected vessel, especially without information or analysis.

Response: We disagree with the comment that the EPA has an obligation to review prior MACT determinations and recalculate MACT floors as part of each CAA section 112(d)(6) review given that this argument has been repeatedly rejected by the Court. See, *e.g., Nat'l Ass'n of Surface Finishing* v. *EPA,* 795 F.3d 1 (DC Cir. 2015); *Association of Battery Recyclers* v. *EPA,* 716 F.3d 667, 673 (DC Cir. 2013); *Natural Resources Defense Council* (*NRDC*) v. *EPA,* 529 F.3d 1077 (DC Cir. 2008). In the proposal we neither re-evaluated nor re-opened the MACT standard for storage vessels under CAA sections 112(d)(2) and (3) in this action. For storage vessels, the revisions we proposed were as a result of the RTR under CAA sections 112(d)(6) and (f)(2). As also explained at proposal, under section 112(d)(6), the EPA is to review the ''emission standards promulgated under'' CAA section 112(d)(2) and (3). The EPA has consistently posited that CAA section 112(d)(6) focuses on the review of developments that have occurred in a source category since the original promulgation of a MACT standard. Similarly, the EPA is to conduct a risk review that evaluates whether the emission limits—the ''standards promulgated pursuant to subsection (d),'' [CAA section 112(f)(2)(A)]—should be made more stringent to reduce the risk posed after compliance with the underlying MACT standard. Therefore, the EPA does not have an obligation in its technology and

residual risk review to consider ''hypothetical'' facilities that is, facilities that have yet to begin construction (or may never even be constructed or operate) and where air emissions from ethylene production operations are merely anticipated because said operations do not yet exist and facilities have yet to start up. As also previously discussed we are not finalizing these proposed revisions under CAA section 112(d)(6) because they are not cost effective. In addition, the proposed revisions have little to no impact on HAP emissions for the source category. With respect to the role of cost in our decisions under the technology review, we note that the Court has not required the EPA to demonstrate that a technology is ''cost-prohibitive'' in order not to require adopting a new technology under CAA section 112(d)(6); a simple finding that a control is not cost effective is enough. See *Association of Battery Recyclers, et al.* v. *EPA, et al.,* 716 F.3d 667, 673–74 (D.C. Cir. 2015) (approving the EPA's consideration of cost as a factor in its CAA section 112(d)(6) decision-making and the EPA's reliance on cost effectiveness as a factor in its standard-setting).

The commenter's comparison of cost-per-ton estimates against other rules and other requirements within this final rule is also misplaced. The commenter draws a comparison to an analysis for metal HAP in the Secondary Lead NESHAP RTR, where those costs per ton were determined to be within the range of metal HAP values for other CAA section 112 rules (see 77 FR 576, January 5, 2012). However, organic HAP are the issue of concern for storage vessels, and the EPA has historically used a different and significantly lower cost-effectiveness scale for organic HAP versus metal HAP due to their relative toxicity. Generally, for organic HAP, we consider a cost effectiveness of $10,000/ton or more to be near the upper end of what the EPA has traditionally considered to be cost effective for control for these particular type of HAP.

In addition, we disagree with the commenter that consideration of incremental cost effectiveness was an unreasonable approach for comparing differing strategies that build upon one another. We note that CAA section 112(d)(6) does not prescribe a methodology for the agency's costs analysis, and the EPA has sometimes presented cost/ton-reduced numbers in the supporting analyses for regulations that we issue. See for example, *Husqvarna AB* v. *EPA,* 254 F. 3d 195 at 200 (D.C. Cir. 2001) (''Because section 213 does not mandate a specific method of cost analysis, we find reasonable the EPA's choice to consider costs on the per ton of emissions removed basis.''). For storage vessels, we proposed to tighten the capacity and MTVP thresholds for control (known as option SV1 in our technology review memorandum) and also evaluated two other control options that built upon option SV1. Option SV1 was evaluated in concert with the two other options, including adding enhanced monitoring requirements (option SV2) and requiring EFR storage vessels to convert to IFR storage vessels via use of geodesic domes (option SV3). The costs are presented such that the overall HAP cost effectiveness for options SV2 and SV3 also include option SV1, while the incremental cost-effectiveness values for options SV2 and SV3 are the cost-effectiveness values only for requiring enhanced monitoring and only for requiring EFR storage vessels to convert to IFR storage vessels via use of geodesic domes, respectively. Simply put, the incremental cost-effectiveness values for options SV2 and SV3 do not include costs and emissions reductions for option SV1. The commenter did not provide additional details on costs or emissions reductions on these options; thus, we continue to believe these options are not cost-effective and are not finalizing them. An incremental cost-effectiveness analysis was not needed for equipment leaks or waste operations because we did not propose any revisions under our CAA section 112(d)(6) technology review for these emission sources. We also did not consider control options for these emission sources that would build upon each other and necessitate an evaluation of incremental costs and, thus, the HAP cost effectiveness for the options presented in those analyses are equivalent to the incremental cost-effectiveness values presented for options SV2 and SV3 for storage vessels. For further information on our technology review for storage vessels, see the technical memorandum, *Clean Air Act Section 112(d)(6) Technology Review for Storage Vessels Located in the Ethylene Production Source Category,* which is available in Docket ID Item No. EPA–HQ–OAR–2017–0357–0014.

Lastly, we disagree with the commenter that it was unreasonable to consider an infrequently used storage vessel with a capacity of 58 m^3 (*i.e.,* a storage vessel with a capacity within the threshold of 38 m^3 and 59 m^3, which we evaluated, but did not propose) with little emissions and an extremely high cost-effectiveness value for control in setting the size threshold for control in our SV1 option evaluated under our CAA section 112(d)(6) review. As explained in the technology review memorandum, we first looked at other chemical sector and refinery NESHAP for storage vessel control thresholds for capacity and MTVP as a starting point and then we used our CAA section 114 ICR data to further refine option SV1. Based on our CAA section 114 data, only one storage vessel (with a capacity of 58 m^3) met the most stringent requirements for control from other NESHAP compared to the option we evaluated and would be impacted were we to evaluate this storage vessel in option SV1 (along with the other 12 storage vessels we anticipated would also be affected at proposal). Using the information from our CAA section 114 request that was submitted for this storage vessel (*e.g.,* size, number of tank turnovers, stored material composition), we conservatively estimated that this 58 m^3 storage vessel would only have annual emissions of 0.005 tpy of HAP if it had one full turnover (even though it reported having none in 2013). Considering the extreme case that all these emissions would be reduced from this storage vessel if it were required to be controlled, and if we made several other assumptions (*e.g.,* retrofit with an IFR, 12-foot diameter tank, one of each of the various upgraded deck fittings), we determined that controlling this one storage vessel would have an annualized cost of approximately $5,550 per year and not be cost effective (*i.e.,* over $1,000,000 per ton of HAP). We note that this information was available in the docket for commenters to use and provide their own estimates of HAP emissions and costs for control for this storage vessel. When considering this information, we find the option to tighten the capacity and MTVP thresholds to be even less cost effective if you consider impacts requiring control from the 58 m^3 storage vessel. Thus, as previously discussed, we are not finalizing the proposed capacity and MTVP thresholds we proposed for storage vessels and are keeping the current MACT level of control for storage vessels in place.

Comment: We received comments in support of and against the proposal to require use of the Modified El Paso Method for repairing leaks in heat exchange systems. A commenter that supported the proposal noted that at least eight facilities in the source category were already using the Modified El Paso Method. On the other hand, some commenters said the EPA's proposed control requirements for heat

exchange systems were not cost effective when considering the actual costs to repair leaks. A commenter said that the costs provided in Table 7 of the memorandum, *Clean Air Act Section 112(d)(6) Technology Review for Heat Exchange Systems Located in the Ethylene Production Source Category,* significantly underestimates the true cost associated with leak repair at ethylene production facilities. The commenter contended that for purposes of leak repair, after identifying a leak, maintenance and operations personnel must develop a strategy and schedule to remove the leaking exchanger from service, which involves identifying and selecting options for: Bypassing the process stream from the leaking system, the amount of production turndown necessary while the exchanger is out of service, identifying and selecting the appropriate contract personnel, and scheduling the work so that it does not conflict with any other planned maintenance. According to the commenter, several different personnel would be involved in these planning tasks including management, maintenance, production, and engineering staff (128 hour estimate is based on 32 hours × 4 persons). In addition to these planning costs, the commenter said that the EPA did not include costs for bypassing the leaking system to avoid a total shutdown which may include renting and plumbing temporary heat exchangers. The commenter also said that the EPA did not include costs for the rental and installation of cranes and scaffolding for accessing the heat exchanger for repairs, and costs for specialized contracted maintenance support to de-head the exchanger and perform the repair. Based on maintenance records, the commenter contended that repair costs range from $200,000 to $400,000 per event, not considering lost profit due to turndown or shutdown of the production unit. Factoring in these additional costs and using the EPA's estimated HAP emissions reductions of 25 tpy, the commenter said the revised cost effectiveness becomes $16,200 per ton of HAP. The commenter cited the RTR for Friction Materials Manufacturing Facilities (83 FR 19511, May 3, 2018) where the EPA found that $3,700 per ton for a permanent total enclosure was not cost effective, and the RTR for the Petroleum Refinery Sector (79 FR 36916, June 30, 2014) where the EPA found that $14,100 per ton for lowering leak definitions was not cost effective. The commenter also said that in cases where the leaking heat exchanger must be completely replaced to fix the leak, the costs exceed $1 million. The commenter stated that the EPA acknowledged in the preamble that emissions from heat exchange systems have an overall small contribution to cancer risk to the individual most exposed and that additional controls for heat exchange systems are not necessary to provide an ample margin of safety.

Response: We disagree with commenters that said the proposed requirements for heat exchange systems to use the Modified El Paso Method and a leak definition of 6.2 ppmv of total strippable hydrocarbon concentration (as methane) in the stripping gas are not cost-effective. We are finalizing this proposed development under CAA section 112(d)(6) with some minor technical clarifications that are discussed elsewhere in the rulemaking record (see our response in this preamble to commenters' requests to include an alternative mass-based leak definition; also see the document, *Summary of Public Comments and Responses for the Risk and Technology Review for Ethylene Production,* which is available in Docket ID No. EPA–HQ–OAR–2017–0357). We note that the existing MACT standards that were finalized in 2002 (67 FR 46258, July 12, 2002) contained LDAR provisions and many of the items commenters include in their cost estimates are associated with repair costs that would have already been incurred under the existing MACT standards. These repair costs include, but are not limited to, planning, bypassing, various equipment rental costs, costs for scaffolding, and deheading. We also disagree with commenter's cost estimates because most of the items that they claim are associated with the proposed revision will not be required by this final rule requirement (*i.e.,* we determined that the costs associated with the difference between conducting leak sampling using water sampling methods and leak sampling using the Modified El Paso Method as well as costs associated with combined operator and maintenance labor to find and repair a leak by plugging are the only costs that would be additionally incurred by the technology review standards). Further, commenters failed to provide enough information demonstrating why their costs information represents leak repair costs for an average heat exchange system at an ethylene production facility. For example, facilities may have additional heat exchange system capacity available at their facility and may opt to use this capacity to repair the leak, at no additional expense, yet this was not considered by commenters. Also, commenters did not provide additional information for us to evaluate the percentage of time additional leaks would have to be fixed under the revised heat exchange system standards proposed under technology review compared to the original MACT standards. Thus, we continue to believe that the majority, if not all of the repair costs cited by commenters would have been accounted for and incurred as a result of the existing MACT standards and that simply plugging a leaking heat exchanger would more likely represent the average cost additionally incurred by ethylene production sources as a result of this technology review development. In addition, in the proposed rule we explained that we considered a heat exchanger to effectively be at the end of its useful life if it was leaking to such an extent that it would need to be replaced in order to comply with the requirement; so the cost of replacing the heat exchanger would be an operational cost that would be incurred by the facility as a result of routine maintenance and equipment replacement and not attributable to the proposed work practice standard that is being finalized in this action (see the technical memorandum, *Clean Air Act Section 112(d)(6) Technology Review for Heat Exchange Systems in the Ethylene Production Source Category,* which is available in Docket ID No. EPA–HQ–OAR–2017–0357). Thus, given all of this information, we continue to believe that those costs associated with the difference between conducting leak sampling using water sampling methods and leak sampling using the Modified El Paso Method as well as costs associated with combined operator and maintenance labor to find and repair a leak by plugging are the only costs that would be additionally incurred by the technology review standards. Based on our analysis, we find that the revised standards we proposed for heat exchange systems are cost effective at $1,060 per ton of HAP without consideration of product recovery and result in a cost savings when you consider product recovery. Therefore, we are finalizing the revisions for heat exchange systems that we proposed under CAA section 112(d)(6) with some minor technical clarifications that are discussed elsewhere in this preamble and in the document, *Summary of Public Comments and Responses for the Risk and Technology Review for Ethylene Production,* which is available in Docket ID No. EPA–HQ–OAR–2017–0357.

Additionally, with respect to rules where we have determined that

requirements are not cost effective at varying levels of cost effectiveness, we note that there can be other compelling factors beyond cost effectiveness that play a role in the EPA's determinations and that each rulemaking is unique and should be judged on its own merits. With respect to the two proposed rules commenters cited, we note that different determinations likely would have resulted if some of the other variables in those rulemaking records were not considered, such as for the Friction Materials RTR (83 FR 19511, May 3, 2018) where no facilities in the source category would have been impacted by rule revisions under the technology review due to process changes and use of non-HAP solvents. Similarly, for the Petroleum Refinery RTR (79 FR 36916, June 30, 2014), consideration of other fugitive emissions management techniques that were finalized (*e.g.,* fenceline monitoring) also had the potential to help control equipment leaks in the Petroleum Refinery source category. Regardless, and as stated above, we believe that the developments we identified for heat exchange systems used in the Ethylene Production source category are cost effective and are finalizing these revisions under CAA section 112(d)(6).

Comment: Some commenters recommended the EPA revise 40 CFR 63.1086(e)(i) through (iii) to include an alternative mass-based leak definition. Commenters argued that by only defining a leak on a concentration basis, smaller facilities with lower heat exchange system recirculation rates would be forced to identify and fix leaks with a much lower potential HAP emissions rate than facilities with larger recirculation systems.

A commenter said the EPA should calculate the equivalent mass-based emission rate using the 90th percentile heat exchange system recirculation rates (165,000 gpm) and the leak definition of 6.2 ppmv as methane in the stripping gas, assuming 100 percent of the hydrocarbon is hexane, for an equivalent mass leak-based leak definition of 6.1 pounds per hour (2.8 kilograms per hour) of Table 1 to 40 CFR part 63, subpart XX HAP.

Another commenter said the EPA should modify the leak action level to be defined as potential strippable hydrocarbon emissions greater than 4.0 pounds per hour for heat exchange systems with a recirculation flowrate less than or equal to 100,000 gpm. The commenter asserted that the memorandum, *CAA Section 112(d)(6) Technology Review for Heat Exchangers Located in the Ethylene Production Source Category,* mentions one case where the concentration of methane was 6.1 ppmv in the gas phase and just less than 80 parts per billion by weight (ppbw) in the water phase, thus, resulting in emissions of 0.64 pounds per hour based on a recirculation rate of 17,000 gpm. Using this information, the commenter determined that an average cooling water system with a recirculation rate of 100,000 gpm (the average cooling water recirculation rate of the ethylene production industry based on the responses the EPA received to the CAA section 114 ICR) and a concentration of strippable hydrocarbons in the water of 80 ppbw, will have potential strippable hydrocarbon emissions of 4 pounds per hour.

A commenter also recommended the EPA adjust the ''delay of repair'' leak action level in 40 CFR 63.1088(d)(3) to 40 pounds per hour of potential strippable hydrocarbon emissions for heat exchange systems with a recirculation rate of 100,000 gpm or less, and maintain the ''delay of repair'' action level at a total strippable hydrocarbon concentration (as methane) in the stripping gas of 62 ppmv (approximately 800 ppbw in the cooling water) for heat exchange systems with a recirculation rate greater than 100,000 gpm.

Response: We agree with commenters that an alternative mass-based leak action level is warranted, and that by not finalizing such an alternative, smaller heat exchange systems with low recirculation rates would be disproportionally affected and forced to repair leaks with a much lower potential HAP emissions rate than facilities with larger recirculation rate systems. We disagree with commenters, however, that the foundation of the alternative mass-based leak action level should be based on the average recirculation rate in the source category of 100,000 gpm or the 90th percentile heat exchange system recirculation rate of 165,000 gpm. As commenters allude to, the goal of this alternative is to not disproportionally impact small heat exchange systems with low emissions potential. To that end and given that this is a technology review under CAA section 112(d)(6), consideration of where it is cost-effective to repair a leaking heat exchange system should be a primary consideration for this alternative. In our technology review memorandum, *Clean Air Act Section 112(d)(6) Technology Review for Heat Exchange Systems Located in the Ethylene Production Source Category,* at Docket ID Item No. EPA–HQ–OAR–2017–0357–0011, the nationwide impacts and emissions reductions presented in Tables 15 and 16 are used to determine the HAP cost effectiveness for the source category on average. In other words, the nationwide impacts for HAP cost effectiveness (without consideration of product recovery) at $1,060/ton of HAP would be the HAP cost effectiveness for an average heat exchange system in the source category that has a recirculation rate of approximately 100,000 gpm. We also generally consider that technology review developments are not cost effective for organic HAP if the cost effectiveness is more than $10,000/ton (or approximately 10 times higher than the cost effectiveness estimated for the average heat exchange system at ethylene production sources). Since the recirculation rate directly correlates to mass emissions potential at the same leak concentration, the mass emissions for a heat exchange system with recirculation rate of 10,000 gpm or less would be at least 10 times smaller compared to a 100,000 gpm recirculation rate system and the annual costs to find and repair leaks would not change. As such, we determined that it is not cost effective to control leaks at the leak action level of total strippable hydrocarbon of 6.2 ppmv (as methane) for heat exchange systems with a recirculation rate of 10,000 gpm or less, because the HAP cost effectiveness would be approximately $10,000/ton of HAP or more. Therefore, to alleviate the concern about disproportionally impacting small heat exchange systems with low HAP emissions potential, and to ensure our technology review developments are cost effective for all heat exchange systems in the source category, we are finalizing an alternative total hydrocarbon mass-based emissions rate leak action level (as methane) of 0.18 kilograms per hour (0.4 pounds per hour) for heat exchange systems in the Ethylene Production source category that have a recirculation rate of 10,000 gpm or less. We also agree that for consistency, and to not disproportionately impact small heat exchange systems, that an alternative mass-based leak action level of 1.8 kilograms per hour (4.0 pounds per hour) for delay of repair for heat exchange systems with a recirculation rate of 10,000 gpm or less is warranted.

4. What is the rationale for our final approach for the technology review?

Our technology review focused on the identification and evaluation of developments in practices, processes, and control technologies that have occurred since the EMACT standards were originally promulgated on July 12, 2002 (67 FR 46258). Specifically, we

focused our technology review on all existing MACT standards for the various emission sources in the Ethylene Production source category, including, storage vessels, ethylene process vents, transfer racks, equipment leaks, waste streams, and heat exchange systems. In the proposal, we only identified cost-effective developments for storage vessels and heat exchange systems and proposed to tighten the standards for these two emissions sources under technology review. We did not identify developments in practices, processes, or control technologies for ethylene process vents, transfer racks, equipment leaks, and waste streams. Further rationale about the technology review can be found in the proposed rule (84 FR 54278, October 9, 2019) and in the supporting materials in the rulemaking docket at Docket ID No. EPA–HQ–OAR–2017–0357.

During the public comment period, we received several comments on our proposed determinations for the technology review. The comments and our specific responses and rationale for our final decisions can be found in section IV.B.3 of this preamble and in the document, *Summary of Public Comments and Responses for the Risk and Technology Reviews for the Ethylene Production Source Category,* available in the docket for this action. No information presented by commenters has led us to change our proposed determination, under CAA section 112(d)(6) for ethylene process vents, transfer racks, equipment leaks, and waste streams, and we are finalizing our determination that no changes to these standards are warranted. Substantive information was submitted by commenters on proposed revisions for heat exchange systems, and based on this information, we are finalizing revisions for heat exchange systems and making some technical clarifications to allow compliance with an alternative mass-based leak action level for small heat exchange systems with a recirculation rate of 10,000 gpm or less in lieu of the concentration-based leak action level that was proposed. Lastly, for storage vessels, substantive information was also submitted by commenters, and based on this additional information, we find that the developments we proposed are not cost effective for this emissions source. Thus, we are not finalizing any changes for storage vessels as a result of the technology review.

C. Amendments Pursuant to CAA Section 112(d)(2) and (d)(3) for the Ethylene Production Source Category

1. What did we propose pursuant to CAA section 112(d)(2) and (3) for the Ethylene Production source category?

Under CAA section 112(d)(2) and (3) we proposed to amend the operating and monitoring requirements for flares used as APCDs in the Ethylene Production source category to ensure that facilities that use flares as APCDs meet the EMACT standards at all times when controlling HAP emissions. We proposed to add a provision, 40 CFR 63.1103(e)(4), to extend the application of the Petroleum Refinery Flare Rule requirements in 40 CFR part 63, subpart CC to flares in the Ethylene Production source category with clarifications, including, but not limited to, specifying that several definitions in 40 CFR part 63, subpart CC, that apply to petroleum refinery flares also apply to flares in the Ethylene Production source category, adding a definition and requirements for pressure-assisted multi-point flares, and specifying additional requirements when a gas chromatograph or mass spectrometer is used for compositional analysis. Specifically, we proposed to retain the General Provisions requirements of 40 CFR 63.11(b) and 40 CFR 60.18(b) that flares used as APCDs in the Ethylene Production source category operate pilot flame systems continuously and that flares operate with no visible emissions (except for periods not to exceed a total of 5 minutes during any 2 consecutive hours) when the flare vent gas flow rate is below the smokeless capacity of the flare. We also proposed to consolidate measures related to flare tip velocity and new operational and monitoring requirements related to the combustion zone gas. Further, in keeping with the elimination of the SSM exemption, we proposed a work practice standard related to the visible emissions and velocity limits during periods when the flare is operated above its smokeless capacity (*e.g.,* periods of emergency flaring). We proposed eliminating the cross-references to the General Provisions and instead to specify all operational and monitoring requirements that are intended to apply to flares used as APCDs in the Ethylene Production source category.

In addition, we proposed provisions and clarifications for periods of SSM and bypasses, including PRD releases, bypass lines on closed vent systems, in situ sampling systems, maintenance activities, and certain gaseous streams routed to a fuel gas system to ensure that CAA section 112 standards apply continuously, consistent with *Sierra Club* v. *EPA* 551 F. 3d 1019 (D.C. Cir. 2008). For PRD releases, we proposed at 40 CFR 63.1103(e)(2) definitions of ''pressure relief device'' and ''relief valve'' and proposed to add a work practice standard at 40 CFR 63.1107(h)(3), (6), and (7) for PRDs that vent to atmosphere that requires three prevention measures and root cause analysis and corrective action when a release occurs.[4] We proposed to require that sources monitor PRDs that vent to the atmosphere using a system that is capable of identifying and recording the time and duration of each pressure release and of notifying operators that a pressure release has occurred. We also proposed to add a provision, 40 CFR 63.1107(h)(4), to require PRDs that vent through a closed vent system to a control device or to a process, fuel gas system, or drain system meet minimum requirements for the applicable control system. In addition, we proposed to add a provision, 40 CFR 63.1107(h)(5), to exclude the following types of PRDs from the work practice standard for PRDs that vent to the atmosphere: (1) PRDs with a design release pressure of less than 2.5 pounds per square inch gauge (psig); (2) PRDs in heavy liquid service; (3) PRDs that are designed solely to release due to liquid thermal expansion; and (4) pilot-operated and balanced bellows PRDs if the primary release valve associated with the PRD is vented through a control system. Finally, we proposed to add a provision, 40 CFR 63.1107(h)(8), to require future installation and operation of non-flowing pilot-operated PRDs at all affected sources.

For bypass lines on closed vent systems, we proposed to add a provision, 40 CFR 63.1103(e)(6), to not allow an owner or operator to bypass the APCD at any time, and if a bypass is used, then the owner or operator is to estimate and report the quantity of organic HAP released. We proposed this revision to be consistent with *Sierra Club* v. *EPA,* 551 F.3d 1019 (D.C. Cir. 2008), where the Court determined that standards under CAA section 112(d) must provide for compliance at all times, because bypassing an APCD could result in a release of regulated organic HAP to the atmosphere. We also proposed that the use of a cap, blind flange, plug, or second valve on an

[4] Examples of prevention measures include flow indicators, level indicators, temperature indicators, pressure indicators, routine inspection and maintenance programs or operator training, inherently safer designs or safety instrumentation systems, deluge systems, and staged relief systems where the initial PRD discharges to a control system.

open-ended valve or line is sufficient to prevent a bypass. For in situ sampling systems, we proposed to delete the exclusion of ''in situ sampling systems (online analyzers)'' from the definition of ''ethylene process vent'' and require that these kinds of vents meet the standards applicable to ethylene process vents at all times.

For maintenance activities, we proposed a definition for ''periodically discharged'' and removed ''episodic or nonroutine releases'' from the list of vents not considered ethylene process vents. We proposed to add a work practice standard at 40 CFR 63.1103(e)(5) requiring that, prior to opening process equipment to the atmosphere, the equipment either: (1) Be drained and purged to a closed system so that the hydrocarbon content is less than or equal to 10 percent of the lower explosive limit (LEL); (2) be opened and vented to the atmosphere only if the 10-percent LEL cannot be demonstrated and the pressure is less than or equal to 5 psig, provided there is no active purging of the equipment to the atmosphere until the LEL criterion is met; (3) be opened when there is less than 50 pounds of VOC that may be emitted to the atmosphere; or (4) for installing or removing an equipment blind, depressurize the equipment to 2 psig or less and maintain pressure of the equipment where purge gas enters the equipment at or below 2 psig during the blind flange installation, provided none of the other proposed work practice standards can be met. For cases where an emission source is required to be controlled in the EMACT standards but is routed to a fuel gas system, we proposed to add footnote b to Table 7 of 40 CFR 63.1103(e) to require that any flare, utilizing fuel gas whereby the majority (*i.e.,* 50 percent or more) of the fuel gas in the fuel gas system is derived from an ethylene production unit, comply with the proposed flare operating and monitoring requirements.

We proposed to add work practice standards at 40 CFR 63.1103(e)(7) and (8) to address the decoking of ethylene cracking furnaces (*i.e.,* the coke combustion activities in an ethylene cracking furnace), which is defined as a shutdown activity and was previously only required to minimize emissions by following a startup, shutdown, malfunction plan. This ensures that CAA section 112 standards apply continuously. To minimize coke combustion emissions from the decoking of the radiant tube(s) in each ethylene cracking furnace, we proposed that an owner or operator must conduct daily inspections of the firebox burners and repair all burners that are impinging on the radiant tube(s) as soon as practical, but not later than 1 calendar day after the flame impingement is found. We also proposed that an owner or operator conduct two of the following activities: (1) Continuously monitor (or use a gas detection tube every hour to monitor) the CO_2 concentration at the radiant tube(s) outlet for indication that the coke combustion in the ethylene cracking furnace radiant tube(s) is complete; (2) continuously monitor the temperature at the radiant tube(s) outlet to ensure the coke combustion occurring inside the radiant tube(s) is not so aggressive (*i.e.,* too hot) that it damages either the radiant tube(s) or ethylene cracking furnace isolation valve(s); (3) after decoking, but before returning the ethylene cracking furnace back to normal operations, purge the radiant tube(s) with steam and verify that all air is removed; or (4) after decoking, but before returning the ethylene cracking furnace back to normal operations, apply a coating material to the interior of the radiant tube(s) to protect against coke formation inside the radiant tube during normal operation. In addition, we proposed that the owner or operator must conduct the following inspections for ethylene cracking furnace isolation valve(s): (1) Prior to decoking operation, inspect the applicable ethylene cracking furnace isolation valve(s) to confirm that the radiant tube(s) being decoked is completely isolated from the ethylene production process so that no emissions generated from decoking operations are sent to the ethylene production process; and (2) prior to returning the ethylene cracking furnace to normal operations after a decoking operation, inspect the applicable ethylene cracking furnace isolation valve(s) to confirm that the radiant tube(s) that was decoked is completely isolated from the decoking pot or furnace firebox such that no emissions are sent from the radiant tube(s) to the decoking pot or furnace firebox once the ethylene cracking furnace returns to normal operation.

More information concerning our proposal to address CAA section 112(d)(2) and (3) can be found in the proposed rule (84 FR 54278, October 9, 2019).

2. How did the revisions pursuant to CAA section 112(d)(2) and (3) change since proposal?

The EPA is finalizing the revisions to the monitoring and operational requirements for flares, as proposed, except that we are not finalizing the work practice standard for velocity exceedances for flares operating above their smokeless capacity. In response to comments that owners or operators have historically considered degassing emissions from shutdown of storage vessels to be covered by their SSM plans per 40 CFR 63.1108(a)(5) and relied on the language in 40 CFR 63.1108(a)(5) that back-up control devices are not required, we are adding a separate standard for storage vessel degassing for storage vessels subject to the control requirements in Table 7 to 40 CFR 63.1103(e)(3)(b) and (c). The standard requires owners or operators to control degassing emissions for floating roof and fixed roof storage vessels until the vapor space concentration is less than 10 percent of the LEL. Storage vessels may be vented to the atmosphere once the storage vessel degassing concentration threshold is met (*i.e.,* 10 percent LEL) and all standing liquid has been removed from the vessel to the extent practical.

Lastly, based on comments received on the proposal, we are making some minor editorial corrections and technical clarifications to the work practice standards for the decoking of ethylene cracking furnaces. Specifically, we are adding delay of repair provisions to the flame impingement inspection requirements, adding clarifying text to the CO_2 monitoring, coil outlet temperature monitoring, air removal, and radiant tube(s) treatment requirements, and removing unnecessary recordkeeping associated with the time each isolation valve inspection is performed and the results of that inspection even if poor isolation was not found. For details about these minor changes, refer to Section 6.7 of the document, *Summary of Public Comments and Responses for the Risk and Technology Reviews for the Ethylene Production Source Category,* available in the docket for this action.

3. What key comments did we receive on the proposal revisions pursuant to CAA section 112(d)(2) and (3), and what are our responses?

This section provides comment and responses for the key comments received regarding our proposed revisions for flares and clarifications for periods of SSM, including PRD releases, decoking operations for ethylene cracking furnaces (*i.e.,* the decoking of ethylene cracking furnace radiant tubes), and storage vessel emptying and degassing. Other comment summaries and the EPA's responses for additional issues raised regarding these activities as well as issues raised regarding our proposed revisions for bypass lines on closed vent systems, in situ sampling systems, maintenance activities, and certain gaseous streams routed to a fuel gas system, can be found in the

document, *Summary of Public Comments and Responses for the Risk and Technology Reviews for the Ethylene Production Source Category,* available in the docket for this action.

Comment: We received comments in support of and against our proposal to establish similar requirements for flares used in the Ethylene Production source category as the flare requirements established in the 2015 Petroleum Refinery NESHAP, including the incorporation of the net heating value of the combustion zone (NHVcz) calculation and limits. One commenter supported the proposed strengthened operational and monitoring requirements, which the commenter stated reflect best practices already in place at many facilities and must be required pursuant to CAA sections 112(d)(2), (3), and (6). The commenter reiterated the EPA's determination that measuring the net heating value of the flare gas, as it enters the flares, is insufficient to determine combustibility because facilities add steam and other gases not accounted for and that flare performance data shows that the net heating value of vent gas in the combustion zone must reach at least 270 British thermal units per standard cubic foot (Btu/scf). Some commenters also supported the EPA's proposal ''that owners or operators may use a corrected heat content of 1,212 Btu/scf for hydrogen, instead of 274 Btu/scf, to demonstrate compliance with the NHVcz operating limit,'' because the data show that the control efficiency of a flare drops off significantly below this level.

Another commenter also suggested other improvements to the proposed flared revisions. According to this commenter, data shows the proposed rule does not assure heating values in the combustion zone that are high enough to achieve the EMACT standards. The commenter said that the EPA has an extensive record to support its conclusion that some ethylene production facility flares do not destroy at least 98 percent of HAP, and urged the EPA to mandate additional measures to ensure 98-percent flare destruction efficiency. The commenter noted that at least one operator, Formosa, recognizes that flares can achieve 99-percent reduction in HAP emissions for small molecules.[5] The commenter stated that continuous monitoring of either the net heating value or composition of flare gas must be required pursuant to CAA sections 112(d)(2), (3), and (6). The commenter recommended that the EPA also consider the following measures to help assure compliance with 98-percent destruction efficiency:

- Prohibit wake dominated flow flaring conditions. The commenter noted that studies have shown that high winds can decrease flare destruction efficiency.[6]
- Require continuous video monitoring and recording for flares equipped with video monitoring and flares that vent more than 1 million standard cubic feet scf per day (MMscf/day).[7]
- Require monitoring of pilot gas, which is already required by the South Coast Air Quality Management District (SCAQMD) and Bay Area Air Quality Management District (BAAQMD).

The commenter also stated that the EPA should require that facilities conduct necessary flare maintenance and upgrades and have additional flare capacity on standby. The commenter stated that if a flare is smoking, that may mean it simply needs to be either maintained or updated to address the problem. The commenter recommended add-on equipment to augment the smokeless capacity of a flare.[8] The commenter also said that the EPA neither explained why other types of conveyances are not possible, nor can the EPA justify a standard that exempts equipment routed to a flare from the standards that generally apply to such equipment.

Response: We appreciate the support from several commenters for the flare operational and monitoring requirements being finalized at 40 CFR 63.1103(e)(4). However, we disagree with one commenter's request to mandate additional measures to ensure 98-percent flare combustion efficiency. The flare requirements we are finalizing are already designed to ensure flares meet a minimum destruction efficiency of 98 percent, consistent with the MACT control requirements.

We disagree with the commenter's specific request to prohibit wake dominated flow flaring conditions as we have extremely limited data to suggest that wind adversely impacts the combustion efficiency of flares, let alone the combustion efficiency of industrial-sized flares used at ethylene production units. Commenters submitted no new data to otherwise support the assertion that wind does indeed affect flare performance, and, as such, we are not persuaded into changing our position at proposal that no flare operating parameter(s) are needed to minimize wind effects on flare performance.

We disagree with the commenter's specific request to require continuous video monitoring and recording for flares equipped with video monitoring and flares that vent more than 1 MMscf/day. We note that in the final rule we have provided for the use of video camera surveillance monitoring as an alternative to EPA Method 22 monitoring. Observation via the video camera feed can be conducted readily throughout the day and will allow the operators of the flare to watch for visible emissions at the same time they are adjusting the flare operations.

We also disagree with the commenter's specific request to require monitoring of pilot gas. The data available to us suggests that heat release from the flare pilots are generally negligible when regulated materials are sent to the flare and exclusion of the flare pilot gas simplifies the NHVcz calculation. Even when only purge gas is used, the flare pilots typically only provided about 10 percent of the total heat input to the flare and typically well less than 1 percent in the recent passive fourier transform infrared spectrometry flare tests when potential regulated material is routed to the flare (this is dependent on the size of the flare, number of pilots, and flare tip design, which impacts minimum purge flows). We are finalizing the definition of flare vent gas as proposed, which excludes pilot gas.

Also, we disagree with the commenter's specific request to require additional flare capacity on standby to avoid a smoking flare because it would require new additional flares to operate at idle conditions for the vast majority

(July 10, 2013); Consent Decree, *United States of America* v. *Flint Hills Resources Port Arthur, LLC,* No. 14–cv–0169, at 12 (E.D. Tex.) (March 20, 2014).

[8] The commenter provided the following reference: John Zink Hamworthy, Smokeless, Safe, Economical Solutions: Refining & Petrochemical Flares. Pg. 4 (this technology can increase the smokeless capacity of a flare by nearly 38 percent), available at *http://www.johnzink.com/wp-content/uploads/Flares-Refining-Petrochemical.pdf.*

of time, contributing to additional criteria pollutant emissions on a continuous basis, while having only a small impact on HAP emissions. For example, an existing flare burns approximately 25,000 to 100,000 standard cubic feet per day of natural gas (or fuel gas). If three new flares are added for each existing flare to ensure flares do not smoke during emergency shutdowns or other similar major events, then the additional emissions per existing flare would be 1,000 to 4,100 megagrams per year of CO_2 equivalence and 0.9 to 3.6 tpy of nitrogen oxides. This estimate does not include emissions from the generation of the extra steam needed for these flares to operate in a smokeless manner during the emission events. Therefore, the secondary impacts associated with having greater smokeless flare capacity would be significant. In addition, it is not clear whether the specific technology that the commenter cited to augment the smokeless capacity of a flare (*i.e.,* a specific steam-assisted flare system that uses multiple-port supersonic nozzle technology) is an ''add-on'' technology, nor did the commenter provide any data to quantify or substantiate the claims, or any other additional details on costs or emissions reductions for it.

Finally, the commenter did not provide any context regarding their comment about other types of conveyances and justifying standards; therefore, we are unable to respond to this portion of the comment.

Comment: A commenter stated that the EPA improperly based the proposed flare revisions on CAA sections 112(d)(2) and (3) and should have evaluated them under CAA section 112(d)(6). The commenter stated that in setting the original MACT, the EPA did not have actual data demonstrating that the best performers were achieving 98-percent HAP reduction with flares (and other combustion devices), but rather based its conclusions on what it presumed sources would achieve if a combustion device were operated consistent with the requirements in the rule. The commenter further stated that the EPA is now claiming that 98-percent HAP reduction was not achieved in practice by the best performers, and instead can only be achieved by the best performers if they take additional steps to reduce emissions (*e.g.,* meet NHVcz requirements and implement additional monitoring). The commenter contended the proposed flare revisions can only be either a BTF standard or a revision as a result of the technology review, and the EPA cannot make the standard more stringent simply by claiming it is ensuring compliance with the current standard.

The commenter argued the EPA should have evaluated the flare revisions under CAA section 112 (d)(6), found the revisions were not cost effective, and not proposed the flare revisions. To support the commenter's contention that the proposed flare requirements would not be cost effective, the commenter provided updated estimates for the costs presented in Tables 3, 6, and 7 of the EPA memorandum, *Control Option Impacts for Flares Located in the Ethylene Production Source Category.* The commenter made the following statements regarding costs:

- The EPA did not consider the cost of constructing new flares at existing facilities to meet the proposed requirements. The commenter stated that they know that at least one company would be required under the proposed rule to install at least two new flares, due to the high potential for existing flares to exceed the number of visible emissions events allowed, with a capital cost of $20 million and annualized costs of $3.1 million.
- Gas chromatographs would need to be installed in certain instances to comply with the proposed monitoring requirements, which the commenter suggests would have an estimated nationwide capital investment of $964,000 and annualized costs of $140,000 for installation and operation.
- The EPA did not account for the costs associated with upgrading natural gas controls and flow monitoring; the commenter estimated approximately 47 flares will require upgraded supplemental fuel controls and monitoring equating to a nationwide capital investment of $5.3 million and an annualized cost of approximately $1 million.
- The EPA did not account for supplemental natural gas firing to meet the revised NHVcz operating parameter, which the commenter estimates would cost approximately $66.8 million per year in additional operating costs.
- The EPA underestimated the costs to develop the flare management plan by inappropriately relying on the cost estimated for refineries. However, most refineries were subject to similar flare management plan requirements under 40 CFR part 60, subpart Ja, and, therefore, were only required to update existing plans, whereas the commenter said ethylene producers will generally be required to develop new flare management plans. The commenter estimated the cost to develop a new flare management plan is $23,300 per flare.
- The EPA did not include the cost to develop the continuous parametric monitoring system monitoring plan required by 40 CFR 63.671(b), which they estimate is an additional $7,400 per flare to develop.

Using their updated costs and the EPA's estimated 1,430 tpy of HAP reductions, the commenter stated that the cost effectiveness of the proposed flare requirements would be $55,874 per ton of HAP reduced. The commenter argued that the EPA would have found the proposed flare revisions not cost effective under CAA section 112(d)(6) and, therefore, would not have included the changes in the proposed rule.

Another commenter stated there would be complications complying with the proposed flare revisions, which would further increase the cost of the proposal, including: (1) When gas chromatographs are currently in use, some flares will need to add calorimeters to directly measure the net heating value on a minute-by-minute basis to help with process control and meet the requirements on a 15-minute basis; (2) some flares have multiple vent gas lines entering the flare system (*e.g.,* a line to the base of the flare and a line entering the side of the flare stack) and additional vent gas monitors will be needed; (3) some flares have two or more steam lines to the flare tip and additional steam flow monitors will be needed; and (4) some flares will need to install larger volume supplemental fuel lines, triggering the need for permitting and construction of these systems.

Response: We disagree with the commenter that the flare revisions should have been evaluated and proposed under CAA section 112(d)(6). As explained at proposal, we are not revising the MACT standards, which generally require 98-percent control efficiency and allow an owner or operator to choose the control device to meet the standard. Rather, we determined the flare operating and monitoring requirements were not adequate to ensure that 98-percent control efficiency can be met for a flare at all times. (84 FR 54294). As a general matter, available flare test data indicates that flares can achieve 99.9-percent control at certain times, and we believe that the long term nationwide average control efficiency achieved by flares meeting the final rule requirements could be over 98-percent control efficiency. In fact, in the development of the EMACT standards, the EPA stated that ''It is generally accepted that combustion devices achieve a 98 weight-percent reduction in HAP emissions . . .'' (65 FR 76428, December 6, 2000). However, in this

rulemaking, we are acknowledging that there are instances, particularly when either assist steam or assist air is used, where flare performance is degraded, and this level of control is not achieved at all times. Since the revisions ensure continuous compliance with the MACT standards, under CAA sections 112(d)(2) and (3), costs are not a factor considered for these revisions. *NRDC* v. *EPA,* 529 F.3d 1077, 1084 (D.C. Cir. 2008) (''EPA may not consider costs in setting the maximum achievable control technology 'floors,' but only in determining whether to require 'beyond the floor' reductions in emissions.''); *NRDC* v. *EPA,* 489 F.3d 1364, 1376 (D.C. Cir. 2007 (''[C]ost is not a factor that EPA may permissibly consider in setting a MACT floor.''); see also, *Nat'l Lime Ass'n* v. *EPA,* 233 F.3d 625, 640 (D.C. Cir.2000)). At proposal, we acknowledged that some additional instrumentation and supplemental fuel may be needed for some flares and included cost estimates for these items. In addition, as previously explained, the EPA has no obligation to review prior MACT determinations and recalculate MACT floors as part of each CAA section112(d)(6) review. See, *e.g., Nat'l Ass'n of Surface Finishing* v. *EPA,* 795 F.3d 1 (D.C. Cir. 2015); *Association of Battery Recyclers* v. *EPA,* 716 F.3d 667, 673 (D.C. Cir. 2013), *NRDC* v. *EPA,* 529 F.3d 1077(D.C. Cir. 2008).

Contrary to the commenter's assertions, we did estimate costs in order to provide the resulting impacts of the proposed flare requirements, and we are not revising these costs as a result of this comment. The largest impact on annual costs is associated with supplemental natural gas to meet the NHVcz limit, which the commenter estimated is approximately 18 times higher than our estimate ($66.8 million from the commenter versus $3.7 million for the EPA). We find the commenter's cost estimate unreasonable, and that commenters notably did not account for adjusting other flare parameters instead of using such a large amount of natural gas. We are also unable to re-create and establish how the estimated costs were developed by commenters due to a lack of information pertaining to baseline flare flows, waste gas compositions, current supplemental natural gas flows and steam flows. The commenter also stated that we did not include costs for flow monitors and controls, but these were specific items we included at proposal (see Table 3 in the memorandum, *Control Option Impacts for Flares Located in the Ethylene Production Source Category*), and the EPA's cost estimate for these items is higher than the commenter's cost estimate.

Comment: We received comments in support of and against the proposed work practice requirements for visible emissions and flare tip velocity. A commenter contended that the inherent nature of the ethylene production process (*i.e.,* ethylene production requires a significant amount of compression and refrigeration) necessitates the proposed flare work practice requirements to an even greater extent than the refinery sector. According to the commenter, in an upset situation such as a power outage or equipment malfunction, the compression and refrigeration systems can be lost resulting in a rapidly expanding volume of gas that must be removed from the process equipment to prevent potential damage and minimize safety risks.

Several commenters objected to the EPA's proposed emergency flaring provisions for smoking flares. Some commenters stated that the proposed number of visible emissions exceedance events allowed is not supported by data the EPA received in response to the CAA section 114 ICR. A commenter said that the information the EPA used indicates that there were zero velocity exceedances during any smoking; however, 40 CFR 63.670(o) implies that the flare must be operating above its smokeless capacity in order to smoke. The commenter said that unless the EPA has data indicating that these flares were exceeding their smokeless capacity (*i.e.,* there was a tip velocity exceedance) at the time of the smoking event, the database that the EPA used does not support its claims on the frequency of these events at the best performing flares and the proposed deviation definitions at 40 CFR 63.670(o)(7)(ii) and (iv) are arbitrary and capricious. Similarly, a commenter noted that the EPA ''assumed . . . that the best performers would have no more than one [visible emissions] event every 7 years'' based on industry survey data provided by the American Chemistry Council (ACC), which the commenter noted fails to provide date ranges for the data presented, or to identify the location of the facilities. The commenter also noted that the survey identifies zero exceedances of the flare tip velocity from any facility, and the average presented by industry is provided without any context. The commenter warned that without access to more detailed underlying data it is impossible to determine if the ACC data includes smoking events that occurred at flares when the flow rate to the flare was also below the smokeless capacity of the flare. The commenter urged that smoking events that occur when the smokeless capacity of a flare is not exceeded should not be included in determining the average frequency of hydraulic load smoking events at flares.

A commenter also stated that the information the ACC provided to the EPA showing visible emissions events and velocity exceedances (see Appendix B of Docket ID Item No. EPA–HQ–OAR–2017–0357–0017) identifies two flares as material handling flares and one flare as a process wastewater flare while all other flares are not characterized in any way. The commenter said that the inconsistent characterization of the flares raises questions about the nature of the flares used to support the EPA's claims on the frequency of these events at the best performing flares.

In addition, the commenter reiterated that the proposed revisions for releases from smoking flares do not satisfy CAA section 112(d)(2) or (3). The commenter said the EPA did not provide rationale, and did not meet, the statutory test for smoking flares. The commenter also said the EPA did not provide a reasonable analysis or determination showing that allowing one to two uncontrolled such events every 3 calendar years (plus *force majeure* event releases) reflects the average of the best performers' reductions and is the ''maximum achievable degree of emission reduction.'' The commenter urged that what is ''achievable for the average'' is not the statutory test. The commenter expressed the view that it is unclear how a smoking flare could ever meet CAA sections 112(d)(2) and (3).

The commenter recommended the EPA consider the data it collected on flares to determine the amount of HAP emitted. The commenter stated that the EPA has not explained why its own data on emission exceedances from equipment connected to flares would not allow it to set limits on smoking flares, and that the EPA has not and could not show, based on the record that the complete exemption for one to two smoking flare incidents at each flare, every 3 years, in any way satisfies CAA section 112(d)(3). The commenter stated that the EPA's failure to review actual data is especially egregious given the fact that the Texas Commission on Environmental Quality (TCEQ), the BAAQMD, and the SCAQMD have extensive data on the frequency that operators report smoking emissions from flares,[9] and given that the

[9] The commenter provided the following reference: This data is available on TCEQ Emission Event Reporting website (*http://*

Continued

smokeless capacity of the flare is an easily ascertainable characteristic. The commenter argued that using this data, the EPA could have potentially determined a MACT floor that complies with the requirements of the CAA.

The commenter also warned that the EPA does not meet the BTF requirements in CAA section 112(d)(2). The commenter stressed that the EPA has not demonstrated that allowing multiple smoking flare exemptions from the standards is the ''maximum achievable degree of emission reduction'' from those flares. The commenter argued that, at the very least, the EPA must set standards on the duration and amount of gas that is routed to a flare during a malfunction event that causes the flare to operate above its smokeless capacity, in addition to the cap on the number of exemptions included in the proposed rule. The commenter stated that the HAP emission limits for flares during malfunctions cannot be less stringent than the emission limits that apply during normal operations.

The commenter stated that, based on data from TCEQ, smoking flare events can last several minutes or multiple days, and the EPA's proposed regulations do not make clear whether this should be considered a single event or multiple smoking events. The commenter additionally noted that the EPA's proposed regulation does not make clear whether visible smoke emissions that are caused by multiple root causes occurring at the same time should count as one visible emission event or two.

Response: First, as explained at proposal flares are used as APCDs to control HAP emissions in both the Petroleum Refinery and Ethylene Production source categories. It is therefore not a specific emission source within the EMACT standards and, thus, we did not seek to establish a MACT floor for flares at the time that we promulgated the EMACT standards in the GMACT NESHAP. Rather, we identified flares as an acceptable means for meeting otherwise applicable requirements and we established flare operational standards that we believed would achieve a 98-percent destruction efficiency on a continual basis. As previously explained, recognizing that flares were not achieving the 98-percent reduction efficiency in practice at all times, we proposed additional requirements in the October 9, 2019, proposed rule (84 FR 54294) to ensure that flares operate as intended at the time we promulgated the EMACT standards. This is entirely consistent with agency practice of fixing underlying defects in existing MACT standards under CAA sections 112(d)(2) and (3), provisions that directly govern the initial promulgation of MACT standards. (See, National Emission Standards for Hazardous Air Pollutants from Petroleum Refineries, October 28, 2009, 74 FR 55670; and National Emission Standards for Hazardous Air Pollutants: Group I Polymers and Resins; Marine Tank Vessel Loading Operations; Pharmaceuticals Production; and the Printing and Publishing Industry, April 21, 2011, 76 FR 22566)).

Regarding the operational standards for flares operating above the smokeless capacity, we note that these flare emissions are due to a sudden increase in waste gas entering the flare, typically resulting from a malfunction or an emergency shutdown at one or more pieces of equipment that vents emissions to the flare. The EPA disagrees with commenter's suggestion that standards are warranted for the duration and amount of gas discharged to a flare during malfunction events, which are infrequent, unpredictable and not under the control of an operator. Flares are associated with a wide variety of process equipment and the emissions routed to a flare during a malfunction can vary widely based on the cause of the malfunction and the type of associated equipment. Thus, it is not feasible to establish a one-size-fits-all standard on the amount of gas allowed to be routed to flares during a malfunction. Moreover, we note that routing emissions to the flare will result in less pollution than the alternative, which would be to emit directly to the atmosphere. We note that we do not set similar limits for thermal oxidizers, baghouses, or other control devices that we desire to remain operational during malfunction events to limit pollutant emissions to the extent practicable. However, we did propose work practice standards that we believed would be effective in reducing the size and duration of flaring events that exceed the smokeless capacity of the flare to improve overall flare performance. On that premise, we acknowledge that the data we received from ACC's survey identifies zero exceedances of the flare tip velocity during a smoking event; and we agree with the commenter that our proposed determination of the frequency of these events at the best performing sources is not supported. Therefore, in response to comments on our proposal, we are not finalizing the proposed work practice standard for when the flare vent gas flow rate exceeds the smokeless capacity of the flare and the tip velocity exceeds the maximum flare tip velocity operating limit. Instead, we are finalizing provisions that require compliance with the maximum flare tip velocity operating limit at all times, regardless of whether you are operating above the smokeless capacity of the flare.

In order to ensure 98-percent destruction of HAP discharged to the flare (as contemplated at the time the EMACT standards were promulgated) during both normal operating conditions when the flare is used solely as a control device and malfunction releases where the flare acts both as a safety device and a control device, we are finalizing, as proposed, the work practice standard for when the flare vent gas flow rate exceeds the smokeless capacity of the flare and visible emissions are present from the flare for more than 5 minutes during any 2 consecutive hours during the release event. As described in more detail in our technical memorandum, *Control Option Impacts for Flares Located in the Ethylene Production Source Category,* located at Docket ID Item No. EPA–HQ–OAR–2017–0357–0017, the best performing flare in the Ethylene Production source category for which we have information on visible emissions has a visible emissions event once every 7 years. Even if the best-performing flare ''typically'' only has one event every 7 years, the fact that visible emissions events are random by nature (unpredictable, not under the direct control of the owner or operator) makes it difficult to use a short term time span to evaluate a backstop to ensure an effective work practice standard. Thus, when one considers a longer term time span of 20 years, our analysis shows that three events in 3 years would appear to be ''achievable'' for the average of the best performing flares. We disagree with commenters that we should allow more or fewer visible emissions events above the smokeless capacity of a flare. We also disagree with commenters that the regulatory text we are cross-referencing at 40 CFR 63.670(o) is unclear about what constitutes an event or how to handle multiple root causes, especially since there is generally only a singular root cause at the heart of a visible emissions event.

With respect to the comment about conducting a BTF analysis under CAA section 112(d)(2), we note the work practice combustion efficiency standards (specifically limits on the net heating value in combustion zone)

www.tceq.texas.gov/field/eventreporting) and is also available in Excel format from the state agency.

apply at all times, including during periods of emergency flaring. Because flares are not an affected emissions source, but rather an APCD, no BTF analysis is needed. While requiring the use of systems such as back-up power or adding additional flares for additional flare capacity might alleviate additional visible emission events, we note that facilities would have to invest significant capital to build a back-up cogeneration power plant or add additional flare capacity for flares to operate on standby to handle very infrequent events we are limiting in this final rule. Combined with the costs, significant additional emissions would also be generated from a cogeneration power plant or from a flare operating in standby to handle infrequent smoking events and this would lead to a net environmental disbenefit and is contradictory to the commenter's own concerns about limiting emissions from flares since owners or operators of ethylene production facilities would have to construct more of them.

Comment: A commenter noted that CAA section 112(h) allows the EPA to set a ''work practice standard'' in lieu of a numerical emission standard only if it is ''not feasible to prescribe or enforce an emission standard.'' Further, the commenter noted, even when the EPA sets a work practice standard, such a standard must still be consistent with CAA sections 112(d)(2) and (3). The commenter rejected the EPA's rationale for the CAA section 112(h) determination in the proposal that ''application of a measurement methodology for PRDs that vent to atmosphere is not practicable due to technological and economic limitations.'' The commenter stated that the EPA's statement is false, and that the EPA's proposed reporting and recordkeeping requirements would mandate facilities ''calculate the quantity of organic HAP released during each pressure release event.'' According to the commenter, a 2007 SCAQMD report found that ''new (wireless) technology allows for continuous monitoring of PRDs without significant capital expense and makes it easy for operators to identify valve leaks . . . VOCs that are emitted from PRDs may be accurately identified, estimated, remedied, and reported immediately.'' [10] The commenter stated this monitoring technology is already in use at refineries in the United States,[11] and noted that SCAQMD required refineries to install wireless monitoring on 20 percent of the PRDs at their facilities since 2003 and on all PRDs since 2009.[12] The commenter noted that the EPA also relied on TCEQ data from seven ethylene production facilities that reported the quantity of HAP emissions released during specific PRD release events. For these reasons, the commenter argued that it is possible to measure PRD emissions, and they actually have been measured. The commenter stated that the EPA has not shown and cannot show why, in view of existing data on the amount, duration, and types of PRD releases, it cannot set a limit on these releases. The commenter further asserted that PRD releases may be captured and controlled; therefore, the EPA cannot use a work practice standard under CAA sections 112(h)(1) and (2)(A) to justify failing to set an appropriate numerical emission standard for them.

A commenter further objected to the proposed work practice standards because, they asserted, the EPA proposed the standards in part on the basis that the cost of measuring emissions is too high. The commenter stated that the EPA must set a MACT floor without consideration of cost, and that the cost is reasonable if 12 percent of existing sources met the limitation. The commenter argued that although the EPA stated that it would be economically prohibitive to construct an appropriate conveyance and install and operate continuous monitoring systems for each individual PRD that vents to atmosphere, the EPA fails to provide the estimated cost for construction and installation of such monitoring systems. The commenter argued that any such calculation would need to consider the impact of the EPA and state imposed flaring reduction programs, and the social and economic cost of the excess emissions from PRD emissions, including costs associated with the disruption in communities that are subject to ''shelter in place'' programs because of episodic releases from facilities.

Response: We disagree with the commenter's assessment and maintain the rationale provided in the proposal preamble (84 FR 54302, October 9, 2019), where we specifically discussed the issue related to constructing a conveyance and quantitatively measuring PRD releases and concluded that these measures were not practicable and that a work practice standard was appropriate. Owners or operators can estimate the quantity of HAP emissions released during a PRD release event based on vessel operating conditions (temperature and pressure) and vessel contents when a release occurs, but these estimates do not constitute a measurement of emissions or emission rate within the meaning of CAA section 112(h). The monitoring technology suggested by the commenter is adequate for identifying PRD releases and is one of the acceptable methods that facility owners or operators may use to comply with the continuous monitoring requirement. However, we disagree that it is adequate for accurately measuring emissions for purposes of determining compliance with a numeric emission standard. The technology cited by the commenter is a wireless monitor that provides an indication that a PRD release has occurred, but it does not provide information on either release quantity or composition. PRD release events are characterized by short, high pressure, non-steady state conditions that make such releases difficult to quantitatively measure. As such, we maintain our position that the application of a work practice standard is appropriate for PRDs.

Comment: We received comments in support of and against the proposed work practice standards for PRDs. Specific comments against the proposal related to whether they apply at all times.

A commenter stated that even assuming *arguendo* that the EPA could set a work practice standard for PRDs and that it otherwise had satisfied CAA sections 112(h) and (d), its action is unlawful because there would be no restriction that applies continuously as

[12] The commenter provided the following reference: SCAQMD, Staff Report at ES–2, 2–3 to 2–5, Docket ID Item No. EPA–HQ–OAR–2010–0869–0024.

the CAA directs.[13] The commenters stated that the proposed rule would permit an uncontrolled amount of HAP to be released by a PRD repeatedly, when it is opened at the facility's sole discretion. A commenter stated this means that once or twice every 3 years and whenever there is a *force majeure* event, any amount of HAP that may come from these devices could be released, and would not be a violation, no matter the original source of emissions.

A commenter argued that the fact that the EPA required three non-defined steps (including monitoring mechanisms, such as flow indicators, routine inspection and maintenance, and operator training) to be taken to try to prevent such releases does not mean that there is a continuous CAA section 112-compliant emission standard that applies. The commenter stated that none of these steps would restrict pollution released during PRD openings, would make the PRD malfunction exemptions lawful, or would turn them into a standard instead of an exemption. The commenter noted that although there are some potential controls listed as work practice requirements that a facility may choose to implement (*e.g.,* ''deluge systems'' and ''staged relief systems where the initial PRD discharges to a control system''), the proposed rule does not require any facility to either install them or any other controls or limits on PRDs. The commenter stated this should be required pursuant to the MACT floor, as the best performing PRDs are controlled, and the best performing process units are not equipped with any PRDs that are capable of venting emissions directly to the atmosphere.

The commenter stated that because analyses, reports, and potential corrective action steps would be required after such releases occur, that does not mean that the EPA has implemented a continuous emission standard. The commenter also stated that uncontrolled releases are not considered a violation, and there is no civil penalty for the HAP emitted during the allowable PRD releases. Under the proposed rule, the commenter argued, no matter how many corrective actions a facility may take afterward, the release would still be an authorized release, allowing an unlimited amount of toxic air pollution to be emitted into the air from facility equipment albeit through a PRD. The commenter said that post-hoc measures may help discover why a release happened, and might even help to prevent release, but these measures are not considered controls or limits on the pollution that was released. The commenter stated that the EPA additionally failed to propose any regulatory requirement to end PRD releases as soon as it is discovered.

Another commenter agreed that the EPA has the authority and obligation to adopt work practice standards under the *Sierra Club* SSM decision. The commenter reiterated the *Sierra Club* decision and said the EPA must ensure that some ''emission standard'' applies at all times—except that the standard that applies during normal operation need not be the same standard for SSM periods. The commenter said the requirement for ''continuous'' standards means only that a facility may not install control equipment and then turn it off when atmospheric conditions are good; and it does not mean that work practice standards must physically restrict emissions from all equipment at all times. The commenter said that the EPA has consistently imposed as ''MACT'' standards a variety of work practice obligations that do not prohibit or limit emissions to a specified level at all times, but rather are designed to limit overall emissions from various processes over the course of a year. The commenter said the EPA's own LDAR programs illustrate this distinction. The commenter contended that no court has suggested that periods of ''unlimited emissions'' [*e.g.,* 40 CFR 63.119(b)(1) (internal floating roof allowed not to contact with stored material during filling/emptying); 40 CFR 63.119(b)(6) (covers on tank openings may be opened when needed for access to contents); 40 CFR 63.135(c)(2) (allowing openings on containers as necessary to prevent physical damage)] render these requirements insufficient under CAA section 112. Rather, the work practice standards associated with these requirements—*e.g.,* maintaining openings in a closed position except as necessary for access; conducting filling/emptying as rapidly as possible—are considered to be acceptable mechanisms to minimize overall emissions from these types of equipment, even when they do not limit emissions at all during a few brief periods that are necessary for operational or safety reasons.

Response: We disagree with the underlying premise of the first commenter that any PRD release should be deemed a violation of section 112 and must be directly enforceable. As we have explained, we believe that a work practice standard, rather than a numerical limit applicable to each PRD release is appropriate. To the extent the commenter is claiming that a standard does not apply at all times, we also disagree. Although there is not a numerical limit that each PRD must meet at all times, we have established a work practice standard that does apply at all times. The work practice standard for PRDs requires operators to adopt prevention measures to minimize the likelihood of PRD release events, and the installation and operation of continuous monitoring device(s) to identify when a PRD release has occurred. These measures must be complied with at all times, and thus the work practice standard does apply at all times. (See for example, *Mexichem Specialty Resins, Inc.* v. *EPA,* 787 F.3d 544, 560 (D.C. Cir. 2015) (''The regulations anticipate that regulated entities will be allowed to open bypasses during maintenance as long as they comply with the opening provisions set forth therein.''). Additionally, having a backstop on the number of PRD releases allowed and requiring root cause analysis and corrective action analysis will ensure PRD releases are further minimized. We also note that we have always (since the rule was initially promulgated) had requirements in our equipment leaks regulations at 40 CFR 63.1030(c) for the Ethylene Source category that ensure a PRD has properly reseated after a release. We agree with the second commenter that there are a variety of work practice standards the EPA has adopted in its section 112 regulations that operate similar to the PRD requirements in that they do not prohibit emissions from equipment at all times or otherwise establish numeric limits for emissions from those pieces of equipment.

Comment: Commenters stated that the EPA cannot use CAA section 112(h) to allow unlimited HAP releases from PRDs because the authorizations for uncontrolled PRD releases are back-door exemptions from the other underlying standards regulating ethylene production facilities. For uncontrolled PRD releases, the commenter asserted that the EPA did not and could not reasonably explain how it is lawful to authorize completely uncontrolled emissions under CAA section 112(h). The commenter noted that the Court previously upheld a decision not to create a malfunction or ''excursion'' provision.[14]

The commenter argued that historically there has been no limit on

[13] The commenter provided the following reference: *Sierra Club,* 551 F.3d at 1028; CAA section 304(k).

[14] The commenter provided the following reference: *Weyerhaeuser Co.* v. *Costle,* 590 F.2d 1011, 1057 (D.C. Cir. 1978) (citing *Am. Petrol. Inst.* v. *EPA,* 540 F.2d 1023, 1036 (10th Cir. 1976) (denying excursions)).

emissions when a PRD acts like a process vent, and that the EPA's purpose in conducting this rulemaking was, in part, to remove these unlawful exemptions as compelled by law. The commenter warns that the EPA's proposed rule reinstates new versions of precisely the same sort of exemptions, by allowing at least one, and in some instances two ''free passes'' to emit uncontrolled pollution every 3-year period for each PRD. The commenter further remarked that exempting such emissions from the definition of violation negates the meaning of ''emission standard,'' and shows that no standard applies to these releases.

The commenter stated that the EPA cannot create any exemption from or weakening of EMACT equipment standards simply because excess emissions from equipment are routed through a PRD. The commenter argued that doing so unlawfully weakens the original CAA section 112(d) standards for the linked equipment, without any reasoned explanation or support for doing so. Further, the commenter stated that because the EPA proposes that no emission standard applies during the uncontrolled releases, the exemptions violate CAA sections 112(d) and 302(k) and flout the Court's decisions in these cases, and also conflict with the EPA's decision not to create an unlawful exemption in the Boilers case.[15] The commenter stated that the EPA provided no statutory explanation or interpretation of how its action could comport with CAA sections 112 and 302(k), therefore, if the EPA were to finalize these exemptions, the EPA would open itself up to a violation of the CAA's core rulemaking requirements applicable to CAA sections 112(d) and (f) standards.

The commenter asserted that the proposed rule therefore seeks to establish major exemptions that allow uncontrolled releases due to predictable and often-repeated malfunctions. The commenter noted that the even though the standard explicitly defines a violation as the second or even the third such release from the same PRD during a 3-year period, whether the second uncontrolled release from the same PRD is a violation depends on if the release has the same root cause. The commenter stated that PRDs are not independent emission points, and that PRDs never release pollution into the air or smoke unless there is a malfunction. The commenter also asserted that the EPA's attempt to define a new way in which a facility can claim excess emissions are not a violation echoes the ''affirmative defense'' provision the Court held unlawful in *NRDC,* 749 F.3d 1055, 1064 (D.C. Cir. 2013). The commenter argued that the EPA may not flout statutory constraints Congress enacted in its discretion by trying to remove civil penalty liability for excess emissions that violate the CAA and increase human exposure to toxic air pollution directly, contrary to the CAA. The commenter pointed to the cement kilns case, in which they asserted the EPA tried to claim that the unlawful affirmative defense to civil penalties was ''part of the emission standard,'' noted that the Court rejected these arguments in *NRDC,* 749 F.3d 1055, 1064 (D.C. Cir. 2013), and argued that precedent would apply equally here.[16] The commenter further argued that the proposed rule, by allowing owners or operators to conduct root cause analyses for these events, essentially permits owners or operators—not the courts—to make the determination whether they should be subject to enforcement or penalties for certain PRD releases, which determines whether an event is either actionable (*i.e.,* the result of operator error or poor maintenance, or whether it was the result of the same root cause as a prior event). The commenter further stated that the proposed exemptions contravene the citizen suit and penalty provisions by creating a *de facto* complete defense (not just an affirmative defense) from civil penalties for certain uncontrolled emission releases that would otherwise constitute violations. The commenter pointed to a ruling by the Court that explained how creating such a multi-stage complicated assessment to determine if a violation has occurred undermines the purpose of the CAA and the ability to enforce it.[17]

According to the commenter, by granting this exemption, the EPA may incentivize facilities to release large amounts of HAP through PRDs rather than flares to avoid using one of their ''free passes'' for the prohibition on visible smoke emissions from flares. Instead of meeting the CAA section 112 standards that apply to other facility equipment routed to PRDs or flares, the commenter asserted that exemptions authorize a facility to violate those limits and have no liability if the excess emissions are emitted directly into the air. The commenter stated that this even creates a perverse incentive for operators to install redundant PRDs on process equipment. The commenter also stated that, at the very least, the EPA must include regulations prohibiting the installation of new redundant PRDs to circumvent the prohibition on atmospheric releases.

The commenter further stated that emissions from malfunctions at ethylene production facilities that are released through PRDs are a significant source of underestimated HAP emissions. The commenter suggested that the emissions from PRD releases are a substantial problem for the industry as a whole when viewed over time. Further, the commenter argued that there is no upper limit on the amount of pollution an individual PRD event can release to the atmosphere. The commenter asserted that the EPA's proposed exemptions would, therefore, bar enforcement action against the worst events.

A commenter observed that uncontrolled PRD releases are preventable and avoidable, and that they need not occur if a facility avoids over-pressure in the system. The commenter referred to the proposal preamble, noting that such ''pressure build-ups are typically a sign of a malfunction of the underlying equipment,'' and PRDs ''are equipment installed specifically to release during malfunctions.'' Therefore, the commenter argued that the EPA cannot rely on any argument that equipment can fail, and that PRDs are necessary to address over-pressure and avoid a larger safety incident, and that the EPA has not relied on or demonstrated with any evidence that it is a valid concern. The commenter stated that even if it may be considered by the EPA in an administrative enforcement context or by the courts in an enforcement case, the EPA cannot authorize, up front, a whole set of problematic releases.

The commenter stated that the proposed malfunction standards for PRDs also break with prior Agency policy regarding malfunctions and for the use of case-by-case enforcement discretion to address malfunctions. The commenter stated that the Agency has repeatedly explained why case-by-case

[15] The commenter provided the following reference: See *U.S. Sugar Co.,* 830 F.3d at 607–08.

[16] The commenter provided the following reference: EPA, NESHAP, Portland Cement Summary of Public Comments and Responses at 124–25 (December 20, 2012) (''EPA's view is that the affirmative defense is part of the emission standard and defines two categories of violation.'').

[17] The commenter provided the following reference: ''Once excursion provisions are promulgated, an enforcement case no longer turns on the sharply defined issue of whether the plant discharged more pollutant than it was allowed to, but instead depends on murky determinations concerning the sequence of events in the plant, whether those events would have been avoidable if other equipment had been installed, and whether the discharge was within the intent of the excursion provision. Consequently, what Congress planned as a simple proceeding suitable for summary judgments would become a form of inquest into the nature of system malfunction.'' Weyerhaeuser, 590 F.2d at 1058.

evaluation of such issues is the only workable approach, and has repeatedly finalized prohibitions on uncontrolled releases from PRDs that vent directly to the atmosphere, fully aware that allowing such releases without an emission limit is a malfunction exemption prohibited both by the CAA and the Court's decision in *Sierra Club.* The commenter objected to this change and indicated that the EPA has failed to clearly explain this break with prior precedent.[18] The commenter noted that the EPA finalized similar provisions prohibiting PRD releases in MACT standards for Group IV Polymers and Resins, Pesticide Active Ingredient Manufacturing, and Polyether Polyols Production. The commenter further stated that the Court recently upheld this type of prohibition in *Mexichem Specialty Resins, Inc. v EPA,* 787 F.3d 544, 560–61 (DC Cir. 2015) and urged the EPA to finalize the standards for PRD as proposed. The commenter noted that in light of the EPA's prior policy, there can be ''no doubt'' that prohibiting uncontrolled PRD releases is lawful and consistent with the CAA. The commenter stated that the EPA has neither provided a reasoned explanation for the exemptions, nor acknowledged or explained the break in its prior policy against malfunction exemptions.

Response: We disagree that PRDs are simply bypasses for emissions that are subject to emission limits and controls and that they, thus, allow for uncontrolled emissions without violation or penalty. PRDs are generally safety devices that are used to prevent equipment failures that could pose a danger to the facility and facility workers. PRD releases are triggered by equipment or process malfunction. As such, they do not occur frequently or routinely and do not have the same emissions or release characteristics that routine emission sources have, even if the PRD and the vent are on the same equipment. This is because conditions during a PRD release (temperature, pressure, and vessel contents) differ from the conditions that exist during routine emissions from equipment. For example, emissions from ethylene process vents are predictable and must be characterized for emission potential and applicable control requirements prior to operation in the facility's NOCS report. In addition, PRDs must operate in a closed position and must be continuously monitored to identify when releases have occurred.

Under the final rule, if an affected PRD releases to the atmosphere, the owner or operator is required to perform root cause analysis and corrective action analysis as well as implement corrective actions and comply with the specified reporting requirements. The work practice standard also includes criteria for releases from affected PRDs that would result in a violation at 40 CFR 63.1107(h)(3)(v). We also note that a facility cannot simply choose to release pollutants from a PRD; any release that is caused willfully or caused by negligence or operator error is considered a violation.

We also disagree that PRDs are not independent emission points and instead function in venting emissions from other emission points during a malfunction. The commenter incorrectly suggests that the PRD work practice standard replaces the existing emission standards for connected equipment. The amendments to the NESHAP addressing PRDs do not affect requirements in the NESHAP that apply to equipment associated with the PRD. For example, compliance with the PRD provisions are required in addition to requirements for ethylene process vents for the same equipment. We also disagree with the comment that the standards for PRDs also break with prior agency policy regarding malfunctions. As commenters correctly note, the EPA has indeed both set work practice standards for PRDs and prohibited PRD releases in other source categories. As explained at proposal, however, the basis of the work practice standards promulgated for PRD releases in the Petroleum Refinery Sector RTR (80 FR 75178, December 1, 2015) were our underlying basis for the proposed work practice standards for PRD releases for facilities in the Ethylene Production source category (84 FR 54303, October 9, 2019).

The EPA evaluated the best performing facilities in determining the appropriate work practice standard, and as a result considered requirements established in the SCAQMD and BAAQMD rules and the Chemical Accident Prevent Provisions rule (84 FR 54303, October 9, 2019). These rules are the only rules we are aware of that address the infrequent and unpredictable nature of PRD releases. The EPA established a MACT standard based on these rules, and as part of this, we determined that either two or three PRD releases (depending on the root cause) from a single PRD in a 3-year period is a violation of the work practice standard.

Regarding citizen suits, we note that the regulations do not specify that the EPA Administrator would make a binding determination regarding whether a PRD release is in compliance or a violation, and the issue could be argued and resolved by a court in the context of a citizen suit.

Comment: We received comments in support of and against the work practice standards calling for root cause analysis and certain corrective actions. Some commenters supported the EPA's assessment that even at the best performing sources, releases from PRDs are likely to occur and cannot be safely routed to a control device. A commenter said the EPA's conclusion is consistent with company's experiences that pressure release actuation events, while infrequent, will occur even at properly designed and operated sources, including the best performers. Another commenter said that although they agree with the EPA's conclusion that it is not cost effective to control all PRD releases to the atmosphere, they do not agree that a root cause analysis and corrective action is a warranted work practice in every situation where a PRD relieves to the atmosphere and should not be required as part of the work practice standard for every PRD release. The commenter stated that under the Chemical Accident Prevention Program at 40 CFR 68.81(a), an incident investigation with root cause analysis is required only when the release is a catastrophic release or ''could reasonably have resulted in a catastrophic release.'' The commenter said that a ''catastrophic release'' is defined as a ''major uncontrolled emission, fire, or explosion, involving one or more regulated substances that presents imminent and substantial endangerment to public health and the environment.'' The commenter argued that the EPA has not established sufficient evidence in the background documents for this rulemaking to indicate that conducting a root cause analysis routinely for all PRD releases regardless of whether they meet the definition of ''catastrophic release'' is being performed by the best performing sources in the Ethylene Production source category.

Another commenter asserted that the EPA did not set a standard for PRDs that complies with the CAA requirements to assure both the ''average emission limitation achieved'' by the relevant best-performing sources and the

[18] The commenter provided the following references: See, *FCC* v. *Fox,* 556 U.S. 502, 516 (2009) (citing *Motor Vehicle Mfrs. Ass'n* v. *State Farm Mutual Automobile Insurance Co.,* 463 U.S. 29, 42 (1983)) (''the requirement that an agency provide reasoned explanation for its action would ordinarily demand that it display awareness that it is changing position. An agency may not, for example, depart from a prior policy sub silentio or simply disregard rules that are still on the books.''); see also *Encino* v. *Navarro,* 136 S.Ct. 2117, 2125–26 (2016) (reaffirming *FCC* v. *Fox* and noting the need to explain changes in agency policy based on actual facts and circumstances).

''maximum degree of emission reduction'' that is ''achievable'' and, therefore, the EPA's proposed standards for PRDs do not meet the CAA sections 112(d)(2) and (3) test. The commenter states there is no discussion in the proposed rule of these factors for PRD releases, much less an analysis or determination that allowing one—two uncontrolled releases every 3 years (plus *force majeure* event releases) reflects, at minimum, the average of the best performers' reductions, and is the ''maximum achievable degree of emission reduction.''

The commenter stated that the TCEQ data that the EPA relies on clearly demonstrate that at least 23 percent (likely higher) of ethylene production facilities have zero atmospheric releases. The EPA reviewed roughly 30 percent of all operating ethylene production facilities (*i.e.,* seven of 26 ethylene production facilities) in the source category that were chosen at random. The commenter notes that only one of the events was actually an atmospheric PRD release on a properly operating PRD, which means that six facilities, or 23 percent of all operating ethylene production facilities, had no atmospheric releases on a properly operating PRD. The commenter noted that the number of ethylene production facilities with zero atmospheric releases is higher. The commenter also stated that the EPA has not explained why it relied on data from the petroleum refinery sector when data for ethylene production facilities is readily available and relied on elsewhere in the rulemaking. The commenter noted that compliance data for refineries from 2019 under the 2015 Petroleum Refineries NESHAP that is publicly available shows that the average uncontrolled PRD has far fewer releases to the atmosphere than the EPA claims that the best performers do, and that the best-performing uncontrolled PRDs are likely to have no atmospheric releases over a 3-year period. The commenter provided data from 40 CFR part 63, subpart CC compliance reports available on the websites of state environmental agencies in Louisiana, Texas, and Indiana for 10 refineries that collectively represented approximately 1,030 uncontrolled PRDs. The commenter noted that these data suggest that the EPA is proposing a number of releases that is exponentially higher than what has been demonstrated by real-world results from refineries thus far, and that the average uncontrolled PRD from the average refinery has far fewer than the two or three releases to the atmosphere over 5 years that the EPA claims that the best performers do.

A commenter argued that the EPA should set a zero emission limit for all PRDs because the best-performing PRD has no emissions to the atmosphere and the average of the best-performing 12 percent emit nothing to the atmosphere. The commenter stated that since the emission limitation for new sources is to reflect the performance of best performing PRD, new PRDs would presumably be required to capture and return discharges to process units; existing PRDs would have to meet the average of the best performing PRD, which could not be less stringent than the emission rate of the best performing PRD controlled by flares.

A commenter recommended that the EPA require new and modified atmospheric PRDs or existing PRDs on modified process equipment to be routed to the fuel gas system, flare, or other control device that achieves 98-percent destruction efficiency, pursuant to the MACT floor, as the best performing PRDs are controlled and the best performing process units are not equipped with any PRDs that are capable of venting emissions directly to the atmosphere. The commenter requested that the EPA propose that uncontrolled HAP emissions no longer be allowed from a PRD, and any releases from such devices would have to be routed through a control device.

The commenter further stated that the EPA's determination on PRDs was based on review of SCAQMD and BAAQMD adopted programs that attempt to reduce uncontrolled releases from PRDs, with generally more stringent emission limitations and LDAR programs than federal programs. The commenter stated that the EPA should adopt the best features of those programs in strengthening the NESHAP, but that these efforts were not subject to or aiming to satisfy the MACT floor requirements of the CAA, nor are they determinative of the MACT floor for PRDs, which must be based on the level of control ''achieved in practice'' by the relevant best-performing 12 percent of emission sources (for existing sources), or the best single source (for new sources).

According to the commenter the SCAQMD data on PRD releases from refineries shows that five out of eight (more than 50 percent) of regulated facilities reported zero atmospheric PRDs releases between 2010 and 2015 (the total number of refineries in the SCAQMD data do not include those operated by Alon Refining, which were idled in 2012). Thus, the commenter stated that the SCAQMD data demonstrate that the best performing PRDs do not release emissions directly to the atmosphere.

The commenter further stated that the EPA has not actually implemented the requirements of the BAAQMD and SCAQMD programs, and that the BAAQMD and SCAQMD programs are far more protective than the proposed rule. First, the commenter noted the BAAQMD requires that the operator must control (via flare or routing to a process unit) all PRDs that discharge for a second time in a 5-year period, whereas the SCAQMD rules include a similar provision, but offer as an alternative payment of a fee of $350,000 for each PRD that is not controlled. The commenter added that SCAQMD rules also require control of any PRD that has a single large release of greater than 2,000 pounds per day (lbs/day). Second, the commenter noted the BAAQMD and SCAQMD rules require the use of three redundant systems, including worker training, inspection, and maintenance, and two redundant ''hardware'' oriented systems. The third significant difference noted by the commenter is the greater number of releases allowed by the option to parse releases by ''root cause.''

The commenter also stated that the EPA appears to have inappropriately categorized PRDs in its analysis. The commenter noted that the EPA stated it intended to regulate ''atmospheric'' PRD releases, *i.e.,* releases to the atmosphere, including those vented to a control device, however, in the proposed rule, the EPA appears to have effectively ignored the ''best controlled'' PRDs (those routed to processes with no discharge to the environment) and the ''well-controlled'' PRDs (those routed to high quality flares) and determined the MACT floor based on PRDs with some lesser level of regulation. The commenter stressed that the CAA does not allow the EPA to categorize in this manner (see CAA section 112(d)(1) (allowing the EPA only to ''distinguish among classes, types, and sizes of sources'')).

Response: At proposal, the EPA provided extensive discussions on why it was appropriate to establish a work practice standard for PRDs that vent to atmosphere, under CAA section 112(h). 84 FR 54302–304. We explained that no ethylene production facility is subject to numeric emission limits for PRDs that vent to the atmosphere. We posited that the EPA did not believe it was appropriate to subject PRDs that vent to the atmosphere to numeric emission limits due to technological and economical limitations that make it impracticable to measure emissions from such PRDs. We further explained

that CAA section 112(h)(1) allows the EPA to prescribe a work practice standard or other requirement, consistent with the provisions of CAA section 112(d) or (f), in those cases where, in the judgment of the Administrator, it is not feasible to enforce an emission standard. Additionally, we explained that CAA section 112(h)(2)(B) defines the term ''not feasible'' in this context as meaning that ''the application of measurement technology to a particular class of sources is not practicable due to technological and economic limitations.'' We also noted that the basis of the work practice standards promulgated for PRD releases in the Petroleum Refinery Sector RTR (80 FR 75178, December 1, 2015) were our underlying basis for the proposed work practice standards at ethylene production facilities. 84 FR 54303.

As a general matter, CAA section 112 requires MACT for existing sources to be no less stringent than ''the average emission limitation achieved by the best performing 12 percent of the existing sources (for which the Administrator has emissions information). . .'' [(CAA section 112(d)(3)(A)]. ''Emission limitation'' is defined in the CAA as ''. . .a requirement established by the State or Administrator which limits the quantity, rate, or concentration of emissions of air pollutants on a continuous basis, including any requirement relating to operation or maintenance of a source to assure continuous emission reduction, and any design, equipment, work practice, or operational standard promulgated under this chapter'' [CAA section 302(k)]. The EPA specifically considers existing rules from state and local authorities in identifying the ''emission limitations'' for a given source. We then identify the best performers to identify the MACT floor (the no less stringent than level) for that source. The EPA identified the requirements established in the SCAQMD and BAAQMD rules, and the Chemical Accident Prevent Provisions rule (40 CFR part 68) as the basis of the MACT floor because they represented the requirements applicable to the best performing sources. 84 FR 54303. Work practice standards are established in place of a numeric limit where it is not feasible to establish such limits. Thus, in a case such as this, where the EPA has determined that it is appropriate to establish work practice standards, it was reasonable for the EPA to identify the rules that impose the most stringent requirements and, thus, represent what applies to the best performers, and then to apply the requirements from those rules as MACT.

We recognize that the proposed standard for PRDs did not exactly mirror the SCAQMD, BAAQMD, or Chemical Accident Prevent Provisions rules exactly, but consider the requirements to be comparable. For example, we did not include a provision similar to that in the SCAQMD rule that excludes releases less than 500 lbs/day from the requirement to perform a root cause analysis; that provision in the SCAQMD rule does not include any other obligation to reduce the number of these events. Similarly, we did not include a provision that only catastrophic PRD releases must be investigated, as the commenter noted. Rather than allowing unlimited releases less than 500 lbs/day or that are not considered catastrophic, we require a root cause analysis for releases of any size. Because we count small releases that the SCAQMD rule does not regulate at all, we considered it reasonable to provide a higher number of releases prior to considering the owner or operator to be in violation of the work practice standard. We also adopted the three prevention measures requirements in the BAAQMD rule with limited modifications. After considering the PRD release event limits in both the SCAQMD and BAAQMD rules, we determined it was reasonable and appropriate to establish PRD requirements consistent with the flare work practice standard provisions in the SCAQMD and BAAQMD rules. Therefore, the final requirements provide that two or three events (depending on the root cause) from the same PRD in a 3-calendar-year period is a violation of the work practice standard. We also note that a facility cannot simply choose to release pollutants from a PRD; any release that is caused willfully or caused by negligence or operator error is considered a violation.

With respect to subcategorizing PRDs into those that vent to the atmosphere versus those that vent to a control system, we note that the only information we have available about when PRD releases occur at ethylene production facilities are from those PRDs that release directly to atmosphere. Regardless of whether we subcategorize or not, the best performing PRD for which we have information had one release over a 7-year period, and the backstop for how many releases are allowed to occur is based on this information over a long-term period of time given the random nature of when a PRD release might occur.

In summary, the work practice standard we are finalizing provides a comprehensive program to manage entire populations of PRDs and includes prevention measures, continuous monitoring, root cause analysis, and corrective actions, and addresses the potential for violations for multiple releases over a 3-year period. We followed the requirements of section 112 of the CAA, including CAA section 112(h), in establishing what work practice constituted the MACT floor.

Comment: Commenters requested that the EPA add a standard for minimizing emissions arising from degassing storage vessels that are complying with the control requirements in Table 7 to 40 CFR 63.1103(e). A commenter explained this request is due to their current interpretation of the proposed rule, wherein 40 CFR 63.1108(a)(5) no longer applies, and, thus, facilities may be required to vent to control devices at all times, even during degassing events. A commenter stated that the current rule requires facilities to address minimization of emissions from shutdown, which includes degassing, in the SSM plan required by 40 CFR 63.1111; and facilities have historically considered degassing emissions from shutdown of storage vessels to be covered by their SSM plans per 40 CFR 63.1108(a)(5) and relied on the language in 40 CFR 63.1108(a)(5) that back-up control devices are not required. The commenter requested the EPA subcategorize storage vessel degassing emissions as maintenance vents based on class, just as the EPA proposed for process vents. The commenter remarked that the Texas permit conditions presented in the memorandum, *Review of Regulatory Alternatives for Certain Vent Streams in the Ethylene Production Source Category,* apply equally to both maintenance vents and degassing of storage vessels and stated these permit conditions reflect what the best performers have implemented for storage vessel degassing (for both fixed and floating roofs) for both new and existing sources. According to the commenter, it is not feasible to control all the emissions from the entire storage vessel emptying and degassing event and at some point, the storage vessel must be opened and any remaining vapors vented to the atmosphere. The commenter further stated that this venting of vapors to the atmosphere is similar to the EPA description for maintenance vents in the preamble to the proposed rule.

The commenter stated that the EPA referenced the memorandum, *Impacts for Control Options for Storage Vessels at Petroleum Refineries* (Docket Item ID

No. EPA–HQ–OAR–2010–0682–0199), as part of the EMACT storage vessel technology review, in which the EPA concluded that degassing controls for storage vessels were not cost effective. Additionally, the commenter said that in the EPA's summary of public comments and responses to the 2014 proposal for the Petroleum Refinery NESHAP RTR, the EPA stated: ''. . . if a control device is used to comply with this final rule during normal operations, then such a control device must be used at all times, including during degassing of the storage vessel. Any bypassing of emissions from being routed to a control device to being routed to the atmosphere would be considered a violation of the standard.''

Response: We agree with the commenters that complying with the storage vessel requirements in Table 7 at 40 CFR 63.1103(e)(3)(b) and (c) is not appropriate during storage vessel degassing events and a separate standard for storage vessel degassing is necessary, due to the nature of the activity. With the removal of SSM requirements, as proposed, a standard specific to storage vessel degassing does not exist when storage vessels are using control devices to comply with the requirements in Table 7 to 40 CFR 63.1103(e). We also agree with the commenters that storage vessel degassing is similar to maintenance vents (*e.g.,* equipment openings) and that there must be a point in time when the storage vessel can be opened and any emissions vented to the atmosphere. In response to this comment, therefore, we reviewed available data to determine how the best performers are controlling storage vessel degassing emissions.

We are aware of the following three regulations that address storage vessel degassing, two in the state of Texas and the third for the SCAQMD in California. Texas has degassing provisions in the Texas Administrative Code (TAC) (30 TAC Chapter 115, Subchapter F, Division 3. See *https://texreg.sos.state.tx.us/public/readtac%24ext.ViewTAC?tac_view=5&ti=30&pt=1&ch=115&sch=F&div=3&rl=Y*) and through permit conditions (as noted by the commenter, see *https://www.tceq.texas.gov/assets/public/permitting/air/Guidance/NewSourceReview/mss/chem-mssdraftconditions.pdf*) while Rule 1149 contains the SCAMD degassing provisions (see *http://www.aqmd.gov/docs/default-source/rule-book/reg-xi/rule-1149.pdf*). The TAC requirements are the least stringent and require control of degassing emissions until the vapor space concentration is less than 35,000 ppmv as methane or 50 percent of the LEL. The Texas permit conditions require control of degassing emissions until the vapor space concentration is less than 10 percent of the LEL or until the VOC concentration is less than 10,000 ppmv and SCAQMD Rule 1149 requires control of degassing emissions until the vapor space concentration is less than 5,000 ppmv as methane. The Texas permit conditions requiring compliance with 10 percent of the LEL and SCAQMD Rule 1149 control requirements are considered equivalent because 5,000 ppmv as methane equals 10 percent of the LEL for methane.

Ethylene production facilities located in Texas are subject to maintenance, startup, and shutdown (MSS) special permit conditions, but no ethylene production facilities are subject to the SCAQMD rule. Of the 26 currently operating ethylene production facilities, 17 are in Texas. Therefore, the Texas permit conditions relying on storage vessel degassing until 10 percent of LEL is achieved reflect what the best performers have implemented for storage vessel degassing and we considered this information as the MACT floor for both new and existing sources. Notably, this also aligns with the commenter's assessment.

We reviewed permit condition 6 (applicable to floating roof storage vessels) and permit condition 7 (applicable to fixed roof storage vessels) for key information that could be implemented to form the basis of a standard for storage vessel degassing that are required for facilities in Texas. The permit conditions require control of degassing emissions for floating roof and fixed roof storage vessels until the vapor space concentration is less than 10 percent of the LEL. The permit conditions also specify that facilities can also degas a storage vessel until they meet a VOC concentration of 10,000 ppmv, but we do not consider 10,000 ppmv to be equivalent to or as stringent as the compliance option to meet 10 percent of the LEL and are not including this as a compliance option. We also do not expect the best performers would be using this concentration for compliance, which is supported by the commenters recommending the requirements mimic the maintenance vent requirements and because the Texas permit conditions allow facilities to calibrate their LEL monitor using methane. Storage vessels may be vented to the atmosphere once the storage vessel degassing concentration threshold is met (*i.e.,* less than 10 percent of the LEL) and all standing liquid has been removed from the vessel to the extent practicable. These requirements are considered MACT for both new and existing sources and we are finalizing these requirements at 40 CFR 63.1103(e)(10).

We calculated the impacts due to controlling storage vessel degassing emissions by evaluating the population of storage vessels that are subject to control under Table 7 at 40 CFR 63.1103(e)(3)(b) and (c) and not located in Texas. Storage vessels in the Ethylene Production source category in Texas would already be subject to the degassing requirements, and there would not be additional costs or emissions reductions for these facilities. Our review of the CAA section 114 ICR survey responses, showed that most storage vessels are seldom degassed, with an average of 14 years between degassing events. Based on this average and the population of storage vessels that are not in Texas, we estimated two storage vessel degassing events would be newly subject to control each year. Controlling storage vessel degassing would reduce HAP emissions by 1.7 tpy, with a total annual cost of $9,400. See the technical memoranda, *Storage Vessel Degassing Model Development and Final Cost* and *Emissions Impacts for Ethylene Production NESHAP RTR,* which are available in Docket ID No. EPA–HQ–OAR–2017–0357 for details on the assumptions and methodologies used in this analysis.

We also considered options BTF, but we did not identify any and are not aware of storage vessel degassing control provisions more stringent than those discussed above and being finalized in this rule, therefore, no BTF option was evaluated.

Comment: We received comments in support of the proposed work practice standards for decoking operations. One commenter agreed with the EPA's conclusion to propose work practices for decoking operations pursuant to CAA section 112(h)(1) due to technological and economic limitations.

However, another commenter stated that the proposed requirements for new and existing decoking operations failed to meet the requirements of CAA sections 112(d)(2) and (3). The commenter stated that the EPA correctly proposes to remove the general SSM exemptions, but instead proposes to regulate HAP emissions from decoking operations through work practice standards rather than emission limits, and includes four alternate actions for decoking of radiant tubes. The commenter asserted that the EPA may not set work practice standards unless it is ''not feasible to prescribe or enforce an emission standard.'' The commenter noted that the EPA provides no explanation or justification for why it chose four alternate practices, rather

than identifying the combination of practices that would eliminate HAP emissions, or reduce them to the furthest extent possible, consistent with CAA sections 112(d)(2) and (3). Additionally, the commenter stated that the EPA admits that the test data it collected from industry is unreliable, and inappropriately relies on this claim to posit that the Agency is entitled to promulgate a work practice standard. The commenter argued that the EPA's proposed standard is, therefore, inconsistent with the CAA's MACT requirements.

Response: We agree with the commenters who state that work practice standards are appropriate for decoking operations due to technological and economic limitations. We are adopting these proposed work practice standards into the final rule with only minor changes, which are discussed elsewhere in rulemaking record (see the document, *Summary of Public Comments and Responses for the Risk and Technology Review for Ethylene Production,* which is available in Docket ID No. EPA–HQ–OAR–2017–0357).

We disagree that the work practice standards for decoking operations fail to meet the requirements of CAA sections 112(d)(2) and (3) and are inconsistent with the CAA's MACT requirements. As explained in the preamble to the proposed rule, we are adopting work practice standards instead of numeric emission limits as it is ''not feasible to prescribe or enforce an emission standard'' for these emissions because ''the application of measurement technology to a particular class of sources is not practicable due to technological and economic limitations'' (see CAA section 112(h)(2)(B)). 84 FR 54307–309. The emissions stream generated from decoking operations (*i.e.,* the combination of coke combustion constituents, air, and steam from the radiant tube(s)) is very dilute with a high moisture content (*e.g.,* generally >95 percent water); and as explained in the preamble to the proposed rule, based on CAA section 114 ICR data, the majority of emissions measurements from the stream are not ''technologically practicable'' within the meaning of CAA section 112(h) because they are below detection limits. We have also previously reasoned that ''application of measurement methodologies'' under CAA section 112(h) must also mean that a measurement has some reasonable relation to what the source is emitting (*i.e.,* that the measurement yields a meaningful value). We have further explained that unreliable measurements raise issues of practicability, feasibility, and enforceability. Additionally, we have posited that the application of measurement methodology would also not be ''practicable due to . . . economic limitation'' within the meaning of CAA section 112(h) because it would result in cost expended to produce analytically suspect measurements. Refer to the Area Source Boiler Rule (75 FR 31906, June 4, 2010) and the NESHAP for the Wool Fiberglass Manufacturing source category (80 FR 45280 and 45312, July 29, 2015).

Moreover, the final rule, at 40 CFR 63.1103(e)(7), requires owners or operators to conduct daily inspections for flame impingement and also implement at least two of four other work practices to minimize coke combustion emissions from the decoking of the radiant tube(s) in each ethylene cracking furnace. Specifically, 40 CFR 63.1103(e)(7)(ii) through (v) requires owners or operators choose to conduct two of the following work practices: Monitor CO_2 concentration, monitor temperature, purge the radiant tube(s), and/or apply material to the interior of the radiant tube(s)). In addition, the final rule, at 40 CFR 63.1103(e)(8), requires owners or operators to conduct ethylene cracking furnace isolation valve inspections. With regard to the comment that the EPA provided no explanation or justification for why we chose the four other work practices, we believe each control measure is feasible and effective in reducing HAP emissions from decoking an ethylene cracking furnace. As explained in the preamble to the proposed rule (84 FR 54278, October 9, 2019), based on discussions with industry, as well as a review of facility-specific SSM plans that were submitted to the EPA in response to the CAA section 114 request, we determined that owners or operators already conduct work practices to minimize emissions due to coke combustion. We determined the measures to be consistent with CAA section 112(d) controls and reflect a level of performance analogous to a MACT floor; and we believe that it is most effective for sources to determine the best practices from the list of options. Regarding the comment as to unreliable data being used to support setting standards, as previously noted, the EPA typically has wide latitude in determining the extent of data-gathering necessary to solve a problem and courts generally defer to the agency's decision to proceed on the basis of imperfect scientific information, rather than to ''invest the resources to conduct the perfect study.'' *Sierra Club* v. *EPA,* 167 F. 3d 658, 662 (D.C. Cir. 1999)(If EPA were required to gather exhaustive data about a problem for which gathering such data is not yet feasible, the agency would be unable to act even if such inaction had potentially significant consequences . . . [A]n agency must make a judgment in the face of a known risk of unknown degree.'' *Mexichem Specialty Resins, Inc.,* 787 F.3d. 561.).

4. What is the rationale for our final approach and final decisions for the revisions pursuant to CAA sections 112(d)(2) and (3)?

We evaluated all of the comments on the EPA's proposed amendments to revisions for flares used as APCDs, clarifications for periods of SSM and bypasses, including PRD releases, bypass lines on closed vent systems, in situ sampling systems, maintenance activities, certain gaseous streams routed to a fuel gas system, and associated decoking operations for ethylene cracking furnaces (*i.e.,* the decoking of ethylene cracking furnace radiant tubes). For the reasons explained in the proposed rule (84 FR 54278, October 9, 2019), we determined that the flare amendments are needed to ensure that flares used as APCD achieve the required level of MACT control and meet 98 percent destruction efficiency at all times as well as to ensure that CAA section 112 standards apply at all times. Similarly, the clarifications for periods of SSM and bypasses, including PRD releases, bypass lines on closed vent systems, in situ sampling systems, maintenance activities, certain gaseous streams routed to a fuel gas system, and work practice standards associated decoking operations for ethylene cracking furnaces are needed to be consistent with *Sierra Club* v. *EPA, 551 F.3d* 1019 (D.C. Cir. 2008) to ensure that CAA section 112 standards apply at all times. More information and rationale concerning all the amendments we are finalizing pursuant to CAA sections 112(d)(2) and (3) is in the preamble to the proposed rule (84 FR 54278, October 9, 2019), section IV.B.3 of this preamble, and in the comments and our specific responses to the comments in the document, *Summary of Public Comments and Responses for the Risk and Technology Reviews for the Ethylene Production Source Category,* which is available in the docket for this action. Therefore, we are finalizing the proposed provisions for flares (except that we are not finalizing the work practice standard for velocity exceedances for flares operating above their smokeless capacity), finalizing the proposed clarifications for periods of

SSM and bypasses, including PRD releases, bypass lines on closed vent systems, in situ sampling systems, maintenance activities, certain gaseous streams routed to a fuel gas system, and finalizing the proposed work practice standards for the decoking of ethylene cracking furnaces with only minor editorial corrections and technical clarifications.

D. Amendments Addressing Emissions During Periods of SSM

1. What amendments did we propose to address emissions during periods of SSM?

We proposed amendments to the EMACT standards to remove and revise provisions related to SSM that are not consistent with the requirement that the standards apply at all times. In a few instances, we are finalizing alternative standards for certain emission points during periods of SSM to ensure a continuous CAA section 112 standard applies ''at all times,'' (see section IV.C); however for the majority of emission points in the Ethylene Production source category, we proposed eliminating the SSM exemptions and to have the MACT standards apply at all times. More information concerning the elimination of SSM provisions is in the preamble to the proposed rule (84 FR 54278, October 9, 2019).

2. How did the SSM provisions change since proposal?

We are finalizing the SSM provisions as proposed (84 FR 54278, October 9, 2019) with only minor changes to 40 CFR 63.1103(e)(9) to sufficiently address the SSM exemption provisions from subparts referenced by the EMACT standards.

3. What key comments did we receive on the SSM revisions and what are our responses?

While we are finalizing some alternative standards in this final rule for certain emission points during periods of SSM to ensure a continuous CAA section 112 standard applies ''at all times,'' (see section IV.C), we also proposed eliminating the SSM exemptions for the majority of emission points in the Ethylene Production source category. We did not receive many substantive comments on the removal of these exemptions; however, the comments and our specific responses to these items can be found in the document, *Summary of Public Comments and Responses for the Risk and Technology Reviews for the Ethylene Production Source Category,* available in the docket for this action.

4. What is the rationale for our final approach and final decisions to address emissions during periods of SSM?

We evaluated all of the comments on the EPA's proposed amendments to the SSM provisions. For the reasons explained in the proposed rule (84 FR 54278, October 9, 2019), we determined that these amendments, which remove and revise provisions related to SSM, are necessary to be consistent with the requirement that the standards apply at all times. More information concerning the amendments we are finalizing for SSM is in the preamble to the proposed rule (84 FR 54278, October 9, 2019) and in the comments and our specific responses to the comments in the document, *Summary of Public Comments and Responses for the Risk and Technology Reviews for the Ethylene Production Source Category,* available in the docket for this action. Therefore, we are finalizing our approach for the SSM provisions as proposed.

E. Technical Amendments to the EMACT Standards

1. What other amendments did we propose for the Ethylene Production source category?

We proposed that owners or operators submit electronic copies of required performance test results and reports and NOCS reports through the EPA's CDX using the CEDRI; and we proposed two broad circumstances in which we may provide extension to these requirements. We proposed at 40 CFR 63.1110(a)(10)(iii) that an extension may be warranted due to outages of the EPA's CDX or CEDRI that precludes an owner or operator from accessing the system and submitting required reports. We also proposed at 40 CFR 63.1110(a)(10)(iv) that an extension may be warranted due to a *force majeure* event, such as an act of nature, act of war or terrorism, or equipment failure or safety hazards beyond the control of the facility.

To correct a disconnect between having a NPDES permit that meets certain allowable discharge limits at the discharge point of a facility *(e.g.,* outfall) and being able to adequately identify a leak, we proposed the removal of the exemption at 40 CFR 63.1084(c) for once-through heat exchange systems to comply with 40 CFR 63.1085 and 40 CFR 63.1086. We also proposed the removal of the exemption at 40 CFR 63.1084(d) because the provision lacks the specificity of where a sample must be taken to adequately find and quantify a leak from a once-through heat exchange system.

Further, to provide flexibility and reduce the burden on ethylene production facilities, we proposed overlap provisions at 40 CFR 63.1100(g) allowing an owner or operator subject to both the equipment leak EMACT standards and 40 CFR part 60, subpart VVa to comply with the EMACT standards only (instead of complying with both standards), provided the owner or operator also complies with the calibration drift assessment provisions at 40 CFR 60.485a(b)(2).

Finally, we proposed revisions for clarifying text or correcting typographical errors, grammatical errors, and cross-reference errors. These editorial corrections and clarifications are summarized in Table 9 of the proposal. See 84 FR 54278, October 9, 2019.

2. How did the other amendments for the Ethylene Production source category change since proposal?

Since proposal, the electronic reporting requirements and the technical and editorial corrections in Table 9 of the proposal (see 84 FR 54278, October 9, 2019) have not changed and we are finalizing all the proposed requirements. Additionally, we are correcting an error in the final rule to clarify that Periodic Reports must also be submitted electronically (*i.e.,* through the EPA's CDX website using the appropriate electronic report template for this subpart) beginning no later than the compliance dates specified in 40 CFR 63.1102(c) or once the report template has been available on the CEDRI website for at least 1 year, whichever date is later. We are also including several additional minor clarifying edits in the final rule based on comments received during the public comment period.

3. What key comments did we receive on the other amendments for the Ethylene Production source category and what are our responses?

We did not receive many substantive comments on the other amendments in the Ethylene Production RTR proposal. These items generally include issues related to electronic reporting, removal of the allowance to use NPDES permits to identify leaks for heat exchange systems, overlap provisions for equipment leaks, and revisions that we proposed for clarifying text or correcting typographical errors, grammatical errors, and cross-reference errors. The comments and our specific responses to these items can be found in the document, *Summary of Public Comments and Responses for the Risk and Technology Reviews for the*

Ethylene Production Source Category, available in the docket for this action.

4. What is the rationale for our final approach and final decisions for the other amendments for the Ethylene Production source category?

Based on the comments received for these other amendments, we are generally finalizing all proposed requirements. In a few instances (*e.g.,* overlap provisions for equipment leaks), we received comments such that minor editorial corrections and technical clarifications are being made, and our rationale for these corrections and technical clarifications can be found in the document, *Summary of Public Comments and Responses for the Risk and Technology Reviews for the Ethylene Production Source Category,* available in the docket for this action.

V. Summary of Cost, Environmental, and Economic Impacts and Additional Analyses Conducted

A. What are the affected facilities?

As of January 1, 2017, there were 26 ethylene production facilities currently operating that are major sources of HAP, and the EPA is aware of five ethylene production facilities under construction. As such, we estimate that 31 ethylene production facilities will be subject to the final amendments within the next 3 years. A complete list of facilities that are currently subject, or will be subject, to the EMACT standards is available in Appendix A of the memorandum, *Review of the RACT/BACT/LAER Clearinghouse Database for the Ethylene Production Source Category,* in Docket ID No. EPA–HQ–OAR–2017–0357.

B. What are the air quality impacts?

V. Summary of Cost, Environmental, and Economic Impacts and Additional Analyses Conducted

A. What are the affected facilities?

As of January 1, 2017, there were 26 ethylene production facilities currently operating that are major sources of HAP, and the EPA is aware of five ethylene production facilities under construction. As such, we estimate that 31 ethylene production facilities will be subject to the final amendments within the next 3 years. A complete list of facilities that are currently subject, or will be subject, to the EMACT standards is available in Appendix A of the memorandum, *Review of the RACT/BACT/LAER Clearinghouse Database for the Ethylene Production Source Category,* in Docket ID No. EPA–HQ–OAR–2017–0357.

B. What are the air quality impacts?

We estimate HAP emissions reductions of 29 tpy and VOC emissions reductions of 232 tpy as a result of the final amendments for storage vessels, heat exchange systems, and decoking operations for ethylene cracking furnaces. These emissions reductions do not consider the potential excess emissions reductions from flares that could result from the final monitoring requirements; we estimate flare excess emissions reductions of 1,430 tpy HAP and 13,020 tpy VOC. When considering the flare excess emissions, the total emissions reductions as a result of the final amendments are estimated at 1,459 tpy HAP and 13,252 tpy VOC. These emissions reductions are documented in the following memoranda, which are available in Docket ID No. EPA–HQ–OAR–2017–0357: *Assessment of Work Practice Standards for Ethylene Cracking Furnace Decoking Operations Located in the Ethylene Production Source Category; Clean Air Act Section 112(d)(6) Technology Review for Heat Exchange Systems in the Ethylene Production Source Category; Control Option Impacts for Flares Located in the Ethylene Production Source Category;* and *Final Cost and Emissions Impacts for Ethylene Production NESHAP RTR.*

C. What are the cost impacts?

We estimate the total capital costs of the final amendments to be $47.2 million and the total annualized costs to be about $10.4 million in 2016 dollars (annualized costs include annual recovery credits of $180,000). The present value in 2020 of the costs is $87.5 million at a discount rate of 3 percent and $74.9 million at 7 percent. Calculated as an equivalent annualized value, which is consistent with the present value of costs, the costs are $9.4 million at a discount rate of 7 percent and $10.9 million at a discount rate of 3 percent. These cost estimates are included in the memorandum, *Economic Impact Analysis for Ethylene Production NESHAP RTR Final,* which is available in the docket for this action. The costs are associated with the final amendments for flares, PRDs, maintenance (equipment openings), storage vessels, heat exchange systems, and decoking operations for ethylene cracking furnaces. Costs for flares include purchasing analyzers, monitors, natural gas and steam, developing a flare management plan, and performing root cause analysis and corrective action (details are available in the memorandum, *Control Option Impacts for Flares Located in the Ethylene Production Source Category,* in Docket ID No. EPA–HQ–OAR–2017–0357). Costs for PRDs were developed based on compliance with the final work practice standard and include implementation of three prevention measures, performing root cause analysis and corrective action, and purchasing PRD monitors (details are available in the memorandum, *Review of Regulatory Alternatives for Certain Vent Streams in the Ethylene Production Source Category,* in Docket ID No. EPA–HQ–OAR–2017–0357). Maintenance costs were estimated to document equipment opening procedures and to document circumstances under which the alternative maintenance vent limit is used (details are available in the memorandum, *Review of Regulatory Alternatives for Certain Vent Streams in the Ethylene Production Source Category,* in Docket ID No. EPA–HQ–OAR–2017–0357). Heat exchange systems costs include the use of the Modified El Paso Method to monitor for leaks (details are available in the memorandum, *Clean Air Act Section 112(d)(6) Technology Review for Heat Exchange Systems in the Ethylene Production Source Category,* in Docket ID No. EPA–HQ–OAR–2017–0357). The costs associated with decoking operations for ethylene cracking furnaces include conducting isolation valve inspections and conducting flame impingement firebox inspections (details are available in the memorandum, *Assessment of Work Practice Standards for Ethylene Cracking Furnace Decoking Operations Located in the Ethylene Production Source Category,* in Docket ID No. EPA–HQ–OAR–2017–0357). Costs for controlling storage vessel degassing emissions are discussed in the memorandum, *Final Cost and Emissions Impacts for Ethylene Production NESHAP RTR,* which is available in the docket for this action.

D. What are the economic impacts?

The EPA conducted economic impact analyses for the amendments to the final rule, as detailed in the memorandum, *Economic Impact Analysis for Ethylene Production NESHAP RTR Final,* which is available in the docket for this action. The economic impacts of the amendments to the final rule are calculated as the percentage of total annualized costs incurred by affected parent owners to their annual revenues. This ratio of total annualized costs to annual revenues provides a measure of the direct economic impact to parent owners of ethylene production facilities while presuming no passthrough of costs to ethylene consumers. We estimate that none of the 16 parent owners affected by the amendments to the final rule will incur total annualized costs of 0.02 percent or greater of their revenues. Of the 16 parent owners, none

of them is a small business according to the Small Business Administration's small business size standard (for NAICS 325110, 1,000 employees or less). Product recovery, which is estimated as an impact of the final amendments, is included in the estimate of total annualized costs that is an input to the economic impact analysis. Thus, these economic impacts are quite low for affected companies and the ethylene production industry, and consumers of ethylene should experience minimal price changes.

E. What analysis of environmental justice did we conduct?

Executive Order 12898 (59 FR 7629, February 16, 1994) establishes federal executive policy on environmental justice. Its main provision directs federal agencies, to the greatest extent practicable and permitted by law, to make environmental justice part of their mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority populations and low-income populations in the United States.

To examine the potential for any environmental justice issues that might be associated with the source category, we performed a demographic analysis, which is an assessment of risks to individual demographic groups of the populations living within 5 kilometers (km) and within 50 km of the facilities. In the analysis, we evaluated the distribution of HAP-related cancer and noncancer risks from the Ethylene Production source category across different demographic groups within the populations living near facilities.

Our analysis of the demographics of the population with estimated risks greater than 1-in-1 million indicates potential disparities in risks between demographic groups, including the African American, Hispanic or Latino, Over 25 Without a High School Diploma, and Below the Poverty Level groups. In addition, the population living within 50 km of the ethylene production facilities has a higher percentage of minority, lower income, and lower education people when compared to the nationwide percentages of those groups. However, acknowledging these potential disparities, the risks for the source category were determined to be acceptable, and emissions reductions from the final amendments will benefit these groups the most.

The methodology and the results of the demographic analysis are presented in a technical report, *Risk and Technology Review—Analysis of Demographic Factors for Populations Living Near Ethylene Production Source Category Operations,* available in the docket for this action.

F. What analysis of children's environmental health did we conduct?

The EPA does not believe the environmental health or safety risks addressed by this action present a disproportionate risk to children. This action's health and risk assessments are summarized in section IV.A of this preamble and are further documented in the risk report, *Residual Risk Assessment for the Ethylene Production Source Category in Support of the 2020 Risk and Technology Review Final Rule,* available in the docket for this action.

VI. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at *https://www.epa.gov/laws-regulations/laws-and-executive-orders.*

A. Executive Orders 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is not a significant regulatory action and was, therefore, not submitted to the Office of Management and Budget (OMB) for review. The EPA prepared an analysis of the potential costs and benefits associated with this action. This analysis, *Economic Impact Analysis for Ethylene Production NESHAP RTR Final,* is available in the docket for this rule.

B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs

This action is not an Executive Order 13771 regulatory action because this action is not significant under Executive Order 12866.

C. Paperwork Reduction Act (PRA)

The information collection activities in this rule have been submitted for approval to OMB under the PRA. The ICR document that the EPA prepared has been assigned EPA ICR number 1983.10. The OMB Control Number is 2060–0489. You can find a copy of the ICR in the docket for this rule, and it is briefly summarized here. The information collection requirements are not enforceable until OMB approves them.

We are finalizing amendments that change the reporting and recordkeeping requirements for several emission sources at ethylene production facilities (*e.g.,* flares, decoking operations for ethylene cracking furnaces, heat exchangers, PRDs, storage vessels). The final amendments also require electronic reporting, remove the malfunction exemption, and impose other revisions that affect reporting and recordkeeping. This information would be collected to assure compliance with 40 CFR part 63, subparts XX and YY.

Respondents/affected entities: Owners or operators of ethylene production facilities.

Respondent's obligation to respond: Mandatory (40 CFR part 63, subparts XX and YY).

Estimated number of respondents: 31 (total).

Frequency of response: Semiannual and annual.

Total estimated burden: 8,500 hours (per year). Burden is defined at 5 CFR 1320.3(b).

Total estimated cost: $4,410,000 (per year), which includes $3,660,000 annualized capital or operation and maintenance costs.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations in 40 CFR are listed in 40 CFR part 9. When OMB approves this ICR, the Agency will announce that approval in the **Federal Register** and publish a technical amendment to 40 CFR part 9 to display the OMB control number for the approved information collection activities in this final rule.

D. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. This action will not impose any requirements on small entities. There are no small entities affected in this regulated industry. See the document, *Economic Impact Analysis for Ethylene Production NESHAP RTR Final,* available in the docket for this action.

E. Unfunded Mandates Reform Act (UMRA)

This action does not contain an unfunded mandate of $100 million or more as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. The action imposes no enforceable duty on any state, local, or tribal governments or the private sector.

F. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the

relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications as specified in Executive Order 13175. None of the ethylene production facilities that have been identified as being affected by this final action are owned or operated by tribal governments or located within tribal lands. Thus, Executive Order 13175 does not apply to this action.

H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

This action is not subject to Executive Order 13045 because it is not economically significant as defined in Executive Order 12866, and because the EPA does not believe the environmental health or safety risks addressed by this action present a disproportionate risk to children. This action's health and risk assessments are contained in sections IV.A of this preamble.

I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This action is not subject to Executive Order 13211 because it is not a significant regulatory action under Executive Order 12866.

J. National Technology Transfer and Advancement Act (NTTAA) and 1 CFR Part 51

This rulemaking involves technical standards. As discussed in the preamble of the proposal, the EPA conducted searches for the EMACT standards through the Enhanced National Standards Systems Network Database managed by the American National Standards Institute (ANSI). We also contacted voluntary consensus standards (VCS) organizations and accessed and searched their databases. We conducted searches for EPA Methods 1, 1A, 2, 2A, 2C, 2D, 2F, 2G, 3B, 4, 5, 18, 21, 22, 25, 25A, 27, and 29 of 40 CFR part 60, appendix A, EPA Methods 301, 316, and 320 of 40 CFR part 63, appendix A, and EPA Methods 602 and 624 of 40 CFR part 136, appendix A. During the EPA's VCS search, if the title or abstract (if provided) of the VCS described technical sampling and analytical procedures that are similar to the EPA's reference method, the EPA reviewed it as a potential equivalent method.

The EPA incorporates by reference VCS ANSI/ASME PTC 19.10–1981 (Part 10), ''Flue and Exhaust Gas Analyses,'' as an acceptable alternative to EPA Methods 3A and 3B for the manual procedures only and not the instrumental procedures. This method is used to quantitatively determine the gaseous constituents of exhausts including oxygen, CO_2, carbon monoxide, nitrogen, sulfur dioxide, sulfur trioxide, nitric oxide, nitrogen dioxide, hydrogen sulfide, and hydrocarbons, and is available at the American National Standards Institute (ANSI), 1899 L Street NW, 11th floor, Washington, DC 20036 and the American Society of Mechanical Engineers (ASME), Three Park Avenue, New York, NY 10016–5990. See *https://wwww.ansi.org* and *https://www.asme.org.*

Also, the EPA incorporates by reference VCS ASTM D6420–18, ''Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry,'' as an acceptable alternative to EPA Method 18 with the following caveats. This ASTM procedure uses a direct interface gas chromatograph/mass spectrometer to identify and quantify VOC and has been approved by the EPA as an alternative to EPA Method 18 only when the target compounds are all known and the target compounds are all listed in ASTM D6420–18 as measurable. ASTM D6420–18 should not be used for methane and ethane because the atomic mass is less than 35; and ASTM D6420–18 should never be specified as a total VOC method.

In addition, the EPA incorporates by reference VCS ASTM D6348–12e1, ''Determination of Gaseous Compounds by Extractive Direct Interface Fourier Transform (FTIR) Spectroscopy,'' as an acceptable alternative to EPA Method 320 with caveats requiring inclusion of selected annexes to the standard as mandatory. This ASTM procedure uses an extractive sampling system that routes stationary source effluent to an FTIR spectrometer for the identification and quantification of gaseous compounds. The test plan preparation and implementation in the Annexes to ASTM D 6348–03, Sections A1 through A8 are mandatory; therefore, the EPA incorporates by reference, ''Standard Test Method for Determination of Gaseous Compounds by Extractive Direct Interface Fourier Transform Infrared (FTIR) Spectroscopy.'' This ASTM procedure also uses an extractive sampling system and FTIR spectrometer for the identification and quantification of gaseous compounds. The percent (%) R must be determined for each target analyte (Equation A5.5) when using ASTM D6348–03, Annex A5 (Analyte Spiking Technique). In order for the test data to be acceptable for a compound, %R must be $70\% \geq R \leq 130\%$. If the %R value does not meet this criterion for a target compound, the test data is not acceptable for that compound and the test must be repeated for that analyte (*i.e.,* the sampling and/or analytical procedure should be adjusted before a retest). The %R value for each compound must be reported in the test report, and all field measurements must be corrected with the calculated %R value for that compound by using the following equation:

Reported Results = (Measured Concentration in the Stack × 100)/ %R.

The three ASTM methods (ASTM D6420–18, ASTM D6348–12e1, and ASTM D 6348–03) newly incorporated by reference in this rule are available to the public for free viewing online in the Reading Room section on ASTM's website at *https://www.astm.org/READINGLIBRARY/.* In addition to this free online viewing availability on ASTM's website, hard copies and printable versions are available for purchase from ASTM at *http://www.astm.org/.*

Also, the EPA decided not to include 17 other VCS; these methods are impractical as alternatives because of the lack of equivalency, documentation, validation date, and other important technical and policy considerations. The search and review results have been documented and are in the memorandum, *Voluntary Consensus Standard Results for National Emission Standards for Hazardous Air Pollutants for Ethylene Production RTR,* which is available in the docket for this action.

Under 40 CFR 63.7(f) and 40 CFR 63.8(f) (in subpart A—General Provisions), a source may apply to the EPA for permission to use alternative test methods or alternative monitoring requirements in place of any required testing methods, performance specifications, or procedures in the final rule or any amendments.

Finally, although not considered a VCS, the EPA incorporates by reference, ''Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry (GC/MS)'' (SW–846–8260B) and ''Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry (GC/MS)'' (SW–846–8270D) into 40 CFR 63.1107(a); and ''Air Stripping Method (Modified El Paso

Method) for Determination of Volatile Organic Compound Emissions from Water Sources,'' into 40 CFR 63.1086(e) and 40 CFR 63.1089(d). Each of these methods is used to identify organic HAP in water; however, SW–846–8260B and SW–846–8270D use water sampling techniques and the Modified El Paso Method uses an air stripping sampling technique. The SW–846 methods are available from the EPA at *https://www.epa.gov/hw-sw846* while the Modified El Paso Method is available from TCEQ at *https://www.tceq.texas.gov/assets/public/compliance/field_ops/guidance/samplingappp.pdf.*

K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes that this action does not have disproportionately high and adverse human health or environmental effects on minority populations, low-income populations, and/or indigenous peoples, as specified in Executive Order 12898 (59 FR 7629, February 16, 1994).

The documentation for this decision is contained in section IV.A of this preamble and in the technical report, *Risk and Technology Review—Analysis of Demographic Factors for Populations Living Near Ethylene Production Source Category Operations,* available in the docket for this action.

L. Congressional Review Act (CRA)

This action is subject to the CRA, and the EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action is not a ''major rule'' as defined by 5 U.S.C. 804(2).

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedures, Air pollution control, Hazardous substances, Incorporation by reference, Intergovernmental relations, Reporting and recordkeeping requirements.

Dated: March 12, 2020.

Andrew R. Wheeler,

Administrator.

For the reasons set forth in the preamble, the EPA is amending 40 CFR part 63 as follows:

PART 63—NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401, *et seq.*

Subpart A—General Provisions

■ 2. Section 63.14 is amended by:
■ a. Revising paragraphs (e)(1) and (h)(18), (83), and (85);
■ b. Redesignating paragraphs (h)(92) through (112) as paragraphs (h)(93) through (113);
■ c. Adding new paragraph (h)(92);
■ d. Revising paragraphs (n)(12) and (13); and
■ e. Revising paragraph (t)(1).

The revisions and addition read as follows:

§ 63.14 Incorporations by reference.

* * * * *

(e) * * *

(1) ANSI/ASME PTC 19.10–1981, Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus], issued August 31, 1981, IBR approved for §§ 63.309(k), 63.457(k), 63.772(e) and (h), 63.865(b), 63.997(e), 63.1282(d) and (g), 63.1625(b), 63.3166(a), 63.3360(e), 63.3545(a), 63.3555(a), 63.4166(a), 63.4362(a), 63.4766(a), 63.4965(a), 63.5160(d), table 4 to subpart UUUU, table 3 to subpart YYYY, 63.9307(c), 63.9323(a), 63.11148(e), 63.11155(e), 63.11162(f), 63.11163(g), 63.11410(j), 63.11551(a), 63.11646(a), and 63.11945, table 5 to subpart DDDDD, table 4 to subpart JJJJJ, table 4 to subpart KKKKK, tables 4 and 5 of subpart UUUUU, table 1 to subpart ZZZZZ, and table 4 to subpart JJJJJJ.

* * * * *

(h) * * *

(18) ASTM D1946–90 (Reapproved 1994), Standard Method for Analysis of Reformed Gas by Gas Chromatography, 1994, IBR approved for §§ 63.11(b), 63.987(b), and 63.1412.

* * * * *

(83) ASTM D6348–03, Standard Test Method for Determination of Gaseous Compounds by Extractive Direct Interface Fourier Transform Infrared (FTIR) Spectroscopy, including Annexes A1 through A8, Approved October 1, 2003, IBR approved for §§ 63.457(b), 63.997(e), and 63.1349, table 4 to subpart DDDD, table 4 to subpart UUUU, table 4 subpart ZZZZ, and table 8 to subpart HHHHHHH.

* * * * *

(85) ASTM D6348–12e1, Standard Test Method for Determination of Gaseous Compounds by Extractive Direct Interface Fourier Transform Infrared (FTIR) Spectroscopy, Approved February 1, 2012, IBR approved for §§ 63.997(e) and 63.1571(a) and Table 4 to subpart UUUU.

* * * * *

(92) ASTM D6420–18, Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry, Approved November 1, 2018, IBR approved for § 63.987(b) and § 63.997(e).

* * * * *

(n) * * *

(12) SW–846–8260B, Volatile Organic Compounds by Gas Chromatography/Mass Spectrometry (GC/MS), Revision 2, December 1996, in EPA Publication No. SW–846, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, Third Edition, IBR approved for §§ 63.1107(a), 63.11960, 63.11980, and table 10 to subpart HHHHHHH.

(13) SW–846–8270D, Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry (GC/MS), Revision 4, February 2007, in EPA Publication No. SW–846, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, Third Edition, IBR approved for §§ 63.1107(a), 63.11960, 63.11980, and table 10 to subpart HHHHHHH.

(1) ''Air Stripping Method (Modified El Paso Method) for Determination of Volatile Organic Compound Emissions from Water Sources,'' Revision Number One, dated January 2003, Sampling Procedures Manual, Appendix P: Cooling Tower Monitoring, January 31, 2003, IBR approved for §§ 63.654(c) and (g), 63.655(i), 63.1086(e), 63.1089(d), and 63.11920.

* * * * *

Subpart SS—National Emission Standards for Closed Vent Systems, Control Devices, Recovery Devices and Routing to a Fuel Gas System or a Process

■ 3. Section 63.987 is amended by revising parameter ''Dj'' of Equation 1 in paragraph (b)(3)(ii) to read as follows:

§ 63.987 Flare requirements.

* * * * *

(b) * * *

(3) * * *

(ii) * * *

* * * * *

Dj = Concentration of sample component j, in parts per million by volume on a wet basis, as measured for organics by Method 18 of 40 CFR part 60, appendix A, or by ASTM D6420–18 (incorporated by reference, see § 63.14) under the conditions specified in § 63.997(e)(2)(iii)(D)(*1*) through (*3*). Hydrogen and carbon monoxide are measured by ASTM D1946–90

(Reapproved 1994) (incorporated by reference, see § 63.14); and

* * * * *

■ 4. Section 63.997 is amended by revising paragraphs (e)(2)(iii) introductory text, (e)(2)(iii)(C)(*1*), (e)(2)(iii)(D), (e)(2)(iv) introductory text, and (e)(2)(iv)(F) and (I) to read as follows:

§ 63.997 Performance test and compliance assessment requirements for control devices.

* * * * *

(e) * * *

(2) * * *

(iii) *Total organic regulated material or TOC concentration.* To determine compliance with a parts per million by volume total organic regulated material or TOC limit, the owner or operator shall use Method 18 or 25A of 40 CFR part 60, appendix A, as applicable. The ASTM D6420–18 (incorporated by reference, see § 63.14) may be used in lieu of Method 18 of 40 CFR part 60, appendix A, under the conditions specified in paragraphs (e)(2)(iii)(D)(*1*) through (*3*) of this section. Alternatively, any other method or data that have been validated according to the applicable procedures in Method 301 of appendix A to this part may be used. The procedures specified in paragraphs (e)(2)(iii)(A), (B), (D), and (E) of this section shall be used to calculate parts per million by volume concentration. The calculated concentration shall be corrected to 3 percent oxygen using the procedures specified in paragraph (e)(2)(iii)(C) of this section if a combustion device is the control device and supplemental combustion air is used to combust the emissions.

* * * * *

(C) * * *

(*1*) The emission rate correction factor (or excess air), integrated sampling and analysis procedures of Method 3B of 40 CFR part 60, appendix A, or the manual method in ANSI/ASME PTC 19.10–1981—Part 10 (incorporated by reference, see § 63.14), shall be used to determine the oxygen concentration. The sampling site shall be the same as that of the organic regulated material or organic compound samples, and the samples shall be taken during the same time that the organic regulated material or organic compound samples are taken.

* * * * *

(D) To measure the total organic regulated material concentration at the outlet of a control device, use Method 18 of 40 CFR part 60, appendix A, or ASTM D6420–18 (incorporated by reference, see § 63.14). If you have a combustion control device, you must first determine which regulated material compounds are present in the inlet gas stream using process knowledge or the screening procedure described in Method 18. In conducting the performance test, analyze samples collected at the outlet of the combustion control device as specified in Method 18 or ASTM D6420–18 for the regulated material compounds present at the inlet of the control device. The method ASTM D6420–18 may be used only under the conditions specified in paragraphs (e)(2)(iii)(D)(*1*) through (*3*) of this section.

(*1*) If the target compounds are all known and are all listed in Section 1.1 of ASTM D6420–18 as measurable.

(*2*) ASTM D6420–18 may not be used for methane and ethane.

(*3*) ASTM D6420–18 may not be used as a total VOC method.

* * * * *

(iv) *Percent reduction calculation.* To determine compliance with a percent reduction requirement, the owner or operator shall use Method 18, 25, or 25A of 40 CFR part 60, appendix A, as applicable. The method ASTM D6420–18 (incorporated by reference, see § 63.14) may be used in lieu of Method 18 of 40 CFR part 60, appendix A, under the conditions specified in paragraphs (e)(2)(iii)(D)(*1*) through (*3*) of this section. Alternatively, any other method or data that have been validated according to the applicable procedures in Method 301 of appendix A to this part may be used. The procedures specified in paragraphs (e)(2)(iv)(A) through (I) of this section shall be used to calculate percent reduction efficiency.

* * * * *

(F) To measure inlet and outlet concentrations of total organic regulated material, use Method 18 of 40 CFR part 60, appendix A, or ASTM D6420–18 (incorporated by reference, see § 63.14), under the conditions specified in paragraphs (e)(2)(iii)(D)(*1*) through (*3*) of this section. In conducting the performance test, collect and analyze samples as specified in Method 18 or ASTM D6420–18. You must collect samples simultaneously at the inlet and outlet of the control device. If the performance test is for a combustion control device, you must first determine which regulated material compounds are present in the inlet gas stream (*i.e.,* uncontrolled emissions) using process knowledge or the screening procedure described in Method 18. Quantify the emissions for the regulated material compounds present in the inlet gas stream for both the inlet and outlet gas streams for the combustion device.

* * * * *

(I) If the uncontrolled or inlet gas stream to the control device contains formaldehyde, you must conduct emissions testing according to paragraphs (e)(2)(iv)(I)(*1*) through (*3*) of this section.

(*1*) Except as specified in paragraph (e)(2)(iv)(I)(*3*) of this section, if you elect to comply with a percent reduction requirement and formaldehyde is the principal regulated material compound (*i.e.,* greater than 50 percent of the regulated material compounds in the stream by volume), you must use Method 316 or 320 of appendix A to this part, to measure formaldehyde at the inlet and outlet of the control device. Use the percent reduction in formaldehyde as a surrogate for the percent reduction in total regulated material emissions.

(*2*) Except as specified in paragraph (e)(2)(iv)(I)(*3*) of this section, if you elect to comply with an outlet total organic regulated material concentration or TOC concentration limit, and the uncontrolled or inlet gas stream to the control device contains greater than 10 percent (by volume) formaldehyde, you must use Method 316 or 320 of appendix A to this part, to separately determine the formaldehyde concentration. Calculate the total organic regulated material concentration or TOC concentration by totaling the formaldehyde emissions measured using Method 316 or 320 and the other regulated material compound emissions measured using Method 18 or 25/25A of 40 CFR part 60, appendix A.

(*3*) You may elect to use ASTM D6348–12e1 (incorporated by reference, § 63.14) in lieu of Method 316 or 320 of appendix A to this part as specified in paragraph (e)(2)(iv)(I)(*1*) or (*2*) of this section. To comply with this paragraph, the test plan preparation and implementation in the Annexes to ASTM D6348–03 (incorporated by reference, see § 63.14) Sections Al through A8 are mandatory; the percent (%) R must be determined for each target analyte using Equation A5.5 of ASTM D6348–03 Annex A5 (Analyte Spiking Technique); and in order for the test data to be acceptable for a compound, the %R must be $70\% \geq R \leq 130\%$. If the %R value does not meet this criterion for a target compound, then the test data is not acceptable for that compound and the test must be repeated for that analyte (*i.e.,* the sampling and/or analytical procedure should be adjusted before a retest). The %R value for each compound must be

reported in the test report, and all field measurements must be corrected with the calculated %R value for that compound by using the following equation:

Reported Results = (Measured Concentration in the Stack × 100)/ %R.

Subpart XX—National Emission Standards for Ethylene Manufacturing Process Units: Heat Exchange Systems and Waste Operations

■ 5. Section 63.1081 is revised to read as follows:

§ 63.1081 When must I comply with the requirements of this subpart?

You must comply with the requirements of this subpart according to the schedule specified in § 63.1102(a). Each heat exchange system which is part of an ethylene production affected source also must comply with paragraph (a) of this section. Each waste stream which is part of an ethylene production affected source also must comply with paragraph (b) of this section.

(a) Each heat exchange system that is part of an ethylene production affected source that commenced construction or reconstruction on or before October 9, 2019, must be in compliance with the heat exchange system requirements specified in §§ 63.1084(f), 63.1085(e) and (f), 63.1086(e), 63.1087(c) and (d), 63.1088(d), and 63.1089(d) and (e) upon initial startup or July 6, 2023, whichever is later. Each heat exchange system that is part of an ethylene production affected source that commences construction or reconstruction after October 9, 2019, must be in compliance with the heat exchange system requirements specified in §§ 63.1084(f), 63.1085(e) and (f), 63.1086(e), 63.1087(c) and (d), 63.1088(d), and 63.1089(d) and (e) upon initial startup, or July 6, 2020, whichever is later.

(b) Each waste stream that is part of an ethylene production affected source that commenced construction or reconstruction on or before October 9, 2019, must be in compliance with the flare requirements specified in § 63.1095(a)(1)(vi) and (b)(3) upon initial startup or July 6, 2023, whichever is later. Each waste stream that is part of an ethylene production affected source that commences construction or reconstruction after October 9, 2019, must be in compliance with the flare requirements specified in § 63.1095(a)(1)(vi) and (b)(3) upon initial startup, or July 6, 2020, whichever is later.

■ 6. Section 63.1082 is amended in paragraph (b) by revising definitions for ''Dilution steam blowdown waste stream,'' and ''Spent caustic waste stream'' to read as follows:

§ 63.1082 What definitions do I need to know?

* * * * *

(b) * * *

Dilution steam blowdown waste stream means any continuously flowing process wastewater stream resulting from the quench and compression of cracked gas (the cracking furnace effluent) at an ethylene production unit and is discharged from the unit. This stream typically includes the aqueous or oily-water stream that results from condensation of dilution steam (in the cracking furnace quench system), blowdown from dilution steam generation systems, and aqueous streams separated from the process between the cracking furnace and the cracked gas dehydrators. The dilution steam blowdown waste stream does not include blowdown that has not contacted HAP-containing process materials. Before July 6, 2023, the dilution steam blowdown waste stream does not include dilution steam blowdown streams generated from sampling, maintenance activities, or shutdown purges. Beginning on July 6, 2023, the dilution steam blowdown streams generated from sampling, maintenance activities, or shutdown purges are included in the definition of dilution steam blowdown waste stream.

* * * * *

Spent caustic waste stream means the continuously flowing process wastewater stream that results from the use of a caustic wash system in an ethylene production unit. A caustic wash system is commonly used at ethylene production units to remove acid gases and sulfur compounds from process streams, typically cracked gas. Before July 6, 2023, the spent caustic waste stream does not include spent caustic streams generated from sampling, maintenance activities, or shutdown purges. Beginning on July 6, 2023, the spent caustic streams generated from sampling, maintenance activities, or shutdown purges are included in the definition of spent caustic waste stream.

■ 7. Section 63.1084 is amended by revising the introductory text and adding paragraph (f) to read as follows:

§ 63.1084 What heat exchange systems are exempt from the requirements of this subpart?

Except as specified in paragraph (f) of this section, your heat exchange system is exempt from the requirements in §§ 63.1085 and 63.1086 if it meets any one of the criteria in paragraphs (a) through (e) of this section.

* * * * *

(f) Beginning no later than the compliance dates specified in § 63.1081(a), your heat exchange system is no longer exempt from the requirements in §§ 63.1085 and 63.1086 if it meets the criteria in paragraph (c) or (d) of this section; instead, your heat exchange system is exempt from the requirements in §§ 63.1085 and 63.1086 if it meets any one of the criteria in paragraph (a), (b), or (e) of this section.

■ 8. Section 63.1085 is amended by revising the introductory text and paragraphs (a) and (b) and by adding paragraphs (e) and (f) to read as follows:

§ 63.1085 What are the general requirements for heat exchange systems?

Unless you meet one of the requirements for exemptions in § 63.1084, you must meet the requirements in paragraphs (a) through (f) of this section.

(a) Except as specified in paragraph (e) of this section, you must monitor the cooling water for the presence of substances that indicate a leak according to § 63.1086(a) through (d).

(b) Except as specified in paragraph (f) of this section, if you detect a leak, then you must repair it according to § 63.1087(a) and (b) unless repair is delayed according to § 63.1088(a) through (c).

* * * * *

(e) Beginning no later than the compliance dates specified in § 63.1081(a), the requirements specified in § 63.1086(a) through (d) no longer apply; instead, you must monitor the cooling water for the presence of total strippable hydrocarbons that indicate a leak according to § 63.1086(e). At any time before the compliance dates specified in § 63.1081(a), you may choose to comply with the requirements in this paragraph in lieu of the requirements in paragraph (a) of this section.

(f) Beginning no later than the compliance dates specified in § 63.1081(a), the requirements specified in §§ 63.1087(a) and (b) and 63.1088(a) through (c), no longer apply; instead, if you detect a leak, then you must repair it according to § 63.1087(c) and (d), unless repair is delayed according to § 63.1088(d). At any time before the compliance dates specified in § 63.1081(a), you may choose to comply with the requirements in this paragraph in lieu of the requirements in paragraph (b) of this section.

■ 9. Section 63.1086 is amended by revising the introductory text and by adding paragraph (e) to read as follows:

§ 63.1086 How must I monitor for leaks to cooling water?

Except as specified in § 63.1085(e) and paragraph (e) of this section, you must monitor for leaks to cooling water by monitoring each heat exchange system according to the requirements of paragraph (a) of this section, monitoring each heat exchanger according to the requirements of paragraph (b) of this section, or monitoring a surrogate parameter according to the requirements of paragraph (c) of this section. Except as specified in § 63.1085(e) and paragraph (e) of this section, if you elect to comply with the requirements of paragraph (a) or (b) of this section, you may use alternatives in paragraph (d)(1) or (2) of this section for determining the mean entrance concentration.

* * * * *

(e) Beginning no later than the compliance dates specified in § 63.1081(a), you must perform monitoring to identify leaks of total strippable hydrocarbons from each heat exchange system subject to the requirements of this subpart according to the procedures in paragraphs (e)(1) through (5) of this section.

(1) *Monitoring locations for closed-loop recirculation heat exchange systems.* For each closed loop recirculating heat exchange system, you must collect and analyze a sample from the location(s) described in either paragraph (e)(1)(i) or (ii) of this section.

(i) Each cooling tower return line or any representative riser within the cooling tower prior to exposure to air for each heat exchange system.

(ii) Selected heat exchanger exit line(s), so that each heat exchanger or group of heat exchangers within a heat exchange system is covered by the selected monitoring location(s).

(2) *Monitoring locations for once-through heat exchange systems.* For each once-through heat exchange system, you must collect and analyze a sample from the location(s) described in paragraph (e)(2)(i) of this section. You may also elect to collect and analyze an additional sample from the location(s) described in paragraph (e)(2)(ii) of this section.

(i) Selected heat exchanger exit line(s), so that each heat exchanger or group of heat exchangers within a heat exchange system is covered by the selected monitoring location(s). The selected monitoring location may be at a point where discharges from multiple heat exchange systems are combined provided that the combined cooling water flow rate at the monitoring location does not exceed 165,000 gallons per minute.

(ii) The inlet water feed line for a once-through heat exchange system prior to any heat exchanger. If multiple heat exchange systems use the same water feed (*i.e.,* inlet water from the same primary water source), you may monitor at one representative location and use the monitoring results for that sampling location for all heat exchange systems that use that same water feed.

(3) *Monitoring method.* If you comply with the total strippable hydrocarbon concentration leak action level as specified in paragraph (e)(4) of this section, you must comply with the requirements in paragraph (e)(3)(i) of this section. If you comply with the total hydrocarbon mass emissions rate leak action level as specified in paragraph (e)(4) of this section, you must comply with the requirements in paragraphs (e)(3)(i) and (ii) of this section.

(i) You must determine the total strippable hydrocarbon concentration (in parts per million by volume (ppmv) as methane) at each monitoring location using the ''Air Stripping Method (Modified El Paso Method) for Determination of Volatile Organic Compound Emissions from Water Sources'' (incorporated by reference, see § 63.14) using a flame ionization detector analyzer for on-site determination as described in Section 6.1 of the Modified El Paso Method.

(ii) You must convert the total strippable hydrocarbon concentration (in ppmv as methane) to a total hydrocarbon mass emissions rate (as methane) using the calculations in Section 7.0 of ''Air Stripping Method (Modified El Paso Method) for Determination of Volatile Organic Compound Emissions from Water Sources'' (incorporated by reference—see § 63.14).

(4) *Monitoring frequency and leak action level.* For each heat exchange system, you must comply with the applicable monitoring frequency and leak action level, as defined in paragraphs (e)(4)(i) through (iii) of this section. The monitoring frequencies specified in paragraphs (e)(4)(i) through (iii) of this section also apply to the inlet water feed line for a once-through heat exchange system, if you elect to monitor the inlet water feed as provided in paragraph (e)(2)(ii) of this section.

(i) For each heat exchange system that is part of an ethylene production affected source that commenced construction or reconstruction on or before December 6, 2000, you must monitor quarterly using a leak action level defined as a total strippable hydrocarbon concentration (as methane) in the stripping gas of 6.2 ppmv or, for heat exchange systems with a recirculation rate of 10,000 gallons per minute or less, you may monitor quarterly using a leak action level defined as a total hydrocarbon mass emissions rate from the heat exchange system (as methane) of 0.18 kg/hr. If a leak is detected as specified in paragraph (e)(5) of this section, then you must monitor monthly until the leak has been repaired according to the requirements in § 63.1087(c) or (d). Once the leak has been repaired according to the requirements in § 63.1087(c) or (d), quarterly monitoring for the heat exchange system may resume.

(ii) For each heat exchange system that is part of an ethylene production affected source that commences construction or reconstruction after December 6, 2000 and on or before October 9, 2019, you must monitor at the applicable frequency specified in paragraph (e)(4)(ii)(A) or (B) of this section using a leak action level defined as a total strippable hydrocarbon concentration (as methane) in the stripping gas of 6.2 ppmv or, for heat exchange systems with a recirculation rate of 10,000 gallons per minute or less, you may monitor at the applicable frequency specified in paragraph (e)(4)(ii)(A) or (B) of this section using a leak action level defined as a total hydrocarbon mass emissions rate from the heat exchange system (as methane) of 0.18 kg/hr.

(A) If you have completed the initial weekly monitoring for 6-months of the heat exchange system as specified in § 63.1086(a)(2)(ii) or (b)(1)(ii) then you must monitor monthly. If a leak is detected as specified in paragraph (e)(5) of this section, then you must monitor weekly until the leak has been repaired according to the requirements in § 63.1087(c) or (d). Once the leak has been repaired according to the requirements in § 63.1087(c) or (d), monthly monitoring for the heat exchange system may resume.

(B) If you have not completed the initial weekly monitoring for 6-months of the heat exchange system as specified in § 63.1086(a)(2)(ii) or (b)(1)(ii), or if you elect to comply with paragraph (e) of this section rather than paragraphs (a) through (d) of this section upon startup, then you must initially monitor weekly for 6-months beginning upon startup and monitor monthly thereafter. If a leak is detected as specified in paragraph (e)(5) of this section, then you must monitor weekly until the leak has been repaired according to the requirements in § 63.1087(c) or (d). Once the leak has

been repaired according to the requirements in § 63.1087(c) or (d), monthly monitoring for the heat exchange system may resume.

(iii) For each heat exchange system that is part of an ethylene production affected source that commences construction or reconstruction after October 9, 2019, you must initially monitor weekly for 6-months beginning upon startup and monitor monthly thereafter using a leak action level defined as a total strippable hydrocarbon concentration (as methane) in the stripping gas of 6.2 ppmv or, for heat exchange systems with a recirculation rate of 10,000 gallons per minute or less, you may use a leak action level defined as a total hydrocarbon mass emissions rate from the heat exchange system (as methane) of 0.18 kg/hr if the heat exchange system has a recirculation rate of 10,000 gallons per minute or less. If a leak is detected as specified in paragraph (e)(5) of this section, then you must monitor weekly until the leak has been repaired according to the requirements in § 63.1087(c) or (d). Once the leak has been repaired according to the requirements in § 63.1087(c) or (d), monthly monitoring for the heat exchange system may resume.

(5) *Leak definition.* A leak is defined as described in paragraph (e)(5)(i) or (ii) of this section, as applicable.

(i) For once-through heat exchange systems for which the inlet water feed is monitored as described in paragraph (e)(2)(ii) of this section, a leak is detected if the difference in the measurement value of the sample taken from a location specified in paragraph (e)(2)(i) of this section and the measurement value of the corresponding sample taken from the location specified in paragraph (e)(2)(ii) of this section equals or exceeds the leak action level.

(ii) For all other heat exchange systems, a leak is detected if a measurement value of the sample taken from a location specified in paragraph (e)(1)(i), (ii), or (e)(2)(i) of this section equals or exceeds the leak action level.

■ 10. Section 63.1087 is amended by revising the introductory text and by adding paragraphs (c) and (d) to read as follows:

§ 63.1087 What actions must I take if a leak is detected?

Except as specified in § 63.1085(f) and paragraphs (c) and (d) of this section, if a leak is detected, you must comply with the requirements in paragraphs (a) and (b) of this section unless repair is delayed according to § 63.1088.

* * * * *

(c) Beginning no later than the compliance dates specified in § 63.1081(a), if a leak is detected using the methods described in § 63.1086(e), you must repair the leak to reduce the concentration or mass emissions rate to below the applicable leak action level as soon as practicable, but no later than 45 days after identifying the leak, except as specified in § 63.1088(d). Repair must include re-monitoring at the monitoring location where the leak was identified according to the method specified in § 63.1086(e)(3) to verify that the total strippable hydrocarbon concentration or total hydrocarbon mass emissions rate is below the applicable leak action level. Repair may also include performing the additional monitoring in paragraph (d) of this section to verify that the total strippable hydrocarbon concentration is below the applicable leak action level. Actions that can be taken to achieve repair include but are not limited to:

(1) Physical modifications to the leaking heat exchanger, such as welding the leak or replacing a tube;

(2) Blocking the leaking tube within the heat exchanger;

(3) Changing the pressure so that water flows into the process fluid;

(4) Replacing the heat exchanger or heat exchanger bundle; or

(5) Isolating, bypassing, or otherwise removing the leaking heat exchanger from service until it is otherwise repaired.

(d) Beginning no later than the compliance dates specified in § 63.1081(a), if you detect a leak when monitoring a cooling tower return line according to § 63.1086(e)(1)(i), you may conduct additional monitoring of each heat exchanger or group of heat exchangers associated with the heat exchange system for which the leak was detected, as provided in § 63.1086(e)(1)(ii). If no leaks are detected when monitoring according to the requirements of § 63.1086(e)(1)(ii), the heat exchange system is considered to have met the repair requirements through re-monitoring of the heat exchange system, as provided in paragraph (c) of this section.

■ 11. Section 63.1088 is amended by revising the introductory text and by adding paragraph (d) to read as follows:

§ 63.1088 In what situations may I delay leak repair, and what actions must I take for delay of repair?

You may delay the repair of heat exchange systems if the leaking equipment is isolated from the process. At any time before the compliance dates specified in § 63.1081(a), you may also delay repair if repair is technically infeasible without a shutdown, and you meet one of the conditions in paragraphs (a) through (c) of this section. Beginning no later than the compliance dates specified in § 63.1081(a), paragraphs (a) through (c) of this section no longer apply; instead, you may delay repair if the conditions in paragraph (d) of this section are met.

* * * * *

(d) Beginning no later than the compliance dates specified in § 63.1081(a), you may delay repair when one of the conditions in paragraph (d)(1) or (2) of this section is met and the leak is less than the delay of repair action level specified in paragraph (d)(3) of this section. You must determine if a delay of repair is necessary as soon as practicable, but no later than 45 days after first identifying the leak.

(1) If the repair is technically infeasible without a shutdown and the total strippable hydrocarbon concentration or total hydrocarbon mass emissions rate is initially and remains less than the delay of repair action level for all monitoring periods during the delay of repair, then you may delay repair until the next scheduled shutdown of the heat exchange system. If, during subsequent monitoring, the delay of repair action level is exceeded, then you must repair the leak within 30 days of the monitoring event in which the leak was equal to or exceeded the delay of repair action level.

(2) If the necessary equipment, parts, or personnel are not available and the total strippable hydrocarbon concentration or total hydrocarbon mass emissions rate is initially and remains less than the delay of repair action level for all monitoring periods during the delay of repair, then you may delay the repair for a maximum of 120 calendar days. You must demonstrate that the necessary equipment, parts, or personnel were not available. If, during subsequent monitoring, the delay of repair action level is exceeded, then you must repair the leak within 30 days of the monitoring event in which the leak was equal to or exceeded the delay of repair action level.

(3) The delay of repair action level is a total strippable hydrocarbon concentration (as methane) in the stripping gas of 62 ppmv or, for heat exchange systems with a recirculation rate of 10,000 gallons per minute or less, the delay of repair action level is a total hydrocarbon mass emissions rate (as methane) or 1.8 kg/hr. The delay of repair action level is assessed as described in paragraph (d)(3)(i) or (ii) of this section, as applicable.

(i) For once-through heat exchange systems for which the inlet water feed

is monitored as described in § 63.1086(e)(2)(ii), the delay of repair action level is exceeded if the difference in the measurement value of the sample taken from a location specified in § 63.1086(e)(2)(i) and the measurement value of the corresponding sample taken from the location specified in § 63.1086(e)(2)(ii) equals or exceeds the delay of repair action level.

(ii) For all other heat exchange systems, the delay of repair action level is exceeded if a measurement value of the sample taken from a location specified in § 63.1086(e)(1)(i) and (ii) or § 63.1086(e)(2)(i) equals or exceeds the delay of repair action level.

■ 12. Section 63.1089 is amended by revising paragraphs (d) and (e) to read as follows:

§ 63.1089 What records must I keep?

* * * * *

(d) At any time before the compliance dates specified in § 63.1081(a), you must keep documentation of delay of repair as specified in § 63.1088(a) through (c). Beginning no later than the compliance dates specified in § 63.1081(a), the requirement to keep documentation of delay of repair as specified in § 63.1088(a) through (c) no longer applies; instead, you must keep documentation of delay of repair as specified in paragraphs (d)(1) through (4) of this section.

(1) The reason(s) for delaying repair.

(2) A schedule for completing the repair as soon as practical.

(3) The date and concentration or mass emissions rate of the leak as first identified and the results of all subsequent monitoring events during the delay of repair.

(4) An estimate of the potential total hydrocarbon emissions from the leaking heat exchange system or heat exchanger for each required delay of repair monitoring interval following the applicable procedures in paragraphs (d)(4)(i) through (iii) of this section.

(i) If you comply with the total strippable hydrocarbon concentration leak action level, as specified in § 63.1086(e)(4), you must calculate the mass emissions rate by complying with the requirements of § 63.1086(e)(3)(ii) or by determining the mass flow rate of the cooling water at the monitoring location where the leak was detected. If the monitoring location is an individual cooling tower riser, determine the total cooling water mass flow rate to the cooling tower. Cooling water mass flow rates may be determined using direct measurement, pump curves, heat balance calculations, or other engineering methods. If you determine the mass flow rate of the cooling water, calculate the mass emissions rate by converting the stripping gas leak concentration (in ppmv as methane) to an equivalent liquid concentration, in parts per million by weight (ppmw), using equation 7–1 from ''Air Stripping Method (Modified El Paso Method) for Determination of Volatile Organic Compound Emissions from Water Sources'' (incorporated by reference—see § 63.14) and multiply the equivalent liquid concentration by the mass flow rate of the cooling water.

(ii) For delay of repair monitoring intervals prior to repair of the leak, calculate the potential total hydrocarbon emissions for the leaking heat exchange system or heat exchanger for the monitoring interval by multiplying the mass emissions rate, determined in § 63.1086(e)(3)(ii) or paragraph (d)(4)(i) of this section, by the duration of the delay of repair monitoring interval. The duration of the delay of repair monitoring interval is the time period starting at midnight on the day of the previous monitoring event or at midnight on the day the repair would have been completed if the repair had not been delayed, whichever is later, and ending at midnight of the day the of the current monitoring event.

(iii) For delay of repair monitoring intervals ending with a repaired leak, calculate the potential total hydrocarbon emissions for the leaking heat exchange system or heat exchanger for the final delay of repair monitoring interval by multiplying the duration of the final delay of repair monitoring interval by the mass emissions rate determined for the last monitoring event prior to the re-monitoring event used to verify the leak was repaired. The duration of the final delay of repair monitoring interval is the time period starting at midnight of the day of the last monitoring event prior to re-monitoring to verify the leak was repaired and ending at the time of the re-monitoring event that verified that the leak was repaired.

(e) At any time before the compliance dates specified in § 63.1081(a), if you validate a 40 CFR part 136 method for the HAP listed in Table 1 to this subpart according to the procedures in appendix D to this part, then you must keep a record of the test data and calculations used in the validation. On the compliance dates specified in § 63.1081(a), this requirement no longer applies.

■ 13. Section 63.1090 is amended by revising the introductory text and by adding paragraph (f) to read as follows:

§ 63.1090 What reports must I submit?

If you delay repair for your heat exchange system, you must report the delay of repair in the semiannual report required by § 63.1110(e). If the leak remains unrepaired, you must continue to report the delay of repair in semiannual reports until you repair the leak. Except as provided in paragraph (f) of this section, you must include the information in paragraphs (a) through (e) of this section in the semiannual report.

* * * * *

(f) For heat exchange systems subject to § 63.1085(e) and (f), Periodic Reports must include the information specified in paragraphs (f)(1) through (5) of this section, in lieu of the information specified in paragraphs (a) through (e) of this section.

(1) The number of heat exchange systems at the plant site subject to the monitoring requirements in § 63.1085(e) and (f) during the reporting period.

(2) The number of heat exchange systems subject to the monitoring requirements in § 63.1085(e) and (f) at the plant site found to be leaking during the reporting period.

(3) For each monitoring location where the total strippable hydrocarbon concentration or total hydrocarbon mass emissions rate was determined to be equal to or greater than the applicable leak definitions specified in § 63.1086(e)(5) during the reporting period, identification of the monitoring location (*e.g.,* unique monitoring location or heat exchange system ID number), the measured total strippable hydrocarbon concentration or total hydrocarbon mass emissions rate, the date the leak was first identified, and, if applicable, the date the source of the leak was identified;

(4) For leaks that were repaired during the reporting period (including delayed repairs), identification of the monitoring location associated with the repaired leak, the total strippable hydrocarbon concentration or total hydrocarbon mass emissions rate measured during re-monitoring to verify repair, and the re-monitoring date (*i.e.,* the effective date of repair); and

(5) For each delayed repair, identification of the monitoring location associated with the leak for which repair is delayed, the date when the delay of repair began, the date the repair is expected to be completed (if the leak is not repaired during the reporting period), the total strippable hydrocarbon concentration or total hydrocarbon mass emissions rate and date of each monitoring event conducted on the delayed repair during the reporting period, and an estimate of the potential total hydrocarbon emissions over the reporting period associated with the delayed repair.

■ 14. Section 63.1095 is amended by:
■ a. Revising paragraph (a)(1) introductory text;
■ b. Adding paragraph (a)(1)(vi);
■ c. Revising paragraphs (a)(3), (b) introductory text, and (b)(1); and
■ d. Adding paragraph (b)(3).

The revisions and additions read as follows:

§ 63.1095 What specific requirements must I comply with?

* * * * *

(a) * * *

(1) Route the continuous butadiene stream to a treatment process or wastewater treatment system used to treat benzene waste streams that complies with the standards specified in 40 CFR 61.348. Comply with the requirements of 40 CFR part 61, subpart FF; with the changes in Table 2 to this subpart, and as specified in paragraphs (a)(1)(i) through (vi) of this section.

* * * * *

(vi) Beginning no later than the compliance dates specified in § 63.1081(b), if you use a steam-assisted, air-assisted, non-assisted, or pressure-assisted multi-point flare to comply with 40 CFR part 61, subpart FF, then you must comply with the requirements § 63.1103(e)(4) in lieu of 40 CFR 61.349(a)(2)(iii) and (d), 40 CFR 61.354(c)(3), 40 CFR 61.356(f)(2)(i)(D) and (j)(7), and 40 CFR 61.357(d)(7)(iv)(F).

* * * * *

(3) Before July 6, 2023, if the total annual benzene quantity from waste at your facility is less than 10 Mg/yr, as determined according to 40 CFR 61.342(a), comply with the requirements of this section at all times except during periods of startup, shutdown, and malfunction, if the startup, shutdown, or malfunction precludes the ability of the affected source to comply with the requirements of this section and the owner or operator follows the provisions for periods of startup, shutdown, and malfunction, as specified in § 63.1111. Beginning on July 6, 2023, if the total annual benzene quantity from waste at your facility is less than 10 Mg/yr, as determined according to 40 CFR 61.342(a), you must comply with the requirements of this section at all times.

(b) *Waste streams that contain benzene.* For waste streams that contain benzene, you must comply with the requirements of 40 CFR part 61, subpart FF, except as specified in Table 2 to this subpart and paragraph (b)(3) of this section. You must manage and treat waste streams that contain benzene as specified in either paragraph (b)(1) or (2) of this section.

(1) If the total annual benzene quantity from waste at your facility is less than 10 Mg/yr, as determined according to 40 CFR 61.342(a), manage and treat spent caustic waste streams and dilution steam blowdown waste streams according to 40 CFR 61.342(c)(1) through (c)(3)(i). Before July 6, 2023, the requirements of this paragraph (b)(1) shall apply at all times except during periods of startup, shutdown, and malfunction, if the startup, shutdown, or malfunction precludes the ability of the affected source to comply with the requirements of this section and the owner or operator follows the provisions for periods of startup, shutdown, and malfunction, as specified in § 63.1111. Beginning on July 6, 2023, the requirements of this paragraph (b)(1) shall apply at all times.

* * * * *

(3) Beginning no later than the compliance dates specified in § 63.1081(b), if you use a steam-assisted, air-assisted, non-assisted, or pressure-assisted multi-point flare to comply with 40 CFR part 61, subpart FF, then you must comply with the requirements of § 63.1103(e)(4) in lieu of 40 CFR 61.349(a)(2)(iii) and (d), 40 CFR 61.354(c)(3), 40 CFR 61.356(f)(2)(i)(D) and (j)(7), and 40 CFR 61.357(d)(7)(iv)(F).

■ 15. Table 2 to subpart XX of part 63 is amended by revising the first three entries to row 1 and the first two entries to row 2 to read as follows:

TABLE 2 TO SUBPART XX OF PART 63—REQUIREMENTS OF 40 CFR PART 61, SUBPART FF, NOT INCLUDED IN THE REQUIREMENTS FOR THIS SUBPART AND ALTERNATE REQUIREMENTS

If the total annual benzene quantity for waste from your facility is * * *	Do not comply with:	Instead, comply with:
1. Less than 10 Mg/yr	40 CFR 61.340	§ 63.1093.
	40 CFR 61.342(c)(3)(ii), (d), and (e)	There is no equivalent requirement.
	40 CFR 61.342(f)	§ 63.1096.
* *	* * *	* *
2. Greater than or equal to 10 Mg/yr	40 CFR 61.340	§ 63.1093.
	40 CFR 61.342(f)	§ 63.1096.
* *	* * *	* *

Subpart YY—National Emission Standards for Hazardous Air Pollutants for Source Categories: Generic Maximum Achievable Control Technology Standards

■ 16. Section 63.1100 is amended by:
■ a. Revising the heading to Table 1 to § 63.1100(a);
■ b. Revising the entries for ''Carbon Black Production,'' ''Cyanide Chemicals Manufacturing,'' ''Ethylene Production,'' and ''Spandex Production'';
■ c. Revising footnote c to Table 1 to § 63.1100(a);
■ d. Revising paragraphs (b), (g) introductory text, and (g)(4)(ii);
■ e. Adding paragraph (g)(4)(iii);
■ f. Revising paragraph (g)(5); and
■ g. Adding paragraph (g)(7).

The revisions and additions read as follows:

§ 63.1100 Applicability.

(a) * * *

TABLE 1 TO § 63.1100(a)—SOURCE CATEGORY MACT [a] APPLICABILITY

Source category	Storage vessels	Process vents	Transfer racks	Equipment leaks	Wastewater streams	Other	Source category MACT requirements
* *		*	*		*	*	*
Carbon Black Production	No	Yes	No	No	No	No	§ 63.1103(f).
Cyanide Chemicals Manufacturing.	Yes	Yes	Yes	Yes	Yes	No	§ 63.1103(g).
Ethylene Production	Yes	Yes	Yes	Yes	Yes	Yes [c]	§ 63.1103(e).
* *		*	*		*	*	*
Spandex Production	Yes	Yes	No	No	No	Yes [d]	§ 63.1103(h).

[a] Maximum achievable control technology.
[b] Fiber spinning lines using spinning solution or suspension containing acrylonitrile.
[c] Heat exchange systems as defined in § 63.1082(b).
[d] Fiber spinning lines.

(b) *Subpart A requirements.* The following provisions of subpart A of this part (General Provisions), §§ 63.1 through 63.5, and §§ 63.12 through 63.15, apply to owners or operators of affected sources subject to this subpart. Beginning no later than the compliance dates specified in § 63.1102(c), for ethylene production affected sources, §§ 63.7(a)(4), (c), (e)(4), and (g)(2), and 63.10(b)(2)(vi) also apply.

* * * * *

(g) *Overlap with other regulations.* Paragraphs (g)(1) through (7) of this section specify the applicability of this subpart YY emission point requirements when other rules may apply. Where this subpart YY allows an owner or operator an option to comply with one or another regulation to comply with this subpart YY, an owner or operator must report which regulation they choose to comply with in the Notification of Compliance Status report required by § 63.1110(a)(4).

(4) * * *

(ii) After the compliance dates specified in § 63.1102, equipment that must be controlled according to this subpart YY and subpart H of this part is in compliance with the equipment leak requirements of this subpart YY if it complies with either set of requirements. For ethylene production affected sources, the requirement in § 63.1103(e)(9)(i) also applies. The owner or operator must specify the rule with which they will comply in the Notification of Compliance Status report required by § 63.1110(a)(4).

(iii) Beginning no later than the compliance dates specified in § 63.1102(c), for ethylene production affected sources, equipment that must be controlled according to this subpart YY and subpart VVa of 40 CFR part 60 is required only to comply with the equipment leak requirements of this subpart, except the owner or operator must also comply with the calibration drift assessment requirements specified at 40 CFR 60.485a(b)(2) if they are required to do so in subpart VVa of 40 CFR part 60. When complying with the calibration drift assessment requirements at 40 CFR 60.485a(b)(2), the requirement at 40 CFR 60.486a(e)(8)(v) to record the instrument reading for each scale used applies.

(5) *Overlap of this subpart YY with other regulations for wastewater for source categories other than ethylene production.* (i) After the compliance dates specified in § 63.1102 for an affected source subject to this subpart, a wastewater stream that is subject to the wastewater requirements of this subpart and the wastewater requirements of subparts F, G, and H of this part (collectively known as the ''HON'') shall be deemed to be in compliance with the requirements of this subpart if it complies with either set of requirements. In any instance where a source subject to this subpart is collocated with a Synthetic Organic Chemical Manufacturing Industry (SOCMI) source, and a single wastewater treatment facility treats both Group 1 wastewaters and wastewater residuals from the source subject to this subpart and wastewaters from the SOCMI source, a certification by the treatment facility that they will manage and treat the waste in conformity with the specific control requirements set forth in §§ 63.133 through 63.147 will also be deemed sufficient to satisfy the certification requirements for wastewater treatment under this subpart.

* * * * *

(7) *Overlap of this subpart YY with other regulations for flares for the ethylene production source category.* (i) Beginning no later than the compliance dates specified in § 63.1102(c), flares that are subject to 40 CFR 60.18 or § 63.11 and used as a control device for an emission point subject to the requirements in Table 7 to § 63.1103(e) are required to comply only with § 63.1103(e)(4). At any time before the compliance dates specified in § 63.1102(c), flares that are subject to 40 CFR 60.18 or § 63.11 and elect to comply with § 63.1103(e)(4) are required to comply only with § 63.1103(e)(4).

(ii) Beginning no later than the compliance dates specified in § 63.1102(c), flares subject to § 63.987 and used as a control device for an emission point subject to the requirements in Table 7 to § 63.1103(e) are only required to comply with § 63.1103(e)(4).

(iii) Beginning no later than the compliance dates specified in § 63.1102(c), flares subject to the requirements in 40 CFR part 63, subpart CC and used as a control device for an emission point subject to the requirements in Table 7 to § 63.1103(e) are only required to comply with the flare requirements in 40 CFR part 63, subpart CC. This paragraph does not apply to multi-point pressure assisted flares.

■ 17. Section 63.1101 is amended by revising the definitions of ''Pressure relief device or valve'' and ''Shutdown'' to read as follows:

§ 63.1101 Definitions.

* * * * *

Pressure relief device or valve means a safety device used to prevent operating pressures from exceeding the maximum allowable working pressure of the process equipment. A common pressure relief device is a spring-loaded pressure relief valve. Devices that are actuated either by a pressure of less than or equal to 2.5 pounds per square inch gauge or by a vacuum are not pressure relief devices. This definition does not apply to ethylene production affected sources.

* * * * *

Shutdown means the cessation of operation of an affected source or equipment that is used to comply with this subpart, or the emptying and degassing of a storage vessel. For the purposes of this subpart, shutdown includes, but is not limited to, periodic maintenance, replacement of equipment, or repair. Shutdown does not include the routine rinsing or washing of equipment in batch operation between batches. Shutdown includes the decoking of ethylene cracking furnaces.

* * * * *

■ 18. Section 63.1102 is amended by revising paragraph (a) introductory text and adding paragraph (c) to read as follows:

§ 63.1102 Compliance schedule.

(a) *General requirements.* Affected sources, as defined in § 63.1103(a)(1)(i) for acetyl resins production, § 63.1103(b)(1)(i) for acrylic and modacrylic fiber production, § 63.1103(c)(1)(i) for hydrogen fluoride production, § 63.1103(d)(1)(i) for polycarbonate production, § 63.1103(e)(1)(i) for ethylene production, § 63.1103(f)(1)(i) for carbon black production, § 63.1103(g)(1)(i) for cyanide chemicals manufacturing, or § 63.1103(h)(1)(i) for spandex production shall comply with the appropriate provisions of this subpart and the subparts referenced by this subpart YY according to the schedule in paragraph (a)(1) or (2) of this section, as appropriate, except as provided in paragraph (b) of this section. Affected sources in ethylene production also must comply according to paragraph (c) of this section. Proposal and effective dates are specified in Table 1 to this section.

* * * * *

(c) All ethylene production affected sources that commenced construction or reconstruction on or before October 9, 2019, must be in compliance with the requirements listed in paragraphs (c)(1) through (13) of this section upon initial startup or July 6, 2023, whichever is later. All ethylene production affected sources that commenced construction or reconstruction after October 9, 2019, must be in compliance with the requirements listed in paragraphs (c)(1) through (13) of this section upon initial startup, or July 6, 2020, whichever is later.

(1) Overlap requirements specified in § 63.1100(g)(4)(iii) and (7), if applicable.

(2) The storage vessel requirements specified in paragraphs (b)(1)(iii) and (c)(1)(ii) of Table 7 to § 63.1103(e), and the degassing requirements specified in § 63.1103(e)(10).

(3) The ethylene process vent requirements specified in paragraph (d)(1)(ii) of Table 7 to § 63.1103(e).

(4) The transfer rack requirements specified in § 63.1105(a)(5).

(5) The equipment requirements specified in paragraph (f)(1)(ii) of Table 7 to § 63.1103(e) and § 63.1107(h).

(6) The bypass line requirements specified in paragraph (i) of Table 7 to § 63.1103(e), and § 63.1103(e)(6).

(7) The decoking requirements for ethylene cracking furnaces specified in paragraph (j) of Table 7 to § 63.1103(e), and § 63.1103(e)(7) and (8).

(8) The flare requirements specified in § 63.1103(e)(4).

(9) The maintenance vent requirements specified in § 63.1103(e)(5).

(10) The requirements specified in § 63.1103(e)(9).

(11) The requirements in § 63.1108(a)(4)(i), (b)(1)(ii), (b)(2), and (b)(4)(ii)(B).

(12) The recordkeeping requirements specified in § 63.1109(e) through (i).

(13) The reporting requirements specified in § 63.1110(a)(10), (d)(1)(iv) and (v), and (e)(4) through (8).

* * * * *

■ 19. Section 63.1103 is amended:

■ a. By revising the definition of ''In organic hazardous air pollutant or in organic HAP service'' in paragraph (b)(2);

■ b. By revising paragraphs (e)(1)(i) introductory text, (e)(1)(i)(F), and (e)(1)(ii)(J);

■ c. In paragraph (e)(2) by;

■ i. Adding in alphabetical order a definition for ''Decoking operation'';

■ ii. Revising the definition of ''Ethylene process vent'';

■ iii. Adding in alphabetical order a definition for ''Force majeure event'';

■ iv. Removing the definition of ''Heat exchange system'';

■ v. Adding in alphabetical order definitions for ''Periodically discharged,'' ''Pressure-assisted multi-point flare,'' ''Pressure relief device,'' ''Radiant tube(s),'' and ''Relief valve'';

■ d. By revising paragraph (e)(3);

■ e. By adding paragraphs (e)(4) through (10); and

■ e. By revising Table 7 to § 63.1103(e).

The revisions and additions read as follows:

§ 63.1103 Source category-specific applicability, definitions, and requirements.

* * * * *

(b) * * *

(2) * * *

In organic hazardous air pollutant or in organic HAP service means, for acrylic and modacrylic fiber production affected sources, that a piece of equipment either contains or contacts a fluid (liquid or gas) that is at least 10 percent by weight of total organic HAP as determined according to the provisions of § 63.180(d). The provisions of § 63.180(d) also specify how to determine that a piece of equipment is not in organic HAP service.

* * * * *

(e) * * *

(1) * * *

(i) *Affected source.* For the ethylene production (as defined in paragraph (e)(2) of this section) source category, the affected source comprises all emission points listed in paragraphs (e)(1)(i)(A) through (G) of this section that are associated with an ethylene production unit that is located at a major source, as defined in section 112(a) of the Act.

* * * * *

(F) All heat exchange systems (as defined in § 63.1082(b)) associated with an ethylene production unit.

* * * * *

(ii) * * *

(J) Air emissions from all ethylene cracking furnaces.

* * * * *

(2) * * *

Decoking operation means the coke combustion activity that occurs inside the radiant tube(s) in the ethylene cracking furnace firebox. Coke combustion activities during decoking can also occur in other downstream equipment such as the process gas outlet piping and transfer line exchangers or quench points.

Ethylene process vent means a gas stream with a flow rate greater than 0.005 standard cubic meters per minute containing greater than 20 parts per million by volume HAP that is continuously discharged during operation of an ethylene production unit. On and after July 6, 2023, ethylene process vent means a gas stream with a flow rate greater than 0.005 standard cubic meters per minute containing greater than 20 parts per million by volume HAP that is continuously or periodically discharged during operation of an ethylene production unit. Ethylene process vents are gas streams that are discharged to the atmosphere (or the point of entry into a control device, if any) either directly or after passing through one or more recovery devices. Ethylene process vents do not include:

(A) Pressure relief device discharges;

(B) Gaseous streams routed to a fuel gas system, including any flares using fuel gas, of which less than 50 percent

of the fuel gas is derived from an ethylene production unit;

(C) Gaseous streams routed to a fuel gas system whereby any flares using fuel gas, of which 50 percent or more of the fuel gas is derived from an ethylene production unit, comply with § 63.1103(e)(4) beginning no later than the compliance dates specified in § 63.1102(c);

(D) Leaks from equipment regulated under this subpart;

(E) Episodic or nonroutine releases such as those associated with startup, shutdown, and malfunction until July 6, 2023;

(F) In situ sampling systems (online analyzers) until July 6, 2023; and

(G) Coke combustion emissions from decoking operations beginning no later than the compliance dates specified in § 63.1102(c).

* * * * *

Force majeure event means a release of HAP, either directly to the atmosphere from a pressure relief device or discharged via a flare, that is demonstrated to the satisfaction of the Administrator to result from an event beyond the owner or operator's control, such as natural disasters; acts of war or terrorism; loss of a utility external to the ethylene production unit (*e.g.,* external power curtailment), excluding power curtailment due to an interruptible service agreement; and fire or explosion originating at a near or adjoining facility outside of the ethylene production unit that impacts the ethylene production unit's ability to operate.

* * * * *

Periodically discharged means gas stream discharges that are intermittent for which the total organic HAP concentration is greater than 20 parts per million by volume and total volatile organic compound emissions are 50 pounds per day or more. These intermittent discharges are associated with routine operations, maintenance activities, startups, shutdowns, malfunctions, or process upsets and do not include pressure relief device discharges or discharges classified as maintenance vents.

Pressure-assisted multi-point flare means a flare system consisting of multiple flare burners in staged arrays whereby the vent stream pressure is used to promote mixing and smokeless operation at the flare burner tips. Pressure-assisted multi-point flares are designed for smokeless operation at velocities up to Mach = 1 conditions (*i.e.,* sonic conditions), can be elevated or at ground level, and typically use cross-lighting for flame propagation to combust any flare vent gases sent to a particular stage of flare burners.

Pressure relief device means a valve, rupture disk, or similar device used only to release an unplanned, nonroutine discharge of gas from process equipment in order to avoid safety hazards or equipment damage. A pressure relief device discharge can result from an operator error, a malfunction such as a power failure or equipment failure, or other unexpected cause. Such devices include conventional, spring-actuated relief valves, balanced bellows relief valves, pilot-operated relief valves, rupture disks, and breaking, buckling, or shearing pin devices. Devices that are actuated either by a pressure of less than or equal to 2.5 pounds per square inch gauge or by a vacuum are not pressure relief devices.

Radiant tube(s) means any portion of the tube coil assembly located within the ethylene cracking furnace firebox whereby a thermal cracking reaction of hydrocarbons (in the presence of steam) occurs. Hydrocarbons and steam pass through the radiant tube(s) of the ethylene cracking furnace during normal operation and coke is removed from the inside of the radiant tube(s) during decoking operation.

Relief valve means a type of pressure relief device that is designed to re-close after the pressure relief.

* * * * *

(3) *Requirements.* The owner or operator must control organic HAP emissions from each affected source emission point by meeting the applicable requirements specified in Table 7 to this section. An owner or operator must perform the applicability assessment procedures and methods for process vents specified in § 63.1104, except for paragraphs (d), (g), (h) through (j), (l)(1), and (n). An owner or operator must perform the applicability assessment procedures and methods for equipment leaks specified in § 63.1107. General compliance, recordkeeping, and reporting requirements are specified in § § 63.1108 through 63.1112. Before July 6, 2023, minimization of emissions from startup, shutdown, and malfunctions must be addressed in the startup, shutdown, and malfunction plan required by § 63.1111; the plan must also establish reporting and recordkeeping of such events. A startup, shutdown, and malfunction plan is not required on and after July 6, 2023 and the requirements specified in § 63.1111 no longer apply; however, for historical compliance purposes, a copy of the plan must be retained and available on-site for five years after July 6, 2023. Except as specified in paragraph (e)(4)(i) of this section, procedures for approval of alternate means of emission limitations are specified in § 63.1113.

(4) *Flares.* Beginning no later than the compliance dates specified in § 63.1102(c), if a steam-assisted, air-assisted, non-assisted, or pressure-assisted multi-point flare is used as a control device for an emission point subject to the requirements in Table 7 to this section, then the owner or operator must meet the applicable requirements for flares as specified in §§ 63.670 and 63.671 of subpart CC, including the provisions in Tables 12 and 13 to subpart CC of this part, except as specified in paragraphs (e)(4)(i) through (xiv) of this section. This requirement also applies to any flare using fuel gas from a fuel gas system, of which 50 percent or more of the fuel gas is derived from an ethylene production unit, being used to control an emission point subject to the requirements in Table 7 of this section. For purposes of compliance with this paragraph, the following terms are defined in § 63.641 of subpart CC: Assist air, assist steam, center steam, combustion zone, combustion zone gas, flare, flare purge gas, flare supplemental gas, flare sweep gas, flare vent gas, lower steam, net heating value, perimeter assist air, pilot gas, premix assist air, total steam, and upper steam.

(i) The owner or operator may elect to comply with the alternative means of emissions limitation requirements specified in of § 63.670(r) of subpart CC in lieu of the requirements in § 63.670(d) through (f) of subpart CC, as applicable. However, instead of complying with § 63.670(r)(3) of subpart CC, the owner or operator must submit the alternative means of emissions limitation request following the requirements in § 63.1113.

(ii) Instead of complying with § 63.670(o)(2)(i) of subpart CC, the owner or operator must develop and implement the flare management plan no later than the compliance dates specified in § 63.1102(c).

(iii) Instead of complying with § 63.670(o)(2)(iii) of subpart CC, if required to develop a flare management plan and submit it to the Administrator, then the owner or operator must also submit all versions of the plan in portable document format (PDF) to the EPA via the Compliance and Emissions Data Reporting Interface (CEDRI), which can be accessed through the EPA's Central Data Exchange (CDX) (*https://cdx.epa.gov/*). If you claim some of the information in your flare management plan is confidential business information (CBI), submit a version with the CBI omitted via CEDRI. A complete plan, including information claimed to

be CBI and clearly marked as CBI, must be mailed to the following address: U.S. Environmental Protection Agency, Office of Air Quality Planning and Standards, Sector Policies and Programs Division, U.S. EPA Mailroom (E143–01), Attention: Ethylene Production Sector Lead, 109 T.W. Alexander Drive, Research Triangle Park, NC 27711.

(iv) Section 63.670(o)(3)(ii) of subpart CC and all references to § 63.670(o)(3)(ii) of subpart CC do not apply. Instead, the owner or operator must comply with the maximum flare tip velocity operating limit at all times.

(v) Substitute ''ethylene production unit'' for each occurrence of ''petroleum refinery.''

(vi) Each occurrence of ''refinery'' does not apply.

(vii) Except as specified in paragraph (e)(4)(vii)(G) of this section, if a pressure-assisted multi-point flare is used as a control device for an emission point subject to the requirements in Table 7 to this section, then the owner or operator must comply with the requirements specified in paragraphs (e)(4)(vii)(A) through (F) of this section.

(A) The owner or operator is not required to comply with the flare tip velocity requirements in § 63.670(d) and (k) of subpart CC;

(B) The owner or operator must substitute ''800'' for each occurrence of ''270'' in § 63.670(e) of subpart CC;

(C) The owner or operator must determine the 15-minute block average NHVvg using only the direct calculation method specified in § 63.670(l)(5)(ii) of subpart CC;

(D) Instead of complying with § 63.670(b) and (g) of subpart CC, if a pressure-assisted multi-point flare uses cross-lighting on a stage of burners rather than having an individual pilot flame on each burner, the owner or operator must operate each stage of the pressure-assisted multi-point flare with a flame present at all times when regulated material is routed to that stage of burners. Each stage of burners that cross-lights in the pressure-assisted multi-point flare must have at least two pilots with at least one continuously lit and capable of igniting all regulated material that is routed to that stage of burners. Each 15-minute block during which there is at least one minute where no pilot flame is present on a stage of burners when regulated material is routed to that stage is a deviation of the standard. Deviations in different 15-minute blocks from the same event are considered separate deviations. The pilot flame(s) on each stage of burners that use cross-lighting must be continuously monitored by a thermocouple or any other equivalent device used to detect the presence of a flame;

(E) Unless the owner or operator of a pressure-assisted multi-point flare chooses to conduct a cross-light performance demonstration as specified in this paragraph, the owner or operator must ensure that if a stage of burners on the flare uses cross-lighting, that the distance between any two burners in series on that stage is no more than 6 feet when measured from the center of one burner to the next burner. A distance greater than 6 feet between any two burners in series may be used provided the owner or operator conducts a performance demonstration that confirms the pressure-assisted multi-point flare will cross-light a minimum of three burners and the spacing between the burners and location of the pilot flame must be representative of the projected installation. The compliance demonstration must be approved by the permitting authority and a copy of this approval must be maintained onsite. The compliance demonstration report must include: A protocol describing the test methodology used, associated test method QA/QC parameters, the waste gas composition and NHVcz of the gas tested, the velocity of the waste gas tested, the pressure-assisted multi-point flare burner tip pressure, the time, length, and duration of the test, records of whether a successful cross-light was observed over all of the burners and the length of time it took for the burners to cross-light, records of maintaining a stable flame after a successful cross-light and the duration for which this was observed, records of any smoking events during the cross-light, waste gas temperature, meteorological conditions (*e.g.,* ambient temperature, barometric pressure, wind speed and direction, and relative humidity), and whether there were any observed flare flameouts; and

(F) The owner or operator of a pressure-assisted multi-point flare must install and operate pressure monitor(s) on the main flare header, as well as a valve position indicator monitoring system for each staging valve to ensure that the flare operates within the proper range of conditions as specified by the manufacturer. The pressure monitor must meet the requirements in Table 13 to subpart CC of this part.

(G) If a pressure-assisted multi-point flare is operating under the requirements of an approved alternative means of emission limitations, the owner or operator shall either continue to comply with the terms of the alternative means of emission limitations or comply with the provisions in paragraphs (e)(4)(vii)(A) through (F) of this section.

(viii) If an owner or operator chooses to determine compositional analysis for net heating value with a continuous process mass spectrometer, the owner or operator must comply with the requirements specified in paragraphs (e)(4)(viii)(A) through (G) of this section.

(A) The owner or operator must meet the requirements in § 63.671(e)(2). The owner or operator may augment the minimum list of calibration gas components found in § 63.671(e)(2) with compounds found during a pre-survey or known to be in the gas through process knowledge.

(B) Calibration gas cylinders must be certified to an accuracy of 2 percent and traceable to National Institute of Standards and Technology (NIST) standards.

(C) For unknown gas components that have similar analytical mass fragments to calibration compounds, the owner or operator may report the unknowns as an increase in the overlapped calibration gas compound. For unknown compounds that produce mass fragments that do not overlap calibration compounds, the owner or operator may use the response factor for the nearest molecular weight hydrocarbon in the calibration mix to quantify the unknown component's NHV_{vg}.

(D) The owner or operator may use the response factor for n-pentane to quantify any unknown components detected with a higher molecular weight than n-pentane.

(E) The owner or operator must perform an initial calibration to identify mass fragment overlap and response factors for the target compounds.

(F) The owner or operator must meet applicable requirements in Performance Specification 9 of 40 CFR part 60, appendix B, for continuous monitoring system acceptance including, but not limited to, performing an initial multi-point calibration check at three concentrations following the procedure in Section 10.1 and performing the periodic calibration requirements listed for gas chromatographs in Table 13 to subpart CC of this part, for the process mass spectrometer. The owner or operator may use the alternative sampling line temperature allowed under Net Heating Value by Gas Chromatograph in Table 13 to subpart CC of this part.

(G) The average instrument calibration error (CE) for each calibration compound at any calibration concentration must not differ by more than 10 percent from the certified cylinder gas value. The CE for each

component in the calibration blend must be calculated using the following equation:

$$CE = \frac{C_m - C_a}{C_a} x\ 100$$

Where:

C_m = Average instrument response (ppm)
C_a = Certified cylinder gas value (ppm)

(ix) An owner or operator using a gas chromatograph or mass spectrometer for compositional analysis for net heating value may choose to use the CE of $NHV_{measured}$ versus the cylinder tag value NHV as the measure of agreement for daily calibration and quarterly audits in lieu of determining the compound-specific CE. The CE for NHV at any calibration level must not differ by more than 10 percent from the certified cylinder gas value. The CE for must be calculated using the following equation:

$$CE = \frac{NHV_{measured} - NHV_a}{NHV_a} x\ 100$$

Where:

$NHV_{measured}$ = Average instrument response (Btu/scf)
NHV_a = Certified cylinder gas value (Btu/scf)

(x) Instead of complying with § 63.670(p) of subpart CC, the owner or operator must keep the flare monitoring records specified in § 63.1109(e).

(xi) Instead of complying with § 63.670(q) of subpart CC, the owner or operator must comply with the reporting requirements specified in § 63.1110(d) and (e)(4).

(xii) When determining compliance with the pilot flame requirements specified in § 63.670(b) and (g), substitute ''pilot flame or flare flame'' for each occurrence of ''pilot flame.''

(xiii) When determining compliance with the flare tip velocity and combustion zone operating limits specified in § 63.670(d) and (e), the requirement effectively applies starting with the 15-minute block that includes a full 15 minutes of the flaring event. The owner or operator is required to demonstrate compliance with the velocity and NHVcz requirements starting with the block that contains the fifteenth minute of a flaring event. The owner or operator is not required to demonstrate compliance for the previous 15-minute block in which the event started and contained only a fraction of flow.

(xiv) In lieu of meeting the requirements in §§ 63.670 and 63.671 of subpart CC, an owner or operator may submit a request to the Administrator for approval of an alternative test method in accordance with § 63.7(f). The alternative test method must be able to demonstrate on an ongoing basis at least once every 15-minutes that the flare meets 96.5% combustion efficiency and provide a description of the alternative recordkeeping and reporting that would be associated with the alternative test method. The alternative test method request may also include a request to use the alternative test method in lieu of the pilot or flare flame monitoring requirements of 63.670(g).

(5) *Maintenance vents.* Unless an extension is requested in accordance with the provisions in § 63.6(i) of subpart A, beginning no later than the compliance dates specified in § 63.1102(c), an owner or operator may designate an ethylene process vent as a maintenance vent if the vent is only used as a result of startup, shutdown, maintenance, or inspection of equipment where equipment is emptied, depressurized, degassed, or placed into service. The owner or operator must comply with the applicable requirements in paragraphs (e)(5)(i) through (iii) of this section for each maintenance vent.

(i) Prior to venting to the atmosphere, remove process liquids from the equipment as much as practical and depressurize the equipment to either: A flare meeting the requirements specified in paragraph (e)(4) of this section, or a non-flare control device meeting the requirements specified in § 63.982(c)(2) of subpart SS, until one of the following conditions, as applicable, is met.

(A) The vapor in the equipment served by the maintenance vent has a lower explosive limit (LEL) of less than 10 percent.

(B) If there is no ability to measure the LEL of the vapor in the equipment based on the design of the equipment, the pressure in the equipment served by the maintenance vent is reduced to 5 pounds per square inch gauge (psig) or less. Upon opening the maintenance vent, active purging of the equipment cannot be used until the LEL of the vapors in the maintenance vent (or inside the equipment if the maintenance is a hatch or similar type of opening) is less than 10 percent.

(C) The equipment served by the maintenance vent contains less than 50 pounds of total volatile organic compounds (VOC).

(D) If, after applying best practices to isolate and purge equipment served by a maintenance vent, none of the applicable criterion in paragraphs (e)(5)(i)(A) through (C) of this section can be met prior to installing or removing a blind flange or similar equipment blind, then the pressure in the equipment served by the maintenance vent must be reduced to 2 psig or less before installing or removing the equipment blind. During installation or removal of the equipment blind, active purging of the equipment may be used provided the equipment pressure at the location where purge gas is introduced remains at 2 psig or less.

(ii) Except for maintenance vents complying with the alternative in paragraph (e)(5)(i)(C) of this section, the owner or operator must determine the LEL or, if applicable, equipment pressure using process instrumentation or portable measurement devices and follow procedures for calibration and maintenance according to manufacturer's specifications.

(iii) For maintenance vents complying with the alternative in paragraph (e)(5)(i)(C) of this section, the owner or operator must determine mass of VOC in the equipment served by the maintenance vent based on the equipment size and contents after considering any contents drained or purged from the equipment. Equipment size may be determined from equipment design specifications. Equipment contents may be determined using process knowledge.

(6) *Bypass lines.* Beginning on the compliance dates specified in § 63.1102(c), the use of a bypass line at any time on a closed vent system to divert emissions subject to the requirements in Table 7 to § 63.1103(e) to the atmosphere or to a control device not meeting the requirements specified in Table 7 of this subpart is an emissions standards violation. If the owner or operator is subject to the bypass monitoring requirements of § 63.983(a)(3) of subpart SS, then the owner or operator must continue to comply with the requirements in § 63.983(a)(3) of subpart SS and the recordkeeping and reporting requirements in §§ 63.998(d)(1)(ii) and 63.999(c)(2) of subpart SS, in addition to paragraph (e)(9) of this section, the

recordkeeping requirements specified in § 63.1109(g), and the reporting requirements specified in § 63.1110(e)(6). For purposes of compliance with this paragraph, the phrase ''Except for equipment needed for safety purposes such as pressure relief devices, low leg drains, high point bleeds, analyzer vents, and open-ended valves or lines'' in § 63.983(a)(3) does not apply; instead, the exemptions specified in paragraph (e)(6)(i) and (ii) of this section apply.

(i) Except for pressure relief devices subject to 40 CFR 63.1107(h)(4), equipment such as low leg drains and equipment subject to the requirements specified in paragraph (f) of Table 7 to § 63.1103(e) are not subject to this paragraph (e)(6) of this section.

(ii) Open-ended valves or lines that use a cap, blind flange, plug, or second valve and follow the requirements specified in § 60.482–6(a)(2), (b), and (c) or follow requirements codified in another regulation that are the same as § 60.482–6(a)(2), (b), and (c) are not subject to this paragraph (e)(6) of this section.

(7) *Decoking operation standards for ethylene cracking furnaces.* Beginning no later than the compliance dates specified in § 63.1102(c), the owner or operator must comply with paragraph (e)(7)(i) of this section and also use at least two of the control measures specified in paragraphs (e)(7)(ii) through (v) of this section to minimize coke combustion emissions from the decoking of the radiant tube(s) in each ethylene cracking furnace.

(i) During normal operations, conduct daily inspections of the firebox burners and repair all burners that are impinging on the radiant tube(s) as soon as practical, but not later than 1 calendar day after the flame impingement is found. The owner or operator may delay burner repair beyond 1 calendar day using the procedures specified in paragraphs (e)(7)(i)(A) and (B) of this section provided the repair cannot be completed during normal operations, the burner cannot be shutdown without significantly impacting the furnace heat distribution and firing rate, and action is taken to reduce flame impingement as much as possible during continued operation. An inspection may include, but is not limited to: visual inspection of the radiant tube(s) for localized bright spots (this may be confirmed with a temperature gun), use of luminescent powders injected into the burner to illuminate the flame pattern, or identifying continued localized coke build-up that causes short runtimes between decoking cycles. A repair may include, but is not limited to: Taking the burner out of service, replacing the burner, adjusting the alignment of the burner, adjusting burner configuration, making burner air corrections, repairing a malfunction of the fuel liquid removal equipment, or adding insulation around the radiant tube(s).

(A) If a shutdown for repair would cause greater emissions than the potential emissions from delaying repair, repair must be completed following the next planned decoking operation (and before returning the ethylene cracking furnace back to normal operations) or during the next ethylene cracking furnace complete shutdown (when the ethylene cracking furnace firebox is taken completely off-line), whichever is earlier.

(B) If a shutdown for repair would cause lower emissions than the potential emissions from delaying repair, then shutdown of the ethylene cracking furnace must immediately commence and the repair must be completed before returning the ethylene cracking furnace back to normal operations.

(ii) During decoking operations, beginning before the expected end of the air-in decoke time, continuously monitor (or use a gas detection tube or equivalent sample technique every three hours to monitor) the CO_2 concentration in the combined decoke effluent downstream of the last component being decoked for an indication that the coke combustion in the ethylene cracking furnace radiant tube(s) is complete. The owner or operator must immediately initiate procedures to stop the coke combustion once the CO_2 concentration at the outlet consistently reaches a level that indicates combustion of coke is complete and site decoke completion assurance procedures have been concluded.

(iii) During decoking operations, continuously monitor the temperature at the radiant tube(s) outlet when air is being introduced to ensure the coke combustion occurring inside the radiant tube(s) is not so aggressive (*i.e.,* too hot) that it damages either the radiant tube(s) or ethylene cracking furnace isolation valve(s). The owner or operator must immediately initiate procedures to reduce the temperature at the radiant tube(s) outlet once the temperature reaches a level that indicates combustion of coke inside the radiant tube(s) is too aggressive.

(iv) After decoking, but before returning the ethylene cracking furnace back to normal operations, verify that decoke air is no longer being added.

(v) After decoking, but before returning the ethylene cracking furnace back to normal operations and/or during normal operations, inject materials into the steam or feed to reduce coke formation inside the radiant tube(s) during normal operation.

(8) *Ethylene cracking furnace isolation valve inspections.* Beginning no later than the compliance dates specified in § 63.1102(c), the owner or operator must conduct ethylene cracking furnace isolation valve inspections as specified in paragraphs (e)(8)(i) and (ii) of this section.

(i) Prior to decoking operation, inspect the applicable ethylene cracking furnace isolation valve(s) to confirm that the radiant tube(s) being decoked is completely isolated from the ethylene production process so that no emissions generated from decoking operations are sent to the ethylene production process. If poor isolation is identified, then the owner or operator must rectify the isolation issue prior to continuing decoking operations to prevent leaks into the ethylene production process.

(ii) Prior to returning the ethylene cracking furnace to normal operations after a decoking operation, inspect the applicable ethylene cracking furnace isolation valve(s) to confirm that the radiant tube(s) that was decoked is completely isolated from the decoking pot or furnace firebox such that no emissions are sent from the radiant tube(s) to the decoking pot or furnace firebox once the ethylene cracking furnace returns to normal operation. If poor isolation is identified, then the owner or operator must rectify the isolation issue prior to continuing normal operations to prevent product from escaping to the atmosphere through the decoking pot or furnace firebox.

(9) *Startup, shutdown, and malfunction referenced provisions.* Beginning no later than the compliance dates specified in § 63.1102(c), the referenced provisions specified in paragraphs (e)(9)(i) through (xx) of this section do not apply when demonstrating compliance with paragraph (e)(3) of this section.

(i) The second sentence of § 63.181(d)(5)(i) of subpart H.

(ii) The second sentence of § 63.983(a)(5) of subpart SS.

(iii) The phrase ''except during periods of start-up, shutdown and malfunction as specified in the referencing subpart'' in § 63.984(a) of subpart SS.

(iv) The phrase ''except during periods of start-up, shutdown and malfunction as specified in the referencing subpart'' in § 63.985(a) of subpart SS.

(v) The phrase ''other than start-ups, shutdowns, or malfunctions'' in § 63.994(c)(1)(ii)(D) of subpart SS.

(vi) Section 63.996(c)(2)(ii) of subpart SS.

(vii) The last sentence of § 63.997(e)(1)(i) of subpart SS.

(viii) Section 63.998(b)(2)(iii) of subpart SS.

(ix) The phrase ''other than periods of startups, shutdowns, and malfunctions'' from § 63.998(b)(5)(i)(A) of subpart SS.

(x) The phrase ''other than a start-up, shutdown, or malfunction'' from § 63.998(b)(5)(i)(B)(3) of subpart SS.

(xi) The phrase ''other than periods of startups, shutdowns, and malfunctions'' from § 63.998(b)(5)(i)(C) of subpart SS.

(xii) The phrase ''other than a start-up, shutdown, or malfunction'' from § 63.998(b)(5)(ii)(C) of subpart SS.

(xiii) The phrase ''except as provided in paragraphs (b)(6)(i)(A) and (B) of this section'' from § 63.998(b)(6)(i) of subpart SS.

(xiv) The second sentence of § 63.998(b)(6)(ii) of subpart SS.

(xv) Section 63.998(c)(1)(ii)(D) through (G) of subpart SS.

(xvi) Section 63.998(d)(3) of subpart SS.

(xvii) The phrase ''may be included as part of the startup, shutdown, and malfunction plan, as required by the referencing subpart for the source, or'' from § 63.1024(f)(4)(i) of subpart UU.

(xviii) The phrase ''(except periods of startup, shutdown, or malfunction)'' from § 63.1026(e)(1)(ii)(A) of subpart UU.

(xix) The phrase ''(except periods of startup, shutdown, or malfunction)'' from § 63.1028(e)(1)(i)(A) of subpart UU.

(xx) The phrase ''(except periods of startup, shutdown, or malfunction)'' from § 63.1031(b)(1) of subpart UU.

(10) *Storage vessel degassing.* Beginning no later than the compliance dates specified in § 63.1102(c), for each storage vessel subject to paragraph (b) or (c) of Table 7 to § 63.1103(e), the owner or operator must comply with paragraphs (e)(10)(i) through (iii) of this section during storage vessel shutdown operations (*i.e.,* emptying and degassing of a storage vessel) until the vapor space concentration in the storage vessel is less than 10 percent of the LEL. The owner or operator must determine the LEL using process instrumentation or portable measurement devices and follow procedures for calibration and maintenance according to manufacturer's specifications.

(i) Remove liquids from the storage vessel as much as practicable;

(ii) Comply with one of the following:

(A) Reduce emissions of total organic HAP by 98 weight-percent by venting emissions through a closed vent system to a flare and meet the requirements of § 63.983 and paragraphs (e)(4) and (9) of this section.

(B) Reduce emissions of total organic HAP by 98 weight-percent by venting emissions through a closed vent system to any combination of non-flare control devices and meet the requirements specified in § 63.982(c)(1) and paragraph (e)(9) of this section.

(C) Reduce emissions of total organic HAP by 98 weight-percent by routing emissions to a fuel gas system or process and meet the requirements specified in § 63.982(d) and paragraph (e)(9) of this section.

(iii) Maintain records necessary to demonstrate compliance with the requirements in § 63.1108(a)(4)(ii) including, if appropriate, records of existing standard site procedures used to empty and degas (deinventory) equipment for safety purposes.

TABLE 7 TO § 63.1103(E)—WHAT ARE MY REQUIREMENTS IF I OWN OR OPERATE AN ETHYLENE PRODUCTION EXISTING OR NEW AFFECTED SOURCE?

If you own or operate . . .	And if . . .	Then you must . . .
(a) A storage vessel (as defined in § 63.1101) that stores liquid containing organic HAP.	(1) The maximum true vapor pressure of total organic HAP is ≥3.4 kilopascals but <76.6 kilopascals; and the capacity of the vessel is ≥4 cubic meters but <95 cubic meters.	(i) Fill the vessel through a submerged pipe; or (ii) Comply with the requirements for storage vessels with capacities ≥95 cubic meters.
(b) A storage vessel (as defined in § 63.1101) that stores liquid containing organic HAP.	(1) The maximum true vapor pressure of total organic HAP is ≥3.4 kilopascals but <76.6 kilopascals; and the capacity of the vessel is ≥95 cubic meters.	(i) Except as specified in paragraph (b)(1)(iii) of this table, comply with the requirements of subpart WW of this part; or (ii) Except as specified in paragraph (b)(1)(iii) of this table, reduce emissions of total organic HAP by 98 weight-percent by venting emissions through a closed vent system to any combination of control devices and meet the requirements of § 63.982(a)(1). (iii) Beginning no later than the compliance dates specified in § 63.1102(c), comply with paragraph (b)(1)(iii)(A), (B), (C), or (D) of this table, and (e)(10) of this section. (A) Comply with the requirements of subpart WW of this part; or (B) Reduce emissions of total organic HAP by 98 weight-percent by venting emissions through a closed vent system to a flare and meet the requirements of § 63.983 and paragraphs (e)(4) and (9) of this section; or (C) Reduce emissions of total organic HAP by 98 weight-percent by venting emissions through a closed vent system to any combination of non-flare control devices and meet the requirements specified in § 63.982(c)(1) and (e)(9) of this section; or (D) Reduce emissions of total organic HAP by 98 weight-percent by routing emissions to a fuel gas system[(a)] or process and meet the requirements specified in § 63.982(d) and (e)(9) of this section.

TABLE 7 TO § 63.1103(E)—WHAT ARE MY REQUIREMENTS IF I OWN OR OPERATE AN ETHYLENE PRODUCTION EXISTING OR NEW AFFECTED SOURCE?—Continued

If you own or operate . . .	And if . . .	Then you must . . .
(c) A storage vessel (as defined in § 63.1101) that stores liquid containing organic HAP.	(1) The maximum true vapor pressure of total organic HAP is ≥76.6 kilopascals.	(i) Except as specified in paragraph (c)(1)(ii) of this table, reduce emissions of total organic HAP by 98 weight-percent by venting emissions through a closed vent system to any combination of control devices and meet the requirements of § 63.982(a)(1). (ii) Beginning no later than the compliance dates specified in § 63.1102(c), comply with paragraph (c)(1)(ii)(A), (B), or (C) of this table, and (e)(10) of this section. (A) Reduce emissions of total organic HAP by 98 weight-percent by venting emissions through a closed vent system to a flare and meet the requirements of § 63.983 and paragraphs (e)(4) and (9) of this section; or (B) Reduce emissions of total organic HAP by 98 weight-percent by venting emissions through a closed vent system to any combination of non-flare control devices and meet the requirements specified in § 63.982(c)(1) and (e)(9) of this section; or (C) Reduce emissions of total organic HAP by 98 weight-percent by routing emissions to a fuel gas system[a] or process and meet the requirements specified in § 63.982(d) and (e)(9) of this section.
(d) An ethylene process vent (as defined in paragraph (e)(2) of this section).	(1) The process vent is at an existing source and the vent stream has a flow rate ≥0.011 scmm and a total organic HAP concentration ≥50 parts per million by volume on a dry basis; or the process vent is at a new source and the vent stream has a flow rate ≥0.008 scmm and a total organic HAP concentration ≥30 parts per million by volume on a dry basis.	(i) Except as specified in paragraph (d)(1)(ii) of this table, reduce emissions of organic HAP by 98 weight-percent; or reduce organic HAP or TOC to a concentration of 20 parts per million by volume on a dry basis corrected to 3% oxygen; whichever is less stringent, by venting emissions through a closed vent system to any combination of control devices and meet the requirements specified in § 63.982(b) and (c)(2). (ii) Beginning no later than the compliance dates specified in § 63.1102(c), comply with the maintenance vent requirements specified in paragraph (e)(5) of this section and either paragraph (d)(1)(ii)(A) or (B) of this table. (A) Reduce emissions of organic HAP by 98 weight-percent; or reduce organic HAP or TOC to a concentration of 20 parts per million by volume on a dry basis corrected to 3-percent oxygen; whichever is less stringent, by venting emissions through a closed vent system to a flare and meet the requirements of § 63.983 and paragraphs (e)(4) and (9) of this section; or (B) Reduce emissions of organic HAP by 98 weight-percent; or reduce organic HAP or TOC to a concentration of 20 parts per million by volume on a dry basis corrected to 3-percent oxygen; whichever is less stringent, by venting emissions through a closed vent system to any combination of non-flare control devices and meet the requirements specified in § 63.982(c)(2) and (e)(9) of this section.
(e) A transfer rack (as defined in paragraph (e)(2) of this section).	(1) Materials loaded have a true vapor pressure of total organic HAP ≥3.4 kilopascals and ≥76 cubic meters per day (averaged over any consecutive 30-day period) of HAP-containing material is loaded.	(i) Reduce emissions of organic HAP by 98 weight-percent; or reduce organic HAP or TOC to a concentration of 20 parts per million by volume on a dry basis corrected to 3-percent oxygen; whichever is less stringent, by venting emissions through a closed vent system to any combination of control devices as specified in § 63.1105 and meet the requirements specified in paragraph (e)(9) of this section.; or

TABLE 7 TO § 63.1103(E)—WHAT ARE MY REQUIREMENTS IF I OWN OR OPERATE AN ETHYLENE PRODUCTION EXISTING OR NEW AFFECTED SOURCE?—Continued

If you own or operate . . .	And if . . .	Then you must . . .
		(ii) Install process piping designed to collect the HAP-containing vapors displaced from tank trucks or railcars during loading and to route it to a process, a fuel gas system, or a vapor balance system, as specified in § 63.1105 and meet the requirements specified in paragraph (e)(9) of this section.[a]
(f) Equipment (as defined in § 63.1101) that contains or contacts organic HAP.	(1) The equipment contains or contacts ≥5 weight-percent organic HAP; and the equipment is not in vacuum service.	(i) Except as specified in paragraph (f)(1)(ii) of this table, comply with the requirements of subpart UU of this part. (ii) Beginning no later than the compliance dates specified in § 63.1102(c), comply with the requirements of paragraph (e)(9) of this section and subpart UU of this part, except instead of complying with the pressure relief device requirements of § 63.1030 of subpart UU, meet the requirements of § 63.1107(h), and in lieu of the flare requirement of § 63.1034(b)(2)(iii), comply with the requirements specified in paragraph (e)(4) of this section.[a]
(g) Processes that generate waste (as defined in paragraph (e)(2) of this section.	(1) The waste stream contains any of the following HAP: Benzene, cumene, ethyl benzene, hexane, naphthalene, styrene, toluene, o-xylene, m-xylene, p-xylene, or 1,3-butadiene.	Comply with the waste requirements of subpart XX of this part. For ethylene production unit waste stream requirements, terms have the meanings specified in subpart XX.
(h) A heat exchange system (as defined in § 63.1082(b)).	.....	Comply with the heat exchange system requirements of subpart XX of this part.
(i) A closed vent system that contains one or more bypass lines.	(1) The bypass line could divert a vent stream directly to the atmosphere or to a control device not meeting the requirements in this table.	Beginning no later than the compliance dates specified in § 63.1102(c), comply with the requirements specified in paragraphs (e)(6) and (9) of this section.
(j) A decoking operation associated with an ethylene cracking furnace.	.....	Beginning no later than the compliance dates specified in § 63.1102(c), comply with the requirements specified in paragraphs (e)(7) and (8) of this section.

[a] Beginning no later than the compliance dates specified in § 63.1102(c), any flare using fuel gas from a fuel gas system, of which 50 percent or more of the fuel gas is derived from an ethylene production unit as determined on an annual average basis, must be in compliance with paragraph (e)(4) of this section.

* * * * *

■ 20. Section 63.1104 is amended by revising paragraph (c) to read as follows:

§ 63.1104 Process vents from continuous unit operations: applicability assessment procedures and methods.

* * * * *

(c) *Applicability assessment requirement.* The TOC or organic HAP concentrations, process vent volumetric flow rates, process vent heating values, process vent TOC or organic HAP emission rates, halogenated process vent determinations, process vent TRE index values, and engineering assessments for process vent control applicability assessment requirements are to be determined during maximum representative operating conditions for the process, except as provided in paragraph (d) of this section, or unless the Administrator specifies or approves alternate operating conditions. For acrylic and modacrylic fiber production affected sources, polycarbonate production affected sources, and ethylene production affected sources, operations during periods of malfunction shall not constitute representative conditions for the purpose of an applicability test. For all other affected sources, operations during periods of startup, shutdown, and malfunction shall not constitute representative conditions for the purpose of an applicability test.

* * * * *

■ 21. Section 63.1105 is amended by revising paragraph (a) introductory text and adding paragraph (a)(5) to read as follows:

§ 63.1105 Transfer racks.

(a) *Design requirements.* Except as specified in paragraph (a)(5) of this section, the owner or operator shall equip each transfer rack with one of the control options listed in paragraphs (a)(1) through (5) of this section.

* * * * *

(5) Beginning no later than the compliance dates specified in § 63.1102(c), if emissions are vented through a closed vent system to a flare at an ethylene production affected source, then the owner or operator must comply with the requirements specified in § 63.1103(e)(4) instead of the requirements in § 63.987 and the provisions regarding flare compliance assessments at § 63.997(a) through (c).

* * * * *

■ 22. Section 63.1107 is amended by revising paragraph (a) and adding paragraph (h) to read as follows:

§ 63.1107 Equipment leaks.

(a) Each piece of equipment within a process unit that can reasonably be expected to contain equipment in organic HAP service is presumed to be in organic HAP service unless an owner or operator demonstrates that the piece of equipment is not in organic HAP service. For a piece of equipment to be considered not in organic HAP service, it must be determined that the percent organic HAP content can be reasonably expected not to exceed the percent by weight control applicability criteria specified in § 63.1103 for an affected source on an annual average basis. For purposes of determining the percent

organic HAP content of the process fluid that is contained in or contacts equipment, Method 18 of 40 CFR part 60, appendix A shall be used. For purposes of determining the percent organic HAP content of the process fluid that is contained in or contacts equipment for the ethylene production affected sources, the following methods shall be used for equipment: For equipment in gas and vapor service, as that term is defined in Subpart UU of this part, shall use Method 18 of 40 CFR part 60, appendix A; for equipment in liquid service, as that term is defined in Subpart UU of this part, shall use a combination of Method 18 of 40 CFR part 60, appendix A, SW–846–8260B (incorporated by reference, see § 63.14); and SW–846–8270D (incorporated by reference, see § 63.14), as appropriate.

* * * * *

(h) *Ethylene production pressure release requirements.* Beginning no later than the compliance dates specified in § 63.1102(c), except as specified in paragraph (h)(4) of this section, owners or operators of ethylene production affected sources must comply with the requirements specified in paragraphs (h)(1) and (2) of this section for pressure relief devices, such as relief valves or rupture disks, in organic HAP gas or vapor service instead of the pressure relief device requirements of § 63.1030 of subpart UU or § 63.165 of subpart H. Beginning no later than the compliance dates specified in § 63.1102(c), except as specified in paragraphs (h)(4) and (5) of this section, the owner or operator must also comply with the requirements specified in paragraphs (h)(3) and (6) through (8) of this section for all pressure relief devices.

(1) *Operating requirements.* Except during a pressure release, operate each pressure relief device in organic HAP gas or vapor service with an instrument reading of less than 500 ppm above background as measured by the method in § 63.1023(b) of subpart UU or § 63.180(b) and (c) of subpart H.

(2) *Pressure release requirements.* For pressure relief devices in organic HAP gas or vapor service, the owner or operator must comply with the applicable requirements in paragraphs (h)(2)(i) through (iii) of this section following a pressure release.

(i) If the pressure relief device does not consist of or include a rupture disk, conduct instrument monitoring, as specified in § 63.1023(b) of subpart UU or § 63.180(b) and (c) of subpart H, no later than 5 calendar days after the pressure relief device returns to organic HAP gas or vapor service following a pressure release to verify that the pressure relief device is operating with an instrument reading of less than 500 ppm.

(ii) If the pressure relief device includes a rupture disk, either comply with the requirements in paragraph (h)(2)(i) of this section (and do not replace the rupture disk) or install a replacement disk as soon as practicable after a pressure release, but no later than 5 calendar days after the pressure release.

(iii) If the pressure relief device consists only of a rupture disk, install a replacement disk as soon as practicable after a pressure release, but no later than 5 calendar days after the pressure release. The owner or operator must not initiate startup of the equipment served by the rupture disk until the rupture disc is replaced.

(3) *Pressure release management.* Except as specified in paragraphs (h)(4) and (5) of this section, the owner or operator must comply with the requirements specified in paragraphs (h)(3)(i) through (v) of this section for all pressure relief devices in organic HAP service.

(i) The owner or operator must equip each affected pressure relief device with a device(s) or use a monitoring system that is capable of:

(A) Identifying the pressure release;

(B) Recording the time and duration of each pressure release; and

(C) Notifying operators immediately that a pressure release is occurring. The device or monitoring system must be either specific to the pressure relief device itself or must be associated with the process system or piping, sufficient to indicate a pressure release to the atmosphere. Examples of these types of devices and systems include, but are not limited to, a rupture disk indicator, magnetic sensor, motion detector on the pressure relief valve stem, flow monitor, or pressure monitor.

(ii) The owner or operator must apply at least three redundant prevention measures to each affected pressure relief device and document these measures. Examples of prevention measures include:

(A) Flow, temperature, liquid level and pressure indicators with deadman switches, monitors, or automatic actuators. Independent, non-duplicative systems within this category count as separate redundant prevention measures.

(B) Documented routine inspection and maintenance programs and/or operator training (maintenance programs and operator training may count as only one redundant prevention measure).

(C) Inherently safer designs or safety instrumentation systems.

(D) Deluge systems.

(E) Staged relief system where the initial pressure relief device (with lower set release pressure) discharges to a flare or other closed vent system and control device.

(iii) If any affected pressure relief device releases to atmosphere as a result of a pressure release event, the owner or operator must perform root cause analysis and corrective action analysis according to the requirement in paragraph (h)(6) of this section and implement corrective actions according to the requirements in paragraph (h)(7) of this section. The owner or operator must also calculate the quantity of organic HAP released during each pressure release event and report this quantity as required in § 63.1110(e)(8)(iii). Calculations may be based on data from the pressure relief device monitoring alone or in combination with process parameter monitoring data and process knowledge.

(iv) The owner or operator must determine the total number of release events that occurred during the calendar year for each affected pressure relief device separately. The owner or operator must also determine the total number of release events for each pressure relief device for which the root cause analysis concluded that the root cause was a force majeure event, as defined in § 63.1103(e)(2).

(v) Except for pressure relief devices described in paragraphs (h)(4) and (5) of this section, the following release events from an affected pressure relief device are a violation of the pressure release management work practice standards.

(A) Any release event for which the root cause of the event was determined to be operator error or poor maintenance.

(B) A second release event not including force majeure events from a single pressure relief device in a 3-calendar year period for the same root cause for the same equipment.

(C) A third release event not including force majeure events from a single pressure relief device in a 3-calendar year period for any reason.

(4) *Pressure relief devices routed to a control device, process, fuel gas system, or drain system.* (i) If all releases and potential leaks from a pressure relief device are routed through a closed vent system to a control device, back into the process, a fuel gas system, or drain system, then the owner or operator is not required to comply with paragraph (h)(1), (2), or (3) of this section.

(ii) Before the compliance dates specified in § 63.1102(c), both the

closed vent system and control device (if applicable) referenced in paragraph (h)(4)(i) of this section must meet the applicable requirements specified in § 63.982(b) and (c)(2). Beginning no later than the compliance dates specified in § 63.1102(c), both the closed vent system and control device (if applicable) referenced in paragraph (h)(4)(i) of this section must meet the applicable requirements specified in §§ 63.982(c)(2), 63.983, and 63.1103(e)(4). For purposes of compliance with this paragraph, the phrase ''Except for equipment needed for safety purposes such as pressure relief devices'' in § 63.983(a)(3) does not apply.

(iii) The drain system (if applicable) referenced in paragraph (h)(4)(i) of this section must meet the applicable requirements specified in § 61.346 or § 63.136.

(5) *Pressure relief devices exempted from pressure release management requirements.* The following types of pressure relief devices are not subject to the pressure release management requirements in paragraph (h)(3) of this section.

(i) Pressure relief devices in heavy liquid service, as defined in § 63.1020 of subpart UU.

(ii) Thermal expansion relief valves.

(iii) Pressure relief devices on mobile equipment.

(iv) Pilot-operated pressure relief devices where the primary release valve is routed through a closed vent system to a control device or back into the process, a fuel gas system, or drain system.

(v) Balanced bellows pressure relief devices where the primary release valve is routed through a closed vent system to a control device or back into the process, a fuel gas system, or drain system.

(6) *Root cause analysis and corrective action analysis.* A root cause analysis and corrective action analysis must be completed as soon as possible, but no later than 45 days after a release event. Special circumstances affecting the number of root cause analyses and/or corrective action analyses are provided in paragraphs (h)(6)(i) through (iv) of this section.

(i) You may conduct a single root cause analysis and corrective action analysis for a single emergency event that causes two or more pressure relief devices that are installed on the same equipment to release.

(ii) You may conduct a single root cause analysis and corrective action analysis for a single emergency event that causes two or more pressure relief devices to release, regardless of the equipment served, if the root cause is reasonably expected to be a *force majeure* event, as defined in § 63.1103(e)(2).

(iii) Except as provided in paragraphs (h)(6)(i) and (ii) of this section, if more than one pressure relief device has a release during the same time period, an initial root cause analysis must be conducted separately for each pressure relief device that had a release. If the initial root cause analysis indicates that the release events have the same root cause(s), the initial separate root cause analyses may be recorded as a single root cause analysis and a single corrective action analysis may be conducted.

(7) *Corrective action implementation.* Each owner or operator required to conduct a root cause analysis and corrective action analysis as specified in paragraphs (h)(3)(iii) and (6) of this section, must implement the corrective action(s) identified in the corrective action analysis in accordance with the applicable requirements in paragraphs (h)(7)(i) through (iii) of this section.

(i) All corrective action(s) must be implemented within 45 days of the event for which the root cause and corrective action analyses were required or as soon thereafter as practicable. If an owner or operator concludes that no corrective action should be implemented, the owner or operator must record and explain the basis for that conclusion no later than 45 days following the event.

(ii) For corrective actions that cannot be fully implemented within 45 days following the event for which the root cause and corrective action analyses were required, the owner or operator must develop an implementation schedule to complete the corrective action(s) as soon as practicable.

(iii) No later than 45 days following the event for which a root cause and corrective action analyses were required, the owner or operator must record the corrective action(s) completed to date, and, for action(s) not already completed, a schedule for implementation, including proposed commencement and completion dates.

(8) *Flowing pilot-operated pressure relief devices.* For ethylene production affected sources that commenced construction or reconstruction on or before October 9, 2019, owners or operators are prohibited from installing a flowing pilot-operated pressure relief device or replacing any pressure relief device with a flowing pilot-operated pressure relief device after July 6, 2023. For ethylene production affected sources that commenced construction or reconstruction after October 9, 2019, owners or operators are prohibited from installing and operating flowing pilot-operated pressure relief devices. For purpose of compliance with this paragraph, a flowing pilot-operated pressure relief device means the type of pilot-operated pressure relief device where the pilot discharge vent continuously releases emissions to the atmosphere when the pressure relief device is actuated.

■ 23. Section 63.1108 is amended by revising paragraphs (a) introductory text, (a)(4), (b)(1)(ii), (b)(2) introductory text, (b)(3), (b)(4)(i) introductory text, and (b)(4)(ii)(B) to read as follows:

§ 63.1108 Compliance with standards and operation and maintenance requirements.

(a) *Requirements.* The requirements of paragraphs (a)(1), (2), and (5) of this section apply to all affected sources except acrylic and modacrylic fiber production affected sources, polycarbonate production affected sources, and beginning no later than the compliance dates specified in § 63.1102(c), ethylene production affected sources. The requirements of paragraph (a)(4) of this section apply only to acrylic and modacrylic fiber production affected sources, polycarbonate production affected sources and beginning no later than the compliance dates specified in § 63.1102(c), ethylene production affected sources. The requirements of paragraphs (a)(3), (6), and (7) of this section apply to all affected sources.

* * * * *

(4)(i) For acrylic and modacrylic fiber production affected sources and polycarbonate production affected sources, and beginning no later than the compliance dates specified in § 63.1102(c), ethylene production affected sources, the emission limitations and established parameter ranges of this part shall apply at all times except during periods of non-operation of the affected source (or specific portion thereof) resulting in cessation of the emissions to which this subpart applies. Equipment leak requirements shall apply at all times except during periods of non-operation of the affected source (or specific portion thereof) in which the lines are drained and depressurized resulting in cessation of the emissions to which the equipment leak requirements apply.

(ii) At all times, the owner or operator must operate and maintain any affected source, including associated air pollution control equipment and monitoring equipment, in a manner consistent with safety and good air pollution control practices for minimizing emissions. The general duty

to minimize emissions does not require the owner or operator to make any further efforts to reduce emissions if levels required by the applicable standard have been achieved. Determination of whether a source is operating in compliance with operation and maintenance requirements will be based on information available to the Administrator that may include, but is not limited to, monitoring results, review of operation and maintenance procedures, review of operation and maintenance records, and inspection of the affected source.

* * * * *

(b) * * *

(1) * * *

(ii) Excused excursions are not allowed for acrylic and modacrylic fiber production affected sources, polycarbonate production affected sources, and beginning no later than the compliance dates specified in § 63.1102(c), ethylene production affected sources. For all other affected sources, including ethylene production affected sources prior to the compliance dates specified in § 63.1102(c), an excused excursion, as described in § 63.998(b)(6)(ii), is not a violation.

(2) *Parameter monitoring: Excursions.* An excursion is not a violation in cases where continuous monitoring is required and the excursion does not count toward the number of excused excursions (as described in § 63.998(b)(6)(ii)), if the conditions of paragraph (b)(2)(i) or (ii) of this section are met, except that the conditions of paragraph (b)(2)(i) of this section do not apply for acrylic and modacrylic fiber production affected sources, polycarbonate production affected sources, and beginning no later than the compliance dates specified in § 63.1102(c), ethylene production affected sources. Nothing in this paragraph shall be construed to allow or excuse a monitoring parameter excursion caused by any activity that violates other applicable provisions of this subpart or a subpart referenced by this subpart.

* * * * *

(3) *Operation and maintenance procedures.* Determination of whether acceptable operation and maintenance procedures are being used will be based on information available to the Administrator. This information may include, but is not limited to, monitoring results, review of operation and maintenance procedures (including the startup, shutdown, and malfunction plan under § 63.1111, if applicable), review of operation and maintenance records, and inspection of the affected source, and alternatives approved as specified in § 63.1113.

(4) * * *

(i) *Applicability assessments.* Unless otherwise specified in a relevant test method required to assess control applicability, each test shall consist of three separate runs using the applicable test method. Each run shall be conducted for the time and under the conditions specified in this subpart. The arithmetic mean of the results of the three runs shall apply when assessing applicability. Upon receiving approval from the Administrator, results of a test run may be replaced with results of an additional test run if it meets the criteria specified in paragraphs (b)(4)(i)(A) through (D) of this section.

* * * * *

(ii) * * *

(B) For acrylic and modacrylic fiber production affected sources, polycarbonate production affected sources, and beginning no later than the compliance dates specified in § 63.1102(c), ethylene production affected sources, performance tests shall be conducted under such conditions as the Administrator specifies to the owner or operator based on representative performance of the affected source for the period being tested. Representative conditions exclude periods of startup and shutdown unless specified by the Administrator or an applicable subpart. The owner or operator may not conduct performance tests during periods of malfunction. The owner or operator must record the process information that is necessary to document operating conditions during the test and include in such record an explanation to support that such conditions represent normal operation. Upon request, the owner or operator shall make available to the Administrator such records as may be necessary to determine the conditions of performance tests.

* * * * *

■ 24. Section 63.1109 is amended by adding paragraphs (e) through (i) to read as follows:

§ 63.1109 Recordkeeping requirements.

* * * * *

(e) *Ethylene production flare records.* For each flare subject to the requirements in § 63.1103(e)(4), owners or operators must keep records specified in paragraphs (e)(1) through (15) of this section in lieu of the information required in § 63.998(a)(1) of subpart SS.

(1) Retain records of the output of the monitoring device used to detect the presence of a pilot flame or flare flame as required in § 63.670(b) of subpart CC and the presence of a pilot flame as required in § 63.1103(e)(4)(vii)(D) for a minimum of 2 years. Retain records of each 15-minute block during which there was at least one minute that no pilot flame or flare flame is present when regulated material is routed to a flare for a minimum of 5 years. For each pressure-assisted multi-point flare that uses cross-lighting, retain records of each 15-minute block during which there was at least one minute that no pilot flame is present on each stage when regulated material is routed to a flare for a minimum of 5 years. You may reduce the collected minute-by-minute data to a 15-minute block basis with an indication of whether there was at least one minute where no pilot flame or flare flame was present.

(2) Retain records of daily visible emissions observations as specified in paragraphs (e)(2)(i) through (iv) of this section, as applicable, for a minimum of 3 years.

(i) To determine when visible emissions observations are required, the record must identify all periods when regulated material is vented to the flare.

(ii) If visible emissions observations are performed using Method 22 of 40 CFR part 60, appendix A–7, then the record must identify whether the visible emissions observation was performed, the results of each observation, total duration of observed visible emissions, and whether it was a 5-minute or 2-hour observation. Record the date and start time of each visible emissions observation.

(iii) If a video surveillance camera is used pursuant to § 63.670(h)(2) of subpart CC, then the record must include all video surveillance images recorded, with time and date stamps.

(iv) For each 2-hour period for which visible emissions are observed for more than 5 minutes in 2 consecutive hours, then the record must include the date and start and end time of the 2-hour period and an estimate of the cumulative number of minutes in the 2-hour period for which emissions were visible.

(3) The 15-minute block average cumulative flows for flare vent gas and, if applicable, total steam, perimeter assist air, and premix assist air specified to be monitored under § 63.670(i) of subpart CC, along with the date and time interval for the 15-minute block. If multiple monitoring locations are used to determine cumulative vent gas flow, total steam, perimeter assist air, and premix assist air, then retain records of the 15-minute block average flows for each monitoring location for a minimum of 2 years, and retain records of the 15-minute block average cumulative flows that are used in subsequent calculations

for a minimum of 5 years. If pressure and temperature monitoring is used, then retain records of the 15-minute block average temperature, pressure, and molecular weight of the flare vent gas or assist gas stream for each measurement location used to determine the 15-minute block average cumulative flows for a minimum of 2 years, and retain records of the 15-minute block average cumulative flows that are used in subsequent calculations for a minimum of 5 years.

(4) The flare vent gas compositions specified to be monitored under § 63.670(j) of subpart CC. Retain records of individual component concentrations from each compositional analysis for a minimum of 2 years. If an NHVvg analyzer is used, retain records of the 15-minute block average values for a minimum of 5 years.

(5) Each 15-minute block average operating parameter calculated following the methods specified in § 63.670(k) through (n) of subpart CC, as applicable.

(6) All periods during which operating values are outside of the applicable operating limits specified in § 63.670(d) through (f) of subpart CC and § 63.1103(e)(4)(vii) when regulated material is being routed to the flare.

(7) All periods during which the owner or operator does not perform flare monitoring according to the procedures in § 63.670(g) through (j) of subpart CC.

(8) For pressure-assisted multi-point flares, if a stage of burners on the flare uses cross-lighting, then a record of any changes made to the distance between burners.

(9) For pressure-assisted multi-point flares, all periods when the pressure monitor(s) on the main flare header show burners are operating outside the range of the manufacturer's specifications. Indicate the date and time for each period, the pressure measurement, the stage(s) and number of burners affected, and the range of manufacturer's specifications.

(10) For pressure-assisted multi-point flares, all periods when the staging valve position indicator monitoring system indicates a stage of the pressure-assisted multi-point flare should not be in operation and when a stage of the pressure-assisted multi-point flare should be in operation and is not. Indicate the date and time for each period, whether the stage was supposed to be open, but was closed or vice versa, and the stage(s) and number of burners affected.

(11) Records of periods when there is flow of vent gas to the flare, but when there is no flow of regulated material to the flare, including the start and stop time and dates of periods of no regulated material flow.

(12) Records when the flow of vent gas exceeds the smokeless capacity of the flare, including start and stop time and dates of the flaring event.

(13) Records of the root cause analysis and corrective action analysis conducted as required in § 63.670(o)(3) of subpart CC and § 63.1103(e)(4)(iv), including an identification of the affected flare, the date and duration of the event, a statement noting whether the event resulted from the same root cause(s) identified in a previous analysis and either a description of the recommended corrective action(s) or an explanation of why corrective action is not necessary under § 63.670(o)(5)(i) of subpart CC.

(14) For any corrective action analysis for which implementation of corrective actions are required in § 63.670(o)(5) of subpart CC, a description of the corrective action(s) completed within the first 45 days following the discharge and, for action(s) not already completed, a schedule for implementation, including proposed commencement and completion dates.

(15) Records described in § 63.10(b)(2)(vi).

(f) *Ethylene production maintenance vent records.* For each maintenance vent opening subject to the requirements in § 63.1103(e)(5), the owner or operator must keep the applicable records specified in (f)(1) through (5) of this section.

(1) The owner or operator must maintain standard site procedures used to deinventory equipment for safety purposes (*e.g.,* hot work or vessel entry procedures) to document the procedures used to meet the requirements in § 63.1103(e)(5). The current copy of the procedures must be retained and available on-site at all times. Previous versions of the standard site procedures, as applicable, must be retained for 5 years.

(2) If complying with the requirements of § 63.1103(e)(5)(i)(A) and the LEL at the time of the vessel opening exceeds 10 percent, records that identify the maintenance vent, the process units or equipment associated with the maintenance vent, the date of maintenance vent opening, and the LEL at the time of the vessel opening.

(3) If complying with the requirements of § 63.1103(e)(5)(i)(B) and either the vessel pressure at the time of the vessel opening exceeds 5 psig or the LEL at the time of the active purging was initiated exceeds 10 percent, records that identify the maintenance vent, the process units or equipment associated with the maintenance vent, the date of maintenance vent opening, the pressure of the vessel or equipment at the time of discharge to the atmosphere and, if applicable, the LEL of the vapors in the equipment when active purging was initiated.

(4) If complying with the requirements of § 63.1103(e)(5)(i)(C), records of the estimating procedures used to determine the total quantity of VOC in equipment and the type and size limits of equipment that contain less than 50 pounds of VOC at the time of maintenance vent opening. For each maintenance vent opening of equipment that contains greater than 50 pounds of VOC for which the deinventory procedures specified in paragraph (f)(1) of this section are not followed or for which the equipment opened exceeds the type and size limits established in the records specified in this paragraph, records that identify the maintenance vent, the process units or equipment associated with the maintenance vent, the date of maintenance vent opening, and records used to estimate the total quantity of VOC in the equipment at the time the maintenance vent was opened to the atmosphere.

(5) If complying with the requirements of § 63.1103(e)(5)(i)(D), identification of the maintenance vent, the process units or equipment associated with the maintenance vent, records documenting actions taken to comply with other applicable alternatives and why utilization of this alternative was required, the date of maintenance vent opening, the equipment pressure and LEL of the vapors in the equipment at the time of discharge, an indication of whether active purging was performed and the pressure of the equipment during the installation or removal of the blind if active purging was used, the duration the maintenance vent was open during the blind installation or removal process, and records used to estimate the total quantity of VOC in the equipment at the time the maintenance vent was opened to the atmosphere for each applicable maintenance vent opening.

(g) *Ethylene production bypass line records.* For each flow event from a bypass line subject to the requirements in § 63.1103(e)(6), the owner or operator must maintain records sufficient to determine whether or not the detected flow included flow requiring control. For each flow event from a bypass line requiring control that is released either directly to the atmosphere or to a control device not meeting the requirements specified in Table 7 to § 63.1103(e), the owner or operator must include an estimate of the volume of

gas, the concentration of organic HAP in the gas and the resulting emissions of organic HAP that bypassed the control device using process knowledge and engineering estimates.

(h) *Decoking operation of ethylene cracking furnace records.* For each decoking operation of an ethylene cracking furnace subject to the standards in § 63.1103(e)(7) and (8), the owner or operator must keep the records specified in paragraphs (h)(1) through (6) of this section.

(1) Records that document the day and time each inspection specified in § 63.1103(e)(7)(i) took place, the results of each inspection, and any repairs made to correct the flame impingement; and for any repair that is delayed beyond 1 calendar day, the records specified in paragraphs (h)(1)(i) through (iii) of this section.

(i) The reason for the delay.

(ii) An estimate of the emissions from shutdown for repair and an estimate of the emissions likely to result from delay of repair, and whether the requirements at § 63.1103(e)(7)(i)(A) or (B) were met.

(iii) The date the repair was completed or, if the repair has not been completed, a schedule for completing the repair.

(2) If the owner or operator chooses to monitor the CO_2 concentration during decoking as specified in § 63.1103(e)(7)(ii), then for each decoking cycle, records must be kept for all measured CO_2 concentration values beginning before the expected end of the air-in decoke time, the criterion used to begin the CO_2 monitoring, and the target used to indicate combustion is complete. The target record should identify any time period the site routinely extends air addition beyond the specified CO_2 concentration and any decoke completion assurance procedures used to confirm all coke has been removed prior to stopping air addition that occurs after the CO_2 target is reached.

(3) If the owner or operator chooses to monitor the temperature at the radiant tube(s) outlet during decoking as specified in § 63.1103(e)(7)(iii), then for each decoking cycle, records must be kept for all measured temperature values and the target used to indicate a reduction in temperature of the inside of the radiant tube(s) is necessary.

(4) If the owner or operator chooses to comply with § 63.1103(e)(7)(iv), then records must be kept that document that decoke air is no longer being added after each decoking cycle.

(5) If the owner or operator chooses to treat steam or feed to reduce coke formation as specified in § 63.1103(e)(7)(v), then records must be kept that document that the planned treatment occurred.

(6) For each decoking operation of an ethylene cracking furnace subject to the requirements in § 63.1103(e)(8), the owner or operator must keep records that document the day each inspection took place and the results of each inspection where an isolation problem was identified including any repairs made to correct the problem.

(i) *Ethylene production pressure relief devices records.* For each pressure relief device subject to the pressure release management work practice standards in § 63.1107(h)(3), the owner or operator must keep the records specified in paragraphs (i)(1) through (3) of this section.

(1) Records of the prevention measures implemented as required in § 63.1107(h)(3)(ii).

(2) Records of the number of releases during each calendar year and the number of those releases for which the root cause was determined to be a force majeure event. Keep these records for the current calendar year and the past five calendar years.

(3) For each release to the atmosphere, the owner or operator must keep the records specified in paragraphs (i)(3)(i) through (iv) of this section.

(i) The start and end time and date of each pressure release to the atmosphere.

(ii) Records of any data, assumptions, and calculations used to estimate of the mass quantity of each organic HAP released during the event.

(iii) Records of the root cause analysis and corrective action analysis conducted as required in § 63.1107(h)(3)(iii), including an identification of the affected pressure relief device, a statement noting whether the event resulted from the same root cause(s) identified in a previous analysis and either a description of the recommended corrective action(s) or an explanation of why corrective action is not necessary under § 63.1107(h)(7)(i).

(iv) For any corrective action analysis for which implementation of corrective actions are required in § 63.1107(h)(7), a description of the corrective action(s) completed within the first 45 days following the discharge and, for action(s) not already completed, a schedule for implementation, including proposed commencement and completion dates.

■ 25. Section 63.1110 is amended by:

■ a. Revising paragraphs (a) introductory text, (a)(7), and (a)(9) introductory text;

■ b. Adding paragraph (a)(10);

■ c. Revising paragraphs (d)(1) introductory text and (d)(1)(i);

■ d. Adding paragraphs (d)(1)(iv) and (v);

■ e. Revising paragraph (e)(1);

■ f. Adding paragraphs (e)(4) through (8); and

■ g. Revising paragraphs (g)(1) and (2).

The revisions and additions read as follows:

§ 63.1110 Reporting requirements.

(a) *Required reports.* Each owner or operator of an affected source subject to this subpart shall submit the reports listed in paragraphs (a)(1) through (8) of this section, as applicable. Each owner or operator of an acrylic and modacrylic fiber production affected source or polycarbonate production affected source subject to this subpart shall also submit the reports listed in paragraph (a)(9) of this section in addition to the reports listed in paragraphs (a)(1) through (8) of this section, as applicable. Beginning no later than the compliance dates specified in § 63.1102(c), each owner or operator of an ethylene production affected source subject to this subpart shall also submit the reports listed in paragraph (a)(10) of this section in addition to the reports listed in paragraphs (a)(1) through (8) of this section, as applicable.

* * * * *

(7) Startup, Shutdown, and Malfunction Reports described in § 63.1111 (except for acrylic and modacrylic fiber production affected sources, ethylene production affected sources, and polycarbonate production affected sources).

* * * * *

(9) Within 60 days after the date of completing each performance test (as defined in § 63.2), the owner or operator must submit the results of the performance tests, including any associated fuel analyses, required by this subpart according to the methods specified in paragraph (a)(9)(i) or (ii) of this section.

* * * * *

(10)(i) Beginning no later than the compliance dates specified in § 63.1102(c), within 60 days after the date of completing each performance test required by this subpart, the owner or operator must submit the results of the performance test following the procedures specified in paragraphs (a)(10)(i)(A) through (C) of this section.

(A) *Data collected using test methods supported by the EPA's Electronic Reporting Tool (ERT) as listed on the EPA's ERT website (https://www.epa.gov/electronic-reporting-air-emissions/electronic-reporting-tool-ert) at the time of the test.* Submit the results of the performance test to the EPA via

CEDRI, which can be accessed through the EPA's CDX (*https://cdx.epa.gov/*). The data must be submitted in a file format generated through the use of the EPA's ERT. Alternatively, you may submit an electronic file consistent with the extensible markup language (XML) schema listed on the EPA's ERT website.

(B) *Data collected using test methods that are not supported by the EPA's ERT as listed on the EPA's ERT website at the time of the test.* The results of the performance test must be included as an attachment in the ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT website. Submit the ERT generated package or alternative file to the EPA via CEDRI.

(C) *CBI.* If you claim some of the information submitted under paragraph (a)(10)(i)(A) or (B) of this section is CBI, then the owner or operator must submit a complete file, including information claimed to be CBI, to the EPA. The file must be generated through the use of the EPA's ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT website. Submit the file on a compact disc, flash drive, or other commonly used electronic storage medium and clearly mark the medium as CBI. Mail the electronic medium to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404–02, 4930 Old Page Rd., Durham, NC 27703. The same file with the CBI omitted must be submitted to the EPA via EPA's CDX as described in paragraphs (a)(10)(i)(A) and (B) of this section.

(ii) Beginning no later than the compliance dates specified in § 63.1102(c), the owner or operator must submit all subsequent Notification of Compliance Status reports required under paragraph (a)(4) of this section in PDF format to the EPA via CEDRI, which can be accessed through EPA's CDX (*https://cdx.epa.gov/*). All subsequent Periodic Reports required under paragraph (a)(5) of this section must be submitted to the EPA via CEDRI using the appropriate electronic report template on the CEDRI website (*https://www.epa.gov/electronic-reporting-air-emissions/compliance-and-emissions-data-reporting-interface-cedri*) for this subpart beginning no later than the compliance dates specified in § 63.1102(c) or once the report template has been available on the CEDRI website for one year, whichever date is later. The date report templates become available will be listed on the CEDRI website. The report must be submitted by the deadline specified in this subpart, regardless of the method in which the report is submitted. If you claim some of the information required to be submitted via CEDRI is CBI, then submit a complete report, including information claimed to be CBI, to the EPA. Periodic Reports must be generated using the appropriate template on the CEDRI website. Submit the file on a compact disc, flash drive, or other commonly used electronic storage medium and clearly mark the medium as CBI. Mail the electronic medium to U.S. Environmental Protection Agency, Office of Air Quality Planning and Standards, Sector Policies and Programs Division, U.S. EPA Mailroom (E143–01), Attention: Ethylene Production Sector Lead, 109 T.W. Alexander Drive, Research Triangle Park, NC 27711. The same file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described earlier in this paragraph.

(iii) If you are required to electronically submit a report through CEDRI in the EPA's CDX, you may assert a claim of EPA system outage for failure to timely comply with the reporting requirement. To assert a claim of EPA system outage, the owner or operator must meet the requirements outlined in paragraphs (a)(10)(iii)(A) through (G) of this section.

(A) The owner or operator must have been or will be precluded from accessing CEDRI and submitting a required report within the time prescribed due to an outage of either the EPA's CEDRI or CDX systems.

(B) The outage must have occurred within the period of time beginning five business days prior to the date that the submission is due.

(C) The outage may be planned or unplanned.

(D) The owner or operator must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or has caused a delay in reporting.

(E) The owner or operator must provide to the Administrator a written description identifying:

(*1*) The date(s) and time(s) when CDX or CEDRI was accessed and the system was unavailable;

(*2*) A rationale for attributing the delay in reporting beyond the regulatory deadline to EPA system outage;

(*3*) Measures taken or to be taken to minimize the delay in reporting; and

(*4*) The date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported.

(F) The decision to accept the claim of EPA system outage and allow an extension to the reporting deadline is solely within the discretion of the Administrator.

(G) In any circumstance, the report must be submitted electronically as soon as possible after the outage is resolved.

(iv) If you are required to electronically submit a report through CEDRI in the EPA's CDX, you may assert a claim of force majeure for failure to timely comply with the reporting requirement. To assert a claim of force majeure, the owner or operator must meet the requirements outlined in paragraphs (a)(10)(iv)(A) through (E) of this section.

(A) You may submit a claim if a *force majeure* event is about to occur, occurs, or has occurred or there are lingering effects from such an event within the period of time beginning five business days prior to the date the submission is due. For the purposes of this paragraph, a *force majeure* event is defined as an event that will be or has been caused by circumstances beyond the control of the affected facility, its contractors, or any entity controlled by the affected facility that prevents you from complying with the requirement to submit a report electronically within the time period prescribed. Examples of such events are acts of nature (*e.g.,* hurricanes, earthquakes, or floods), acts of war or terrorism, or equipment failure or safety hazard beyond the control of the affected facility (*e.g.,* large scale power outage).

(B) The owner or operator must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or has caused a delay in reporting.

(C) The owner or operator must provide to the Administrator:

(*1*) A written description of the force majeure event;

(*2*) A rationale for attributing the delay in reporting beyond the regulatory deadline to the force majeure event;

(*3*) Measures taken or to be taken to minimize the delay in reporting; and

(*4*) The date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported.

(D) The decision to accept the claim of force majeure and allow an extension to the reporting deadline is solely within the discretion of the Administrator.

(E) In any circumstance, the reporting must occur as soon as possible after the force majeure event occurs.

* * * * *

(d) * * *

(1) *Contents.* The owner or operator shall submit a Notification of Compliance Status for each affected source subject to this subpart containing the information specified in paragraphs (d)(1)(i) and (ii) of this section. For pressure relief devices subject to the requirements of § 63.1107(e)(3), the owner or operator of an acrylic and modacrylic fiber production affected source or polycarbonate production affected source shall also submit the information listed in paragraph (d)(1)(iii) of this section in a supplement to the Notification of Compliance Status within 150 days after the first applicable compliance date for pressure relief device monitoring. For flares subject to the requirements of § 63.1103(e)(4), the owner or operator of an ethylene production affected source shall also submit the information listed in paragraph (d)(1)(iv) of this section in a supplement to the Notification of Compliance Status within 150 days after the first applicable compliance date for flare monitoring. For pressure relief devices subject to the pressure release management work practice standards in § 63.1107(h)(3), the owner or operator of an ethylene production affected source shall also submit the information listed in paragraph (d)(1)(v) of this section in a supplement to the Notification of Compliance Status within 150 days after the first applicable compliance date for pressure relief device monitoring.

(i) Except as specified in paragraphs (d)(1)(iv) and (v) of this section, the Notification of Compliance Status shall include the information specified in this subpart and the subparts referenced by this subpart. Alternatively, this information can be submitted as part of a title V permit application or amendment.

* * * * *

(iv) For each flare subject to the requirements in § 63.1103(e)(4), in lieu of the information required in § 63.987(b) of subpart SS, the Notification of Compliance Status shall include flare design (*e.g.,* steam-assisted, air-assisted, non-assisted, or pressure-assisted multi-point); all visible emission readings, heat content determinations, flow rate measurements, and exit velocity determinations made during the initial visible emissions demonstration required by § 63.670(h) of subpart CC, as applicable; and all periods during the compliance determination when the pilot flame or flare flame is absent.

(v) For pressure relief devices subject to the requirements of § 63.1107(h), the Notification of Compliance Status shall include the information specified in paragraphs (d)(1)(v)(A) and (B) of this section.

(A) A description of the monitoring system to be implemented, including the relief devices and process parameters to be monitored, and a description of the alarms or other methods by which operators will be notified of a pressure release.

(B) A description of the prevention measures to be implemented for each affected pressure relief device.

* * * * *

(e) * * *

(1) *Contents.* Except as specified in paragraphs (e)(4) through (8) of this section, Periodic Reports shall include all information specified in this subpart and subparts referenced by this subpart.

* * * * *

(4) *Ethylene production flare reports.* For each flare subject to the requirements in § 63.1103(e)(4), the Periodic Report shall include the items specified in paragraphs (e)(4)(i) through (vi) of this section in lieu of the information required in § 63.999(c)(3) of subpart SS.

(i) Records as specified in § 63.1109(e)(1) for each 15-minute block during which there was at least one minute when regulated material is routed to a flare and no pilot flame or flare flame is present. Include the start and stop time and date of each 15-minute block.

(ii) Visible emission records as specified in § 63.1109(e)(2)(iv) for each period of 2 consecutive hours during which visible emissions exceeded a total of 5 minutes.

(iii) The periods specified in § 63.1109(e)(7). Indicate the date and start time for the period, and the net heating value operating parameter(s) determined following the methods in § 63.670(k) through (n) of subpart CC as applicable.

(iv) For flaring events meeting the criteria in § 63.670(o)(3) of subpart CC and § 63.1103(e)(4)(iv):

(A) The start and stop time and date of the flaring event.

(B) The length of time that emissions were visible from the flare during the event.

(C) Results of the root cause and corrective actions analysis completed during the reporting period, including the corrective actions implemented during the reporting period and, if applicable, the implementation schedule for planned corrective actions to be implemented subsequent to the reporting period.

(v) For pressure-assisted multi-point flares, the periods of time when the pressure monitor(s) on the main flare header show the burners operating outside the range of the manufacturer's specifications.

(vi) For pressure-assisted multi-point flares, the periods of time when the staging valve position indicator monitoring system indicates a stage should not be in operation and is or when a stage should be in operation and is not.

(5) *Ethylene production maintenance vent reports.* For maintenance vents subject to the requirements § 63.1103(e)(5), Periodic Reports must include the information specified in paragraphs (e)(5)(i) through (iv) of this section for any release exceeding the applicable limits in § 63.1103(e)(5)(i). For the purposes of this reporting requirement, owners or operators complying with § 63.1103(e)(5)(i)(D) must report each venting event conducted under those provisions and include an explanation for each event as to why utilization of this alternative was required.

(i) Identification of the maintenance vent and the equipment served by the maintenance vent.

(ii) The date and time the maintenance vent was opened to the atmosphere.

(iii) The LEL, vessel pressure, or mass of VOC in the equipment, as applicable, at the start of atmospheric venting. If the 5 psig vessel pressure option in § 63.1103(e)(5)(i)(B) was used and active purging was initiated while the LEL was 10 percent or greater, also include the LEL of the vapors at the time active purging was initiated.

(iv) An estimate of the mass of organic HAP released during the entire atmospheric venting event.

(6) *Bypass line reports.* For bypass lines subject to the requirements in § 63.1103(e)(6), Periodic Reports must include the date, time, duration, estimate of the volume of gas, the concentration of organic HAP in the gas and the resulting mass emissions of organic HAP that bypass a control device. For periods when the flow indicator is not operating, report the date, time, and duration.

(7) *Decoking operation reports.* For decoking operations of an ethylene cracking furnace subject to the requirements in § 63.1103(e)(7) and (8), Periodic Reports must include the information specified in paragraphs (e)(7)(i) through (iii) of this section.

(i) For each control measure selected to minimize coke combustion emissions as specified in § 63.1103(e)(7)(ii) through (v), report instances where the control measures were not followed.

(ii) Report instances where an isolation valve inspection was not conducted according to the procedures specified in § 63.1103(e)(8).

(iii) For instances where repair was delayed beyond 1 calendar day as specified in § 63.1103(e)(7)(i), report the information specified in § 63.1109(h)(1).

(8) *Ethylene production pressure relief devices reports.* For pressure relief devices subject to the requirements of § 63.1107(h), Periodic Reports must include the information specified in paragraphs (e)(8)(i) through (iii) of this section.

(i) For pressure relief devices in organic HAP gas or vapor service, pursuant to § 63.1107(h)(1), report any instrument reading of 500 ppm or greater.

(ii) For pressure relief devices in organic HAP gas or vapor service subject to § 63.1107(h)(2), report confirmation that any monitoring required to be done during the reporting period to show compliance was conducted.

(iii) For pressure relief devices in organic HAP service subject to § 63.1107(h)(3), report each pressure release to the atmosphere, including duration of the pressure release and estimate of the mass quantity of each organic HAP released; the results of any root cause analysis and corrective action analysis completed during the reporting period, including the corrective actions implemented during the reporting period; and, if applicable, the implementation schedule for planned corrective actions to be implemented subsequent to the reporting period.

* * * * *

(g) * * *

(1) *Submission to the Environmental Protection Agency.* All reports and notifications required under this subpart shall be sent to the appropriate EPA Regional Office and to the delegated State authority, except that request for permission to use an alternative means of emission limitation as provided for in § 63.1113 shall be submitted to the Director of the EPA Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, MD–10, Research Triangle Park, North Carolina, 27711. The EPA Regional Office may waive the requirement to submit a copy of any reports or notifications at its discretion, except that electronic reporting to CEDRI cannot be waived, and as such, compliance with the provisions of this paragraph does not relieve owners or operators of affected facilities of the requirement to submit electronic reports required in this subpart to the EPA.

(2) *Submission of copies.* If any State requires a notice that contains all the information required in a report or notification listed in this subpart, an owner or operator may send the appropriate EPA Regional Office a copy of the report or notification sent to the State to satisfy the requirements of this subpart for that report or notification, except that performance test reports and performance evaluation reports required under paragraph (a)(10) of this section must be submitted to CEDRI in the format specified in that paragraph.

* * * * *

■ 26. Section 63.1111 is amended by revising paragraphs (a) introductory text, (b) introductory text, and (c) introductory text to read as follows:

§ 63.1111 Startup, shutdown, and malfunction.

(a) *Startup, shutdown, and malfunction plan.* Before July 6, 2023, the requirements of this paragraph (a) apply to all affected sources except for acrylic and modacrylic fiber production affected sources and polycarbonate production affected sources. On and after July 6, 2023, the requirements of this paragraph (a) apply to all affected sources except for acrylic and modacrylic fiber production affected sources, ethylene production affected sources, and polycarbonate production affected sources.

* * * * *

(b) *Startup, shutdown, and malfunction reporting requirements.* Before July 6, 2023, the requirements of this paragraph (b) apply to all affected sources except for acrylic and modacrylic fiber production affected sources and polycarbonate production affected sources. On and after July 6, 2023, the requirements of this paragraph (b) apply to all affected sources except for acrylic and modacrylic fiber production affected sources, ethylene production affected sources, and polycarbonate production affected sources.

* * * * *

(c) *Malfunction recordkeeping and reporting.* Before July 6, 2023, the requirements of this paragraph (c) apply only to acrylic and modacrylic fiber production affected sources and polycarbonate production affected sources. On and after July 6, 2023, the requirements of this paragraph (c) apply only to acrylic and modacrylic fiber production affected sources, ethylene production affected sources, and polycarbonate production affected sources.

* * * * *

■ 27. Section 63.1112 is amended by revising paragraph (d)(2) to read as follows:

§ 63.1112 Extension of compliance, and performance test, monitoring, recordkeeping and reporting waivers and alternatives.

* * * * *

(d) * * *

(2) Recordkeeping or reporting requirements may be waived upon written application to the Administrator if, in the Administrator's judgment, the affected source is achieving the relevant standard(s), or the source is operating under an extension of compliance, or the owner or operator has requested an extension of compliance and the Administrator is still considering that request. Electronic reporting to the EPA cannot be waived, and as such, compliance with the provisions of this paragraph does not relieve owners or operators of affected facilities of the requirement to submit electronic reports required in this subpart to the EPA.

* * * * *

■ 28. Section 63.1113 is amended by revising paragraph (a)(2) to read as follows:

§ 63.1113 Procedures for approval of alternative means of emission limitation.

(a) * * *

(2) Any such notice shall be published only after public notice and an opportunity for public comment.

* * * * *

■ 29. Section 63.1114 is amended by revising paragraph (b) introductory text and adding paragraph (b)(6) to read as follows:

§ 63.1114 Implementation and enforcement.

* * * * *

(b) In delegating implementation and enforcement authority of this subpart to a state, local, or tribal agency under subpart E to this part, the authorities contained in paragraphs (b)(1) through (6) of this section are retained by the EPA Administrator and are not transferred to the State, local, or tribal agency.

* * * * *

(6) Approval of an alternative to any electronic reporting to EPA required by this subpart.

RIN 2060–AT31

Fuels Regulatory Streamlining

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action updates many of EPA's existing gasoline, diesel, and other fuel quality programs to improve overall compliance assurance and maintain environmental performance, while reducing compliance costs for industry and EPA. EPA is streamlining existing fuel quality regulations by removing expired provisions, eliminating redundant compliance provisions (*e.g.,* duplicative registration requirements that are required by every EPA fuels program), removing unnecessary and out-of-date requirements, and replacing them with a single set of provisions and definitions that applies to all gasoline, diesel, and other fuel quality programs. This action does not change the stringency of the existing fuel quality standards.

DATES: This rule is effective on January 1, 2021, except for amendatory instructions 48, 51, and 52, which are effective on December 4, 2020, and amendatory instructions 16, 18, and 19, which are effective on January 1, 2022. The incorporation by reference of certain publications listed in this regulation is approved by the Director of the Federal Register as of December 4, 2020. The incorporation by reference of ASTM D86–12, D93–13, D445–12, D613–13, D4052–11, and D5186–03 (R2009) in part 1065 was approved by the Director of the Federal Register as of June 27, 2014.

ADDRESSES: EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2018–0227. All documents in the docket are listed on the *https://www.regulations.gov* website. Although listed in the index, some information is not publicly available, *e.g.,* CBI or other information whose disclosure is restricted by statute. Certain other material is not available on the internet and will be publicly available only in hard copy form. Publicly available docket materials are available electronically through *https://www.regulations.gov.*

FOR FURTHER INFORMATION CONTACT: Nick Parsons, Office of Transportation and Air Quality, Assessment and Standards Division, Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; telephone number: 734–214–4479; email address: *parsons.nick@epa.gov.*

SUPPLEMENTARY INFORMATION:

Does this action apply to me?

Entities potentially affected by this final rule are those involved with the production, distribution, and sale of transportation fuels, including gasoline and diesel fuel. Potentially affected categories include:

Category	NAICS [1] code	Examples of potentially affected entities
Industry	211130	Natural gas liquids extraction and fractionation.
Industry	221210	Natural gas production and distribution.
Industry	324110	Petroleum refineries (including importers).
Industry	325110	Butane and pentane manufacturers.
Industry	325193	Ethyl alcohol manufacturing.
Industry	325199	Manufacturers of gasoline additives.
Industry	424710	Petroleum bulk stations and terminals.
Industry	424720	Petroleum and petroleum products wholesalers.
Industry	447110, 447190	Fuel retailers.
Industry	454310	Other fuel dealers.
Industry	486910	Natural gas liquids pipelines, refined petroleum products pipelines.
Industry	493190	Other warehousing and storage—bulk petroleum storage.

[1] North American Industry Classification System (NAICS).

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be affected by this action. This table lists the types of entities that EPA is now aware could potentially be affected by this action. Other types of entities not listed in the table could also be affected. To determine whether your entity would be affected by this action, you should carefully examine the applicability criteria in 40 CFR part 1090. If you have any questions regarding the applicability of this action to a particular entity, consult the person listed in the **FOR FURTHER INFORMATION CONTACT** section.

K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

EPA believes that this action does not have disproportionately high and adverse human health or environmental effects on minority populations, low income populations, and/or indigenous peoples, as specified in Executive Order 12898 (59 FR 7629, February 16, 1994). This action does not affect the level of protection provided to human health or the environment by applicable air quality standards. This action does not relax the control measures on sources regulated by EPA's fuel quality regulations and therefore will not cause emissions increases from these sources.

L. Congressional Review Act (CRA)

This action is subject to the CRA, and EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action is not a ''major rule'' as defined by 5 U.S.C. 804(2).

XVI. Statutory Authority

Statutory authority for this action comes from sections 202, 203–209, 211, 213, 216, and 301 of the Clean Air Act, 42 U.S.C. 7414, 7521, 7522–7525, 7541, 7542, 7543, 7545, 7547, 7550, and 7601 as well as Public Law 109–58. Additional support for the procedural and compliance related aspects of this action comes from sections 114, 208, and 301(a) of the Clean Air Act, 42 U.S.C. 7414, 7521, 7542, and 7601(a).

List of Subjects

40 CFR Parts 60, 63, 1042, and 1043

Administrative practice and procedure, Air pollution control.

40 CFR Part 79

Fuel additives, Gasoline, Motor vehicle pollution, Penalties, Reporting and recordkeeping requirements.

40 CFR Part 80

Environmental protection, Administrative practice and procedure, Air pollution control, Diesel fuel, Fuel additives, Gasoline, Imports, Oil imports, Petroleum, Renewable fuel.

40 CFR Part 1065

Administrative practice and procedure, Air pollution control, Incorporation by reference.

40 CFR Part 1090

Environmental protection, Administrative practice and procedure, Air pollution control, Diesel fuel, Fuel additives, Gasoline, Imports, Incorporation by reference, Oil imports, Petroleum, Renewable fuel.

Dated: October 15, 2020.

Andrew Wheeler,

Administrator.

For the reasons set forth in the preamble, EPA amends 40 CFR parts 60, 63, 79, 80, 1042, 1043, and 1065 and adds 40 CFR part 1090 as follows:

PART 60—STANDARDS OF PERFORMANCE FOR NEW STATIONARY SOURCES

■ 1. The authority citation for part 60 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart IIII—Standards of Performance for Stationary Compression Ignition Internal Combustion Engines

■ 2. Amend § 60.4207 by:

■ a. Removing and reserving paragraph (a);

■ b. In paragraph (b), removing ''40 CFR 80.510(b)'' and adding ''40 CFR 1090.305'' in its place; and

■ c. Revising paragraph (d).

The revision reads as follows:

§ 60.4207 What fuel requirements must I meet if I am an owner or operator of a stationary CI internal combustion engine subject to this subpart?

* * * * *

(d) Beginning June 1, 2012, owners and operators of stationary CI ICE subject to this subpart with a displacement of greater than or equal to 30 liters per cylinder must use diesel fuel that meets a maximum per-gallon sulfur content of 1,000 parts per million (ppm).

* * * * *

Subpart JJJJ—Standards of Performance for Stationary Spark Ignition Internal Combustion Engines

§ 60.4235 [Amended]

■ 3. Amend § 60.4235 by removing ''40 CFR 80.195'' and adding ''40 CFR 1090.205'' in its place.

PART 63—NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

■ 4. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart R—National Emission Standards for Gasoline Distribution Facilities (Bulk Gasoline Terminals and Pipeline Breakout Stations)

■ 5. Amend § 63.421 by revising the definitions for ''Oxygenated gasoline'' and ''Reformulated gasoline'' to read as follows:

§ 63.421 Definitions.

* * * * *

Oxygenated gasoline means the same as defined in 40 CFR 80.2.

* * * * *

Reformulated gasoline means the same as defined in 40 CFR 80.2.

* * * * *

Subpart ZZZZ—National Emissions Standards for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines

§ 63.6604 [Amended]

■ 6. In § 63.6604, amend paragraphs (a), (b), and (c) by removing ''40 CFR 80.510(b)'' and adding ''40 CFR 1090.305'' in its place.

PART 79—REGISTRATION OF FUEL AND FUEL ADDITIVES

■ 7. The authority citation for part 79 continues to read as follows:

Authority: 42 U.S.C. 7414, 7524, 7545, and 7601.

Subpart A—General Provisions

■ 8. Amend § 79.5 by revising paragraph (a)(1) to read as follows:

§ 79.5 Periodic reporting requirements.

(a) * * * (1) For each calendar year (January 1 through December 31) commencing after the date prescribed for any fuel in subpart D of this part, fuel manufacturers must submit to the Administrator a report for each registered fuel showing the range of concentration of each additive reported under § 79.11(a) and the volume of such fuel produced in the year. Reports must be submitted by March 31 for the preceding year, or part thereof, on forms supplied by the Administrator. If the date prescribed for a particular fuel in subpart D of this part, or the later registration of a fuel is between October 1 and December 31, no report will be required for the period to the end of that year.

* * * * *

Subpart C—Additive Registration Procedures

■ 9. Amend § 79.21 by:

■ a. Revising paragraphs (f) and (g); and

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 63

[EPA–HQ–OAR–2002–0083; FRL–10008–45–OAR]

RIN 2060–AT03

National Emission Standards for Hazardous Air Pollutants: Integrated Iron and Steel Manufacturing Facilities Residual Risk and Technology Review

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action finalizes the residual risk and technology review (RTR) conducted for the Integrated Iron and Steel Manufacturing Facilities source category regulated under national emission standards for hazardous air pollutants (NESHAP). The Agency found that risks due to emissions of air toxics from this source category are acceptable and that the current NESHAP provides an ample margin of safety to protect public health. Under the technology review, we found no developments in practices, processes, or control technologies that necessitate revision of the standards. In addition, we are taking final action to establish emission standards for mercury in response to a 2004 administrative petition for reconsideration which minimizes emissions by limiting the amount of mercury per ton of metal scrap used. We also are removing exemptions for periods of startup, shutdown, and malfunction (SSM) consistent with a 2008 court decision, and clarifying that the emissions standards apply at all times; adding electronic reporting of performance test results and compliance reports; and making minor corrections and clarifications for a few other rule provisions.

DATES: This final rule is effective on July 13, 2020. The incorporation by reference (IBR) of certain publications listed in the rule is approved by the Director of the Federal Register as of July 13, 2020.

ADDRESSES: The U.S. Environmental Protection Agency (EPA) has established a docket for this action under Docket ID No. EPA–HQ–OAR–2002–0083. All documents in the docket are listed on the *https://www.regulations.gov/* website. Although listed, some information is not publicly available, *e.g.,* Confidential Business Information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the internet and will be publicly available only in hard copy form. Publicly available docket materials are available electronically through *https://www.regulations.gov/*. Out of an abundance of caution for members of the public and our staff, the EPA Docket Center and Reading Room was closed to public visitors on March 31, 2020, to reduce the risk of transmitting COVID–19. Our Docket Center staff will continue to provide remote customer service via email, phone, and webform. There is a temporary suspension of mail delivery to the EPA, and no hand deliveries are currently accepted. For further information and updates on EPA Docket Center services and the current status, please visit us online at *https://www.epa.gov/dockets.*

FOR FURTHER INFORMATION CONTACT: For questions about this final action, contact Dr. Donna Lee Jones, Sector Policies and Programs Division (D243–02), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–5251; fax number: (919) 541–4991; and email address: *jones.donnalee@epa.gov.* For specific information regarding the risk assessment methodology, contact Ted Palma, Health and Environmental Impacts Division (C539–02), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–5470; fax number: (919) 541–0840; and email address: *palma.ted@epa.gov.* For information about the applicability of the NESHAP to a particular entity, contact Maria Malave, Office of Enforcement and Compliance Assurance, U.S. Environmental Protection Agency, WJC South Building (Mail Code 2227A), 1200 Pennsylvania Avenue NW, Washington DC 20460; telephone number: (202) 564–7027; and email address: *malave.maria@epa.gov.*

SUPPLEMENTARY INFORMATION: *Preamble acronyms and abbreviations.* We use multiple acronyms and terms in this preamble. While this list may not be exhaustive, to ease the reading of this preamble and for reference purposes, the EPA defines the following terms and acronyms here:

ACI activated carbon injection
ADL above detection limit
AISI American Iron and Steel Institute
ANSI American National Standards Institute
ASME American Society of Mechanical Engineers
ASTM American Society for Testing and Materials
BDL below detection limit
BF blast furnace
BOPF basic oxygen process furnace
CAA Clean Air Act
CDX Central Data Exchange
CEDRI Compliance and Emissions Data Reporting Interface
CFR Code of Federal Regulations
COS carbonyl sulfide
DCOT Digital Camera Opacity Technique
DLL detection level limited
EAF electric arc furnace
EPA Environmental Protection Agency
ERT Electronic Reporting Tool
ESP electrostatic precipitators
HAP hazardous air pollutant(s)
HCl hydrochloric acid
HCN hydrogen cyanide
HI hazard index
HMTDS hot metal transfer, desulfurization, and skimming
HQ hazard quotient
IBR incorporation by reference
ICR information collection request
km kilometers
lbs pounds
MACT maximum achievable control technology
MIR maximum individual risk
NAICS North American Industry Classification System
NESHAP national emission standards for hazardous air pollutants
NRDC Natural Resources Defense Council
NVMSRP National Vehicle Mercury Switch Recovery Program
OAQPS Office of Air Quality Planning and Standards
OMB Office of Management and Budget
PDF portable document format
PM particulate matter
$PM_{2.5}$ particulate matter at or below 2.5 micrometers.
ppm parts per million
REL reference exposure level
RFA Regulatory Flexibility Act
RTR residual risk and technology review
SSM startup, shutdown, and malfunction
TOSHI target organ-specific hazard index
tpy tons per year
UFIP unmeasured fugitive and intermittent particulate
UMRA Unfunded Mandates Reform Act
UPL upper prediction limit
U.S. United States
VCS voluntary consensus standards
VOC volatile organic compound

Background information. On August 16, 2019, the EPA proposed the results of the RTR and various amendments for the Integrated Iron and Steel Manufacturing Facilities NESHAP (84 FR 42704). In this action, we are finalizing decisions and revisions for the rule. We summarize some of the more significant comments we timely received regarding the proposed rule and provide our responses in this preamble. A summary of all other public comments on the proposal and the EPA's responses to those comments is available in the *Summary of Public Comments and Responses for the Risk and Technology Review for Integrated Iron and Steel Manufacturing Facilities* (Docket ID No. EPA–HQ–OAR–2002–

0083). A ''redline'' (track changes) version of the regulatory language that incorporates the changes in this action is available in the docket.

Organization of this document. The information in this preamble is organized as follows:

I. General Information
A. Does this action apply to me?
B. Where can I get a copy of this document and other related information?
C. Judicial Review and Administrative Reconsideration
II. Background
A. What is the statutory authority for this action?
B. What is the Integrated Iron and Steel Manufacturing Facilities source category and how does the NESHAP regulate HAP emissions from the source category?
C. What changes did we propose for the Integrated Iron and Steel Manufacturing Facilities source category in our August 16, 2019, proposal?
D. Regulatory Background
III. What is included in this final rule?
A. What are the final rule amendments based on the risk review for the Integrated Iron and Steel Manufacturing Facilities source category?
B. What are the final rule amendments based on the technology review for the Integrated Iron and Steel Manufacturing Facilities source category?
C. What are the final rule amendments for mercury for the Integrated Iron and Steel Manufacturing Facilities source category?
D. What are the final rule amendments addressing emissions during periods of SSM?
E. What are the final rule amendments addressing electronic reporting?
F. What other changes are being made to the NESHAP?
G. What are the effective and compliance dates of the standards?
IV. What is the rationale for our final decisions and amendments for the Integrated Iron and Steel Manufacturing Facilities source category?
A. Residual Risk Review for the Integrated Iron and Steel Manufacturing Facilities Source Category
B. Technology Review for the Integrated Iron and Steel Manufacturing Facilities Source Category
C. Mercury Emission Limits
D. Changes to SSM Provisions
E. Electronic Reporting
F. Other Issues Regarding UFIP Sources of HAP Emissions
G. Other Items
V. Summary of Cost, Environmental, and Economic Impacts and Additional Analyses Conducted
A. What are the affected sources?
B. What are the air quality impacts?
C. What are the cost impacts?
D. What are the economic impacts?
E. What are the benefits?
F. What analysis of environmental justice did we conduct?
VI. Statutory and Executive Order Reviews
A. Executive Orders 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review
B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs
C. Paperwork Reduction Act (PRA)
D. Regulatory Flexibility Act (RFA)
E. Unfunded Mandates Reform Act (UMRA)
F. Executive Order 13132: Federalism
G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks
I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
J. National Technology Transfer and Advancement Act (NTTAA) and 1 CFR part 51
K. Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations
L. Congressional Review Act (CRA)

I. General Information

A. Does this action apply to me?

Regulated entities. Categories and entities potentially regulated by this action are shown in Table 1 of this preamble.

TABLE 1—NESHAP AND INDUSTRIAL SOURCE CATEGORIES AFFECTED BY THIS FINAL ACTION

Source category	NESHAP	NAICS code [1]
Integrated Iron and Steel Manufacturing	40 CFR part 63, subpart FFFFF	331110

[1] North American Industry Classification System.

Table 1 of this preamble is not intended to be exhaustive, but rather to provide a guide for readers regarding entities likely to be affected by the final action for the source category listed. To determine whether your facility is affected, you should examine the applicability criteria in the appropriate NESHAP. If you have any questions regarding the applicability of any aspect of this NESHAP, please contact the appropriate person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section of this preamble.

B. Where can I get a copy of this document and other related information?

In addition to being available in the docket, an electronic copy of this final action will also be available on the internet. Following signature by the EPA Administrator, the EPA will post a copy of this final action at: *https://www.epa.gov/stationary-sources-air-pollution/integrated-iron-and-steel-manufacturing-national-emission-standards.* Following publication in the **Federal Register**, the EPA will post the **Federal Register** version and key technical documents at this same website.

Additional information is available on the RTR website at *https://www.epa.gov/stationary-sources-air-pollution/risk-and-technology-review-national-emissions-standards-hazardous.* This information includes an overview of the RTR program, links to project websites for the RTR source categories.

C. Judicial Review and Administrative Reconsideration

Under Clean Air Act (CAA) section 307(b)(1), judicial review of this final action is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit (the Court) by September 11, 2020. Under CAA section 307(b)(2), the requirements established by this final rule may not be challenged separately in any civil or criminal proceedings brought by the EPA to enforce the requirements.

Section 307(d)(7)(B) of the CAA further provides that only an objection to a rule or procedure which was raised with reasonable specificity during the period for public comment (including any public hearing) may be raised during judicial review. This section also provides a mechanism for the EPA to reconsider the rule if the person raising an objection can demonstrate to the Administrator that it was impracticable to raise such objection within the period for public comment or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule. Any person seeking to make such a demonstration should

submit a Petition for Reconsideration to the Office of the Administrator, U.S. EPA, Room 3000, WJC South Building, 1200 Pennsylvania Ave. NW, Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. EPA, 1200 Pennsylvania Ave. NW, Washington, DC 20460.

II. Background

A. What is the statutory authority for this action?

Section 112 of the CAA establishes a two-stage regulatory process to address emissions of hazardous air pollutants (HAP) from stationary sources. In the first stage, we must identify categories of sources emitting one or more of the HAP listed in CAA section 112(b) and then promulgate technology-based NESHAP for those sources. ''Major sources'' are those that emit, or have the potential to emit, any single HAP at a rate of 10 tons per year (tpy) or more, or 25 tpy or more of any combination of HAP. For major sources, these standards are commonly referred to as maximum achievable control technology (MACT) standards and must reflect the maximum degree of emission reductions of HAP achievable (after considering cost, energy requirements, and non-air quality health and environmental impacts). In developing MACT standards, CAA section 112(d)(2) directs the EPA to consider the application of measures, processes, methods, systems, or techniques, including, but not limited to, those that reduce the volume of or eliminate HAP emissions through process changes, substitution of materials, or other modifications; enclose systems or processes to eliminate emissions; collect, capture, or treat HAP when released from a process, stack, storage, or fugitive emissions point; are design, equipment, work practice, or operational standards; or any combination of the above.

For these MACT standards, the statute specifies certain minimum stringency requirements, which are referred to as MACT floor requirements, and which may not be based on cost considerations. See CAA section 112(d)(3). For new sources, the MACT floor cannot be less stringent than the emission control achieved in practice by the best-controlled similar source. The MACT standards for existing sources can be less stringent than floors for new sources, but they cannot be less stringent than the average emission limitation achieved by the best-performing 12 percent of existing sources in the category or subcategory (or the best-performing five sources for categories or subcategories with fewer than 30 sources). In developing MACT standards, we must also consider control options that are more stringent than the floor under CAA section 112(d)(2). We may establish standards more stringent than the floor, based on the consideration of the cost of achieving the emissions reductions, any non-air quality health and environmental impacts, and energy requirements.

In the second stage of the regulatory process, the CAA requires the EPA to undertake two different analyses, which we refer to as the technology review and the residual risk review. Under the technology review, we must review the technology-based standards and revise them ''as necessary (taking into account developments in practices, processes, and control technologies)'' no less frequently than every 8 years, pursuant to CAA section 112(d)(6). Under the residual risk review, we must evaluate the risk to public health remaining after application of the technology-based standards and revise the standards, if necessary, to provide an ample margin of safety to protect public health or to prevent, taking into consideration costs, energy, safety, and other relevant factors, an adverse environmental effect. The residual risk review is required within 8 years after promulgation of the technology-based standards, pursuant to CAA section 112(f). In conducting the residual risk review, if the EPA determines that the current standards provide an ample margin of safety to protect public health, it is not necessary to revise the MACT standards pursuant to CAA section 112(f).[1] For more information on the statutory authority for this rule, see 84 FR 42704, August 16, 2019.

B. What is the Integrated Iron and Steel Manufacturing Facilities source category and how does the NESHAP regulate HAP emissions from the source category?

The EPA promulgated the Integrated Iron and Steel Manufacturing Facilities NESHAP on May 20, 2003 (68 FR 27646). The standards are codified at 40 Code of Federal Regulations (CFR) part 63, subpart FFFFF. The rule was amended on July 13, 2006 (71 FR 39579). The amendments added a new compliance option, revised emission limitations, reduced the frequency of repeat performance tests for certain emission units, added corrective action requirements, and clarified monitoring, recordkeeping, and reporting requirements. All documents used to develop the previous 2003 and 2006 final rules can be found in either the legacy docket, A–2000–44, or the electronic docket, EPA–HQ–OAR–2002–0083.

The Integrated Iron and Steel Manufacturing Facilities industry consists of facilities that produce steel from iron ore pellets, coke, metal scrap, and other raw materials using furnaces and other processes. The Integrated Iron and Steel Manufacturing Facilities source category includes sinter production, iron preparation, iron production, and steel production. The source category covered by this MACT standard currently includes 11 facilities.

The main sources of air toxics emissions from Integrated Iron and Steel Manufacturing Facilities are the blast furnace (BF); basic oxygen process furnace (BOPF); hot metal transfer, desulfurization, and skimming (HMTDS) operations; ladle metallurgy operations; sinter plant windbox; sinter plant discharge end; and sinter cooler. All 11 facilities have BFs, BOPFs, HMTDS operations, and ladle metallurgy operations. However, only three facilities have sinter plants. See 40 CFR 63.7852 for definitions of the emission units at integrated iron and steel manufacturing facilities.

The NESHAP includes emission limits for particulate matter (PM) and opacity standards (both of which are surrogates for PM HAP) for furnaces and sinter plants. The NESHAP also includes an emission limit for volatile organic compounds (VOC) for the sinter plant windbox exhaust stream or, as an alternative, an operating limit for the oil content of the sinter plant feedstock. The VOC and oil content limits serve as surrogates for all organic HAP emitted from the windbox.

C. What changes did we propose for the Integrated Iron and Steel Manufacturing Facilities source category in our August 16, 2019, proposal?

On August 16, 2019, the EPA published a proposed rule in the **Federal Register** for the Integrated Iron and Steel Manufacturing Facilities NESHAP, 40 CFR part 63, subpart FFFFF, that took into consideration the RTR analyses (84 FR 42704). In the proposed rule, we also proposed a numerical emissions standard for

[1] The Court has affirmed this approach of implementing CAA section 112(f)(2)(A): *NRDC* v. *EPA,* 529 F.3d 1077, 1083 (DC Cir. 2008) (''If EPA determines that the existing technology-based standards provide an 'ample margin of safety,' then the Agency is free to readopt those standards during the residual risk rulemaking.'').

mercury and an alternative compliance option based on limiting the amount of mercury in the metal scrap used by these facilities. In addition, we proposed the removal of exemptions for periods of SSM consistent with a 2008 court decision, and clarifying that the emissions standards apply at all times; the addition of electronic reporting of performance test results and compliance reports; and minor corrections and clarifications for a few other rule provisions.

D. Regulatory Background

In 2003, the EPA promulgated standards pursuant to CAA section 112(d)(2) and (3) for HAP emissions from the Integrated Iron and Steel Manufacturing Facilities source category. In 2004, the Sierra Club submitted an administrative petition for reconsideration on several issues, including adding standards for mercury, dioxins/furans, polycyclic aromatic hydrocarbons, benzene, and other organic HAP. In 2005, the EPA granted reconsideration to evaluate a possible mercury emission limit, but denied the petition for reconsideration to the extent it requested reconsideration of other issues. The Sierra Club sought judicial review of the 2003 NESHAP as well as the EPA's 2005 denial of the petition for reconsideration. In February 2010, the EPA asked the Court for a voluntary remand without vacatur of both the 2003 rule and the EPA's 2005 reconsideration denial letter. The Court granted this request and the rule and the letter denying reconsideration were remanded to the Agency.

III. What is included in this final rule?

This action finalizes the EPA's determinations pursuant to the RTR provisions of CAA section 112 for the Integrated Iron and Steel Manufacturing Facilities source category. This action also finalizes amendments to the NESHAP, including the addition of mercury emission limits, changes to SSM provisions, addition of electronic reporting, and minor corrections and clarifications to a number of other rule provisions. This final action also includes some changes to the August 2019 proposed requirements based on consideration of comments received during the public comment period described in section IV of this preamble.

A. What are the final rule amendments based on the risk review for the Integrated Iron and Steel Manufacturing Facilities source category?

The EPA proposed no changes to the Integrated Iron and Steel Manufacturing Facilities NESHAP based on the risk review conducted pursuant to CAA section 112(f). In this action, we are finalizing our proposed determination that risks from this source category are acceptable, the standards provide an ample margin of safety to protect public health, and more stringent standards are not necessary to prevent an adverse environmental effect. Section IV.A.3 of this preamble provides a summary of key comments we received regarding the risk review and our responses to those comments.

B. What are the final rule amendments based on the technology review for the Integrated Iron and Steel Manufacturing Facilities source category?

Consistent with the proposal, we determined that there are no developments in practices, processes, and control technologies that warrant revisions to the MACT standards for this source category. Therefore, we are not finalizing revisions to the MACT standards pursuant to CAA section 112(d)(6).

C. What are the final rule amendments for mercury for the Integrated Iron and Steel Manufacturing Facilities source category?

The EPA is promulgating emissions standards for mercury for the Integrated Iron and Steel Manufacturing Facilities source category pursuant to CAA sections 112(d)(2) and (3).

We are promulgating a MACT floor limit of 0.00026 pounds (lbs) of mercury per ton of scrap processed as an input-based limit for all existing BOPFs and related units at existing integrated iron and steel facilities pursuant to CAA section 112(d)(3) for existing sources. We are finalizing the mercury emission limit for existing sources as proposed. We are providing two options to demonstrate compliance with the input-based emission limit in the final rule: (1) Subsequent to an initial performance test required within 1 year of the effective date of the rule, conduct performance testing twice per permit cycle, (*i.e.,* mid-term and at initial or end term for permitted facilities, or every 2.5 years for facilities without a permit) at all BOPF-related units and convert the sum of the results to input-based units (*i.e.,* lbs of mercury per ton of scrap input) and document the results in a test report that can be submitted electronically to the delegated authority with the results (see section IV.E below); or (2) certify annually that the facility obtains all of their scrap from National Vehicle Mercury Switch Recovery Program (NVMSRP) participants (or similar program as approved by the delegated authority), or certify that the scrap processed by the facility does not contain mercury switches. Existing sources will have 1 year to comply with the mercury emission limits.

Pursuant to CAA section 112(d)(3), the standard for new sources shall not be less stringent than the emission control that is achieved in practice by the best controlled similar source. We are promulgating a new source MACT limit of 0.000081 lbs of mercury per ton of scrap processed as an input-based limit for any new BOPF and related units, or any new integrated iron and steel facility. With regard to compliance, new sources will have the same options to demonstrate compliance as existing sources. These new source limits apply to BOPFs for which construction or reconstruction commenced after August 16, 2019.

The mercury emission limits, promulgated pursuant to CAA sections 112(d)(2) and (3), have been added to Table 1 in the NESHAP. In addition, 40 CFR 63.7791 (and related sections 40 CFR 63.7820, 63.7821, 63.7825, 63.7826, 63.7833, 63.7840, and 63.7841) describes the specific compliance deadlines and compliance options related to the control of mercury. Based on consideration of public comments discussed in section IV.C below, we made some minor revisions to the proposed deadlines, compliance options, and testing requirements in 40 CFR 63.7791, 63.7820(e), 63.7821(e), 63.7825, 63.7833(h), 63.7833(i), 63.7840(e), 63.7840(f), and 63.7841(b)(9)–(11). The specific revisions are described in section IV.C.5 of this preamble.

D. What are the final rule amendments addressing emissions during periods of SSM?

In this action, we are finalizing revisions to the SSM provisions of the NESHAP to ensure that they are consistent with the Court decision in *Sierra Club* v. *EPA,* 551 F. 3d 1019 (DC Cir. 2008), which vacated two provisions that exempted sources from the requirement to comply with otherwise applicable CAA section 112(d) emission standards during periods of SSM. We also are finalizing various other changes to modify reporting and monitoring as a result of the SSM revisions. Our analyses and changes related to these issues are discussed below. In addition, we are making minor revisions to aspects of the proposed SSM requirements in response to comments. These changes are discussed below in IV.D.5.

We are finalizing the proposed revision of 40 CFR 63.7810(a) to eliminate the SSM exemption. The

revision will apply after January 11, 2021. In addition, we are updating the references in Table 4 (the General Provisions Applicability Table) of 40 CFR part 63, subpart FFFFF, including the references to 40 CFR 63.6(f)(1) and (h)(1)—the provisions vacated by *Sierra Club* v. *EPA.* Consistent with *Sierra Club* v. *EPA,* the standards in this rule will apply at all times. We are also revising 40 CFR part 63, subpart FFFFF, Table 4 to change several references related to requirements that apply during periods of SSM. For example, we are eliminating the incorporation of the General Provisions' requirement that sources develop an SSM plan. We also are eliminating and revising certain recordkeeping and reporting requirements related to the SSM exemption.

The EPA has attempted to ensure that the provisions we eliminated are inappropriate, unnecessary, or redundant in the absence of the SSM exemption. In promulgating the standards in this rule, the EPA has taken into account startup and shutdown periods and, for the reasons explained below, has not proposed alternate standards for those periods. The integrated iron and steel industry has not identified (and there are no data indicating) any specific problems with removing the SSM provisions.

1. 40 CFR 63.7810(d) General Duty

We are promulgating revisions to the General Provisions table (Table 4) of 40 CFR part 63, subpart FFFFF by adding an entry for 40 CFR 63.6(e)(1)(i), which describes the general duty to minimize emissions, and including a ''No'' for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, we include ''Yes on or before January 11, 2021 and No thereafter.'' in column 3. Some of the language in that section is no longer necessary or appropriate in light of the elimination of the SSM exemption. We are instead adding general duty regulatory text at 40 CFR 63.7810(d) that reflects the general duty to minimize emissions while eliminating the reference to periods covered by an SSM exemption. The current language in 40 CFR 63.6(e)(1)(i) characterizes what the general duty entails during periods of SSM. With the elimination of the SSM exemption, there is no need to differentiate between normal operations, startup and shutdown, and malfunction events in describing the general duty. Therefore, the language the EPA is promulgating for 40 CFR 63.7810(d) does not include that language from 40 CFR 63.6(e)(1) after January 11, 2021 for each such source, and after July 13, 2020 for new and reconstructed sources for which construction or reconstruction commenced after August 16, 2019.

We are also finalizing revisions to the General Provisions table (Table 4) of 40 CFR part 63, subpart FFFFF by adding an entry for 40 CFR 63.6(e)(1)(ii) and including ''No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019.'' For all other affected sources, we are adding ''Yes, on or before January 11, 2021 and No thereafter.'' in column 3. 40 CFR 63.6(e)(1)(ii) imposes requirements that are not necessary with the elimination of the SSM exemption or are redundant with the general duty requirement being added at 40 CFR 63.7810(d).

2. SSM Plan

We are finalizing revisions to the General Provisions table (Table 4) of 40 CFR part 63, subpart FFFFF by adding an entry for 40 CFR 63.6(e)(3) and including ''No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes, on or before January 11, 2021 and No thereafter.'' in column 3. Generally, the paragraphs under 40 CFR 63.6(e)(3) require development of an SSM plan and specify SSM recordkeeping and reporting requirements related to the SSM plan. As the EPA is removing the SSM exemptions, the affected units will be subject to an emission standard during such events. The applicability of a standard during such events will ensure that sources have ample incentive to plan for and achieve compliance and, thus, the SSM plan requirements are no longer necessary. For that same reason, we are revising 40 CFR 63.7810(c) to remove the SSM plan requirement 180 days after publication in the **Federal Register** for sources that commenced construction or reconstruction on or before August 16, 2019, and to remove the SSM plan requirement upon publication in the **Federal Register** for all sources that commenced construction or reconstruction after August 16, 2019.

3. Compliance With Standards

We are finalizing revisions to the General Provisions table (Table 4) of 40 CFR part 63, subpart FFFFF by adding an entry for 40 CFR 63.6(f)(1) and including ''No'' in column 3. The exemption at 40 CFR 63.6(f)(1), which exempted sources from non-opacity standards during periods of SSM, was vacated by the Court in *Sierra Club* v. *EPA,* as discussed above.

We also are finalizing revisions to the General Provisions table (Table 4) of 40 CFR part 63, subpart FFFFF by adding an entry for 40 CFR 63.6(h)(1) and including ''No'' in column 3. The exemption at 40 CFR 63.6(h)(1), which exempted sources from opacity standards during periods of SSM, was also vacated by the Court in *Sierra Club* v. *EPA.* Consistent with *Sierra Club* v. *EPA,* the EPA is finalizing revisions to standards in this rule to ensure that a CAA section 112 standard applies at all times.

4. 40 CFR 63.7822 and 63.7823 Performance Testing

We are finalizing revisions to the General Provisions table (Table 4) of 40 CFR part 63, subpart FFFFF by adding an entry for 40 CFR 63.7(e)(1) and including ''No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes, on or before January 11, 2021 and No thereafter.'' in column 3. In section 40 CFR 63.7(e)(1), performance testing requirements are described. The EPA is instead adding a performance testing requirement at 40 CFR 63.7822(a) and 63.7823(a). The performance testing requirements we are adding differ from the General Provisions performance testing provisions in several respects. The regulatory text we are adding does not include the language in 40 CFR 63.7(e)(1) that restated the SSM exemption and precluded SSM periods from being considered ''representative'' for purposes of performance testing. In 40 CFR 63.7(e)(1), performance tests conducted under this subpart should not be conducted during SSM because conditions during SSM are often not representative of normal operating conditions. During SSM periods, both emission and flow rate profiles can be highly variable and unsuitable for the emission measurement methods. The EPA is promulgating language that requires the owner or operator to record the process information that is necessary to document operating conditions during the test and include in this record an explanation to support that such conditions represent normal operation. In 40 CFR 63.7(e), the owner or operator is required to make available to the Administrator on request such records ''as may be necessary to determine the condition of the performance test,'' but does not specifically require the information to be recorded. The regulatory text the EPA is adding to this provision builds onto that requirement and makes explicit the requirement to record the information.

5. Monitoring

We are finalizing revisions to the General Provisions table (Table 4) of 40 CFR part 63, subpart FFFFF by adding entries for 40 CFR 63.8(c)(1)(i) and (iii) and including ''No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes, on or before January 11, 2021 and No thereafter.'' in column 3. The cross-references to the general duty and SSM plan requirements in those subparagraphs are not necessary in light of other requirements of 40 CFR 63.8 that require good air pollution control practices (40 CFR 63.8(c)(1)) and that set out the requirements of a quality control program for monitoring equipment (40 CFR 63.8(d)).

We are finalizing revisions to the General Provisions table (Table 4) of 40 CFR part 63, subpart FFFFF by adding an entry for 40 CFR 63.8(d)(3) and including ''No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes, on or before January 11, 2021 and No thereafter.'' in column 3. The final sentence in 40 CFR 63.8(d)(3) refers to the General Provisions' SSM plan requirement which is no longer applicable. The EPA is adding to the rule at 40 CFR 63.7842(b)(3) text that is identical to 40 CFR 63.8(d)(3) except that the final sentence is replaced with the following sentence: ''The program of corrective action should be included in the plan required under 40 CFR 63.8(d)(2).''

6. 40 CFR 63.7842 Recordkeeping

We are finalizing revisions to the General Provisions table (Table 4) of 40 CFR part 63, subpart FFFFF by adding an entry for 40 CFR 63.10(b)(2)(i) and including ''No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes, on or before January 11, 2021 and No thereafter.'' in column 3. 40 CFR 63.10(b)(2)(i) describes the recordkeeping requirements during startup and shutdown. These recording provisions are no longer necessary because the EPA is requiring that recordkeeping and reporting applicable to normal operations would apply to startup and shutdown. In the absence of special provisions applicable to startup and shutdown, such as a startup and shutdown plan, there is no reason to retain additional recordkeeping for startup and shutdown periods.

We are finalizing revisions to the General Provisions table (Table 4) of 40 CFR part 63, subpart FFFFF by adding an entry for 40 CFR 63.10(b)(2)(ii) and including ''No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes, on or before January 11, 2021 and No thereafter.'' in column 3. 40 CFR 63.10(b)(2)(ii) describes the recordkeeping requirements during a malfunction. The EPA is adding such requirements to 40 CFR 63.7842. The regulatory text we are adding differs from the General Provisions it is replacing in that the General Provisions requires the creation and retention of a record of the occurrence and duration of each malfunction of process, air pollution control, and monitoring equipment. The EPA is finalizing this requirement to apply to any failure to meet an applicable standard and is requiring the source to record the date, time, and duration of the failure rather than the ''occurrence.'' The EPA is also adding to 40 CFR 63.7842(a)(3) a requirement that sources keep records that include a list of the affected sources or equipment and actions taken to minimize emissions, an estimate of the quantity of each regulated pollutant emitted over the standard for which the source failed to meet the standard, and a description of the method used to estimate the emissions. Examples of such methods would include product-loss calculations, mass balance calculations, measurements when available, or engineering judgment based on known process parameters. The EPA is requiring that sources keep records of this information to ensure that there is adequate information to allow the EPA to determine the severity of any failure to meet a standard, and to provide data that may document how the source met the general duty to minimize emissions when the source has failed to meet an applicable standard.

We are finalizing revisions to the General Provisions table (Table 4) of 40 CFR part 63, subpart FFFFF by adding an entry for 40 CFR 63.10(b)(2)(iv) and including ''No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes, on or before January 11, 2021 and No thereafter.'' in column 3. When applicable, the provision requires sources to record actions taken during SSM events when actions were inconsistent with their SSM plan. The requirement is no longer appropriate because SSM plans would no longer be required. The requirement previously applicable under 40 CFR 63.10(b)(2)(iv) to record actions to minimize emissions and record corrective actions during SSM is now applicable at all times by 40 CFR 63.7842(a)(4).

We are finalizing revisions to the General Provisions table (Table 4) of 40 CFR part 63, subpart FFFFF by adding an entry for 40 CFR 63.10(b)(2)(v) and including ''No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes, on or before January 11, 2021 and No thereafter.'' in column 3. When applicable, the provision requires sources to record actions taken during SSM events to show that actions taken were consistent with their SSM plan. The requirement is no longer appropriate because SSM plans would no longer be required.

We are finalizing revisions to the General Provisions table (Table 4) of 40 CFR part 63, subpart FFFFF by adding an entry for 40 CFR 63.10(c)(15) and including ''No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes, on or before January 11, 2021 and No thereafter.'' in column 3. Because the SSM plan requirement is being eliminated, 40 CFR 63.10(c)(15) no longer applies. When applicable, the provision allowed an owner or operator to use the affected source's SSM plan or records kept to satisfy the recordkeeping requirements of the SSM plan, specified in 40 CFR 63.6(e), to also satisfy the requirements of 40 CFR 63.10(c)(10) through (12). The EPA is eliminating this requirement because SSM plans would no longer be required, and, therefore, 40 CFR 63.10(c)(15) no longer serves any useful purpose for affected units.

7. 40 CFR 63.7841 Reporting

We are finalizing revisions to the General Provisions table (Table 4) of 40 CFR part 63, subpart FFFFF by adding an entry for 40 CFR 63.10(d)(5)(i) and including ''No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes, on or before January 11, 2021 and No thereafter.'' in column 3. 40 CFR 63.10(d)(5)(i) describes the reporting requirements for startups, shutdowns, and malfunctions. To replace the General Provisions reporting requirement, the EPA is adding reporting requirements to 40 CFR 63.7841(b)(4). The replacement language differs from the General Provisions requirement in that it eliminates

periodic SSM reports as a stand-alone report. We are adding language that requires sources that fail to meet an applicable standard at any time to report the information concerning such events in the semiannual reporting period compliance report already required under this rule. We are requiring the report to contain the date, time, duration, and the cause of such events (including unknown cause, if applicable), a list of the affected source or equipment, an estimate of the quantity of each regulated pollutant emitted over any emission limit, and a description of the method used to estimate the emissions. Examples of such methods would include product-loss calculations, mass balance calculations, measurements when available, or engineering judgment based on known process parameters. The EPA is promulgating this requirement to ensure that there is adequate information to determine compliance, to allow the EPA to determine the severity of the failure to meet an applicable standard, and to provide data that may document how the source met the general duty to minimize emissions during a failure to meet an applicable standard.

We are no longer requiring owners or operators to determine whether actions taken to correct a malfunction are consistent with an SSM plan, because plans are no longer required. These final amendments, therefore, eliminate from this section the cross-reference to 40 CFR 63.10(d)(5)(i) that contains the description of the previously required SSM report format and submittal schedule. These specifications are no longer necessary because the SSM events would be reported in otherwise required periodic reports with similar format and submittal requirements.

We are finalizing revisions to the General Provisions table (Table 4) of 40 CFR part 63, subpart FFFFF by adding an entry for 40 CFR 63.10(d)(5)(ii) and including ''No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes, on or before January 11, 2021 and No thereafter.'' in column 3. 40 CFR 63.10(d)(5)(ii) describes an immediate report for startups, shutdown, and malfunctions when a source failed to meet an applicable standard but did not follow the SSM plan. We are no longer requiring owners and operators to report when actions taken during an SSM event were not consistent with an SSM plan, because such plans are no longer required.

E. What are the final rule amendments addressing electronic reporting?

Through this final rule, the EPA is requiring that owners and operators of integrated iron and steel manufacturing facilities submit the required electronic copies of performance test results and semiannual reports through the EPA's Central Data Exchange (CDX) using the Compliance and Emissions Data Reporting Interface (CEDRI). A description of the electronic data submission process is provided in the memorandum titled *Electronic Reporting Requirements for New Source Performance Standards (NSPS) and National Emission Standards for Hazardous Air Pollutants (NESHAP) Rules* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0909).

This final rule requires that performance test results collected using test methods that are supported by the EPA's Electronic Reporting Tool (ERT), as listed on the ERT website at the time of the test, be submitted in the format generated through the use of the ERT, and that other performance test results be submitted in portable document format (PDF) using the attachment module of the ERT. Similarly, performance evaluation results of continuous monitoring systems that measure relative accuracy test audit pollutants that are supported by the ERT at the time of the test, should be submitted in the format generated through the use of the ERT; other performance evaluation results should be submitted in PDF using the attachment module of the ERT. For semiannual compliance reports, the final rule requires that owners and operators use the appropriate spreadsheet template to submit information to CEDRI. The draft template for these reports is included in the docket for this rulemaking and the final template will be available on the CEDRI homepage (*https://www.epa.gov/electronic-reporting-air-emissions/cedri*).

Additionally, the EPA has identified two broad circumstances in which electronic reporting extensions may be provided. In both circumstances, the decision to accept the claim of needing additional time to report is within the discretion of the Administrator, and reporting should occur as soon as possible. The EPA is providing these potential extensions to protect owners and operators from noncompliance in cases where they cannot successfully submit a report by the reporting deadline for reasons outside of their control. The situation where an extension may be warranted due to outages of the EPA's CDX or CEDRI which precludes an owner or operator from accessing the system and submitting required reports is addressed in 40 CFR 63.7841(e). The situation where an extension may be warranted due to a force majeure event, which is defined as an event that would be or has been caused by circumstances beyond the control of the affected facility, its contractors, or any entity controlled by the affected facility that prevents an owner or operator from complying with the requirement to submit a report electronically as required by this rule is addressed in 40 CFR 63.7841(f). Examples of such events are acts of nature, acts of war or terrorism, or equipment failure or safety hazards beyond the control of the facility.

The electronic submittal of the reports addressed in this rulemaking will increase the usefulness of the data contained in those reports, is in keeping with current trends in data availability and transparency, will further assist in the protection of public health and the environment, will improve compliance by facilitating the ability of regulated facilities to demonstrate compliance with requirements, and by facilitating the ability of delegated state, local, tribal, and territorial air agencies and the EPA to assess and determine compliance, and will ultimately reduce burden on regulated facilities, delegated air agencies, and the EPA. Electronic reporting also eliminates paper-based, manual processes, thereby saving time and resources, simplifying data entry, eliminating redundancies, minimizing data reporting errors, and providing data quickly and accurately to the affected facilities, air agencies, the EPA, and the public. Moreover, electronic reporting is consistent with the EPA's plan to implement Executive Order 13563 and is in keeping with the EPA's Agency-wide policy developed in response to the White House's Digital Government Strategy. For more information on the benefits of electronic reporting, see the memorandum titled *Electronic Reporting Requirements for New Source Performance Standards (NSPS) and National Emission Standards for Hazardous Air Pollutants (NESHAP) Rules* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0909).

We are also making minor revisions to aspects of the proposed electronic reporting requirements in response to comments. These rule changes are discussed in section IV.E.5 of this preamble.

F. What other changes are being made to the NESHAP?

1. IBR Under 1 CFR Part 51

We are promulgating regulatory text that includes IBR. In accordance with requirements of 1 CFR 51.5, the EPA is incorporating by reference the three documents listed below and amending 40 CFR 63.14 to identify the provisions for which these documents are IBR approved for this rule:

- ANSI/ASME PTC 19.10–1981, Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus], issued August 31, 1981, IBR approved for 40 CFR 63.7822(b), 63.7824(e) and 63.7825(b). This method determines quantitatively the gaseous constituents of exhausts resulting from stationary combustion sources. The gases addressed in the method are oxygen, carbon dioxide, carbon monoxide, nitrogen, sulfur dioxide, sulfur trioxide, nitric oxide, nitrogen dioxide, hydrogen sulfide, and hydrocarbons. The method is approved for this rule for oxygen and carbon dioxide measurements, with the caveats described in section VI.J of this preamble.
- ASTM D7520–16, Standard Test Method for Determining the Opacity of a Plume in the Outdoor Ambient Atmosphere, approved April 1, 2016, IBR approved for 40 CFR 63.7823(c), 63.7823(d), 63.7823(e), and 63.7833(g). This method describes procedures to determine the opacity of a plume, using digital imagery and associated hardware and software, where opacity is caused by PM emitted from a stationary point source in the outdoor ambient environment. The opacity of emissions is determined by the application of a digital camera opacity technique (DCOT) that consists of a digital still camera, analysis software, and the output function's content to obtain and interpret digital images to determine and report plume opacity. The method is approved for this rule with caveats described in section VI.J of this preamble.
- Fabric Filter Bag Leak Detection Guidance, EPA–454/R–98–015, Office of Air Quality Planning and Standards (OAQPS), September 1997, IBR approved for 40 CFR 63.7831(f). This document provides guidance on the use of triboelectric monitors as fabric filter bag leak detectors. The document includes fabric filter and monitoring system descriptions; guidance on monitor selection, installation, setup, adjustment, and operation; and quality assurance procedures.

2. Technical and Editorial Rule Corrections and Clarifications

In this final rule, the EPA is making a number of technical and editorial changes to the NESHAP to reflect corrections and clarifications. These revisions are described in section IV.G.3 of this preamble.

G. What are the effective and compliance dates of the standards?

This final rule is effective on July 13, 2020. Because most of these amendments provide corrections and clarifications to the current rule and do not impose new requirements on the industry, existing sources are required to comply with the amendments 180 days after publication of the final rule, except where indicated otherwise, as in the provisions for mercury. Sources constructed on or before August 16, 2019 must comply with the mercury emission limits within 1 year of publication of the final rule. New BOPF or new facilities constructed or reconstructed after August 16, 2019, must comply with the new source mercury emission limit on the effective date of the final rule, or upon startup, whichever is later. Electronic reporting for the compliance report is required beginning either 180 days after promulgation of the final rule or 180 days after the spreadsheet template is available in CEDRI, whichever is later. Electronic reporting of performance tests is required upon promulgation of the final rule.

IV. What is the rationale for our final decisions and amendments for the Integrated Iron and Steel Manufacturing Facilities source category?

For each significant issue, this section provides a description of what we proposed and what we are finalizing for each issue, the EPA's rationale for the final decisions and amendments, a summary of key comments and responses, and impact on final rule language, if applicable. For all comments not discussed in this preamble, comment summaries and the EPA's responses can be found in the *Summary of Public Comments and Responses for the Risk and Technology Review for Integrated Iron and Steel Manufacturing Facilities* document, which is available in the docket.

A. Residual Risk Review for the Integrated Iron and Steel Manufacturing Facilities Source Category

1. What did we propose pursuant to CAA section 112(f) for the Integrated Iron and Steel Manufacturing Facilities source category?

On August 16, 2019 (84 FR 42704), the EPA proposed that risks posed by emissions from the source category are acceptable, that the current NESHAP provides an ample margin of safety to protect public health, and that additional standards are not necessary to prevent an adverse environmental effect. The estimated cancer risks were below the presumptive limit of acceptability and the noncancer risk results indicate there is minimal likelihood of adverse noncancer health effects due to HAP emissions from this source category. The proposed decision on ample margin of safety was based on weighing factors relevant to this particular source category, including the risk posed by point sources and the costs and cost-effectiveness of additional controls to reduce risk further, as well as uncertainties in the assessment of unmeasured fugitive and intermittent particulate (UFIP),[2] including uncertainties in the baseline emissions estimates used in estimating risk posed by UFIP emissions, the costs and effectiveness of the work practices we considered to reduce these emissions, and the amount of risk reduction that could be achieved with the work practices.

The EPA sets standards under CAA section 112(f)(2) using ''a two-step standard-setting approach, with an analytical first step to determine an 'acceptable risk' that considers all health information, including risk estimation uncertainty, and includes a presumptive limit on maximum individual risk (MIR) of approximately 1-in-10 thousand.'' (54 FR 38045, September 14, 1989). In the proposal, the EPA estimated risks based on actual and allowable emissions from integrated iron and steel sources, and we considered these in determining acceptability. A more thorough discussion of the risk assessment is included in the *Residual Risk Assessment for the Integrated Iron and Steel Manufacturing Source Category in Support of the Risk and Technology Review 2020 Final Rule* document, available in the docket for this rule

[2] The UFIP sources are BF bleeder valve unplanned openings (also known as slips), BF bleeder valve planned openings, BF bell leaks, BF casthouse fugitives, BF iron beaching, BF slag handling and storage operations, and BOPF shop fugitives.

(Docket ID No. EPA–HQ–OAR–2002–0083).

In the proposed rule, as presented in Table 2 below, based on modeling point source actual emissions from the source category for all 11 facilities, we estimated inhalation cancer risk to the individual most exposed was 10-in-1 million. The estimated incidence of cancer due to inhalation exposures due to the point sources for the source category was 0.03 excess cancer cases per year, or one excess case every 33 years. We estimated that approximately 64,000 people face an increased cancer risk greater than or equal to 1-in-1 million due to inhalation exposure to HAP emissions from the point sources for this source category. The Agency estimated that the maximum chronic noncancer target organ-specific hazard index (TOSHI) from inhalation exposure due to point sources for this source category was 0.1. In the screening assessment of worst-case acute inhalation impacts due to point sources, we estimated a maximum hazard quotient (HQ) of 0.3 (due to arsenic) based on the reference exposure level (REL). With regard to multipathway human health risks, we estimated the cancer risk for the highest exposed individual to be 40-in-1 million (due to dioxins/furans emissions from sinter plants) and the maximum chronic noncancer hazard quotient (HQ) to be less than 1 for all the persistent and bioaccumulative HAP. Based on the results of the environmental risk screening analysis, we do not expect an adverse environmental effect as a result of HAP emissions from point source emissions from this source category.

As shown in Table 2, based on allowable emissions, the estimated inhalation cancer risk to the individual most exposed from point sources in the source category is 70-in-1 million and the estimated incidence of cancer due to inhalation exposures to these allowable emissions is 0.3 excess cancer cases per year, or one excess case every 3 years. An estimated 6 million people would face an increased cancer risk greater than or equal to 1-in-1 million due to inhalation exposure to allowable HAP emissions from this source category. The maximum chronic noncancer TOSHI from inhalation exposure is 0.9 based on allowable emissions.

TABLE 2—RISK SUMMARY FOR THE INTEGRATED IRON AND STEEL MANUFACTURING SOURCE CATEGORY POINT SOURCE EMISSIONS

Emissions	Inhalation cancer risk		Population cancer risk			Max chronic individual noncancer risk		Max acute noncancer risk		Multipathway assessment
	Maximum individual risk (in 1 million)	Risk driver	Cancer incidence (cases per year)	≥10 in 1 million	≥1 in 1 million	Hazard index (TOSHI)	Risk driver	Hazard quotient	Risk driver	Risk driver and health endpoints
Baseline Actual Emissions: Source Category.	10	chromium (VI) compounds.	0.03	60	64,000	0.1 (developmental).	arsenic and lead compounds.	0.7	arsenic compounds.	Cancer (dioxins/furans) site-specific MIR = 40-in-1 million; Noncancer (mercury) site-specific HQ = 0.5
Baseline Allowable Emissions: Source Category.	70	arsenic compounds, chromium (VI) compounds, nickel compounds, cadmium compounds.	0.3	79,500	5,900,000	0.9 (developmental).	arsenic and lead compounds.	.....	.....	

We also estimated risk posed by both point source and nonpoint (*i.e.,* UFIP) emissions from an actual facility in the category that we selected as an example facility. Of the facilities in the category, the example facility has the largest production capacity, the highest estimated HAP emissions from steel-making sources (*i.e.,* facility emissions not including sinter plant emissions), and the highest estimated UFIP emissions. The example facility is also the facility with the highest potential population exposure (4 million people within 50 kilometers of the facility). The EPA conducted a risk assessment using conservative emissions estimates to evaluate the potential exposures and risks due to all the emissions for this one example facility. We performed the risk analysis for the example facility to assess the potential change in the magnitude of risk when risk from UFIP emissions is added to risk posed by point-source emissions. The estimated risks due to actual emissions from nonpoint (*i.e.,* UFIP) and point sources for the example facility are presented in Table 3.

When UFIP sources were included in the EPA's risk analysis, the estimated HAP emissions increased from 3 tpy to 53 tpy and the estimated inhalation cancer risk to the individual most exposed to actual emissions from the example facility increased from 2-in-1 million to 20-in-1 million. The estimated population with risks greater than or equal to 1-in-1 million increased from 3,000 to 4,000,000, and the population with risks greater than or equal to 10-in-1 million increased from 0 to 9,000. The maximum chronic noncancer TOSHI from inhalation exposures remained at less than 1, but the acute HQ increased from 0.3 to 3 based on the REL (for arsenic). The two UFIP sources that are the greatest contributors to the inhalation risk in terms of MIR were the BF casthouse and BOPF shop, which are currently regulated by opacity limits in the rule. Based on allowable emissions, the estimated inhalation cancer risk to the individual most exposed increased from 30-in-1 million to 50-in-1 million with the inclusion of emissions from UFIP sources.

There is considerable uncertainty in the estimated risk due to UFIP sources for the example facility due to the uncertainties in the estimated UFIP emissions and release parameters. Nevertheless, if UFIP emissions were quantified for the entire source category, the source category risks and the number of individuals with cancer risk exceeding 1-in-1 million would be expected to increase for each facility.

Although it is problematic to estimate from our risk assessment results (shown in Tables 2 and 3) what the increase in risk might be for each facility in the entire industry without quantifying UFIP emissions for each facility, based upon results from the example facility, we concluded that it is likely that the cancer MIR based on allowable emissions at all other facilities would be less than 90-in-1 million (70-in-1 million from point sources and up to 20-in-1 million from UFIP emissions) and the maximum chronic noncancer HI would be less than 1. For information on the development of emission estimates from the example facility, see the memorandum titled *Development of Emissions Estimates for Fugitive or Intermittent HAP Emission Sources for an Example Integrated Iron and Steel Facility for Input to the RTR Risk Assessment* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0956), hereafter called the ''Example Facility memorandum.''

TABLE 3—INHALATION RISK RESULTS—EXAMPLE FACILITY WITH AND WITHOUT UFIP EMISSIONS

Emissions	Example facility sources	Inhalation chronic cancer				Inhalation chronic noncancer		Acute noncancer	
		MIR (in 1–M)	Incidence	Pop >1-in-1 million	Pop >10-in-1 million	HI (TOSHI)	Target organ	HQ	Pollutant
Actual	Point Sources *Only*	2	0.010	3,000	0	0.03	Developmental	0.3	Arsenic
	Point Sources & UFIP Emissions	20	0.12	4,000,000	9,000	0.3	Developmental	3	Arsenic
Allowables	Point Sources *Only*	30	0.13	4,000,000	11,000	0.3	Developmental		
	Point Sources & UFIP Emissions	50	0.24	4,000,000	90,000	0.7	Developmental		

Although we did not assess multipathway risks for the example facility used to represent a ''worst case'' for UFIP emissions, the highest exposed individual for dioxins/furans in the point source modeling was not due to the example facility. Furthermore, none of the UFIP sources are known to emit dioxins/furans emissions. In addition, because mercury is emitted as a gas, UFIP emissions, which are PM, did not add to mercury emissions. See the Example Facility memorandum cited above for more information on the estimated emissions from the model facility.

Furthermore, it is important to note that after the EPA completed its risk modeling, the American Iron and Steel Institute (AISI) provided additional, more recent test data for the example facility that suggest arsenic emissions are lower than the level we estimated based on the 2011 information collection request (ICR) data that we used in our analysis (Docket ID Item No. EPA–HQ–OAR–2002–0083–0804). The AISI also conducted their own risk assessment using the new data and using the same modeling methodology that the EPA uses. The results presented by AISI (described in the EPA's proposal preamble at 84 FR 42704) indicate the MIR when the UFIP emissions are included could be about 60 percent lower than the estimated value in the EPA's risk characterization presented above (*i.e.,* 8-in-1 million compared to the EPA's estimate of 20-in-1 million) and that population risks also could be substantially lower than the EPA's estimate presented above in this preamble, with an estimated 500,000 people with risks greater than or equal to 1-in-1 million compared to the estimate of 4,000,000 in the EPA's risk characterization. Therefore, we conclude the emissions used in our risk assessment are likely conservative (upper-end) estimates.

In determining whether risks are acceptable for this source category, the EPA considered all available health information and risk estimation uncertainty that includes the uncertainty in the data from both point sources and the estimated UFIP emissions. (See proposal at 84 FR 42716, section III.C.8, *How do we consider uncertainties in risk assessment*?) A more thorough discussion of the uncertainties is included in the *Residual Risk Assessment for the Integrated Iron and Steel Manufacturing Source Category in Support of the Risk and Technology Review 2020 Final Rule,* available in the docket for this rule (Docket ID No. EPA–HQ–OAR–2002–0083).

The risk results indicate that the inhalation cancer risks to the individual most exposed could be more than 70-in-1-million but less than 90-in-1 million, as a worst case, based on the highest allowable emissions due to point sources among the industry facilities plus the conservative estimate of risk from UFIP emissions, and also considering the uncertainties in the example facility analysis as discussed above and in the proposal (84 FR 42716). This worst case risk is still below the presumptive limit of 100-in-1 million risk. In addition, there were no facilities with an estimated maximum chronic noncancer HI greater than or equal to 1 from point sources. The maximum acute HQ for all pollutants was less than 1 when we only considered point source emissions, and up to 3 based on the REL for arsenic when including exposures to estimated emissions from UFIP emissions at the example facility.

For the acute screening analyses, to better characterize the potential health risks associated with estimated worst-case acute exposures to HAP, the EPA examined a wider range of acute health metrics, where available, including the California Reference Exposure Levels (RELs) and emergency response levels, such as Acute Exposure Guideline Levels and Emergency Response Planning Guidelines. This is in acknowledgement that there are generally more data gaps and uncertainties in acute reference values than there are in chronic reference values. The maximum acute HQ is estimated to be no more than 3 from arsenic emissions, based on the acute REL. However, for arsenic, the only available acute health metric is the REL. By definition, the acute REL represents a health-protective level of exposure, with effects not anticipated below those levels, even for repeated exposures; however, the level of exposure that would cause health effects is not specifically known. As the exposure concentration increases above the acute REL, the potential for effects increases. In addition, the acute screening assessment includes the conservative (health protective) assumptions that every process releases its peak hourly emissions at the same hour, that the near worst-case dispersion conditions occur at that same hour, and that an individual is present at the location of maximum concentration for that hour. Further, the HQ value was not refined to an off-site location, which, in many cases, may be significantly lower than that estimated at an on-site receptor. Thus, because of the conservative nature of the acute inhalation screening assessment as well as the conservative bias in the UFIP emission estimates, the EPA anticipates that emissions from the Integrated Iron and Steel Manufacturing Facilities source category pose minimal risk of adverse acute health effects.

As part of the ample margin of safety analysis performed for the proposal, we

evaluated additional potential technologies for controlling point source emissions to further reduce risk from these sources, taking into consideration costs, energy, safety, and other relevant factors. We evaluated the installation of a wet electrostatic precipitator (ESP) on the exhaust of the current air pollution control devices for the BF casthouse primary units to reduce chromium VI and arsenic emissions, respectively. We also evaluated the installation of activated carbon injection (ACI) systems onto current control devices for the sinter plant windbox to reduce emissions of dioxins/furans. Details of the estimated costs and emissions reductions associated with these control measures can be found in the memorandum titled *Ample Margin of Safety for Point Sources in the II&S Industry* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0952).

We estimated the MIR could be reduced by 95, 95, and 98 percent, respectively, from 10-in-1 million, 70-in-1 million, and 40-in-1 million for BF chromium actual emissions, BOPF arsenic allowable emissions, and sinter plant dioxins/furans actual emissions as toxic equivalents, respectively. However, we did not propose any of these control scenarios because of the relatively high capital and annualized costs compared to a relatively low amount of emissions reduced. Cost-effectiveness estimates were determined to be $1.9 billion/ton ($940,000/lb), $46 million/ton ($23,000/lb), and $188 billion/ton ($94 million/lb) for BF chromium, BOPF arsenic, and sinter plant dioxins/furans, respectively. None of these options were considered cost effective.

We also considered potential work practices to reduce UFIP emissions as part of the ample margin of safety analysis. The EPA identified work practices that could achieve HAP reductions from the seven UFIP sources, such as more frequent measurements (*e.g.,* opacity, internal furnace conditions) to identify problems earlier, increased maintenance, applying covers on equipment, developing operating plans to minimize emissions, optimizing positioning of ladles with respect to hood faces, and earlier repair of equipment. We estimated these work practices would achieve a range of 50- to 90-percent reduction in UFIP emissions (*i.e.,* control efficiency) from these sources, based on EPA staff judgment as to the potential effectiveness of the work practices. In analyzing post-control scenarios, we assumed the work practices would achieve 70-percent reduction in emissions (the midpoint between 50 and 90 percent), corresponding to an estimate of 185 tpy of HAP reduced, assuming work practices were required for all seven UFIP sources. A description of the uncontrolled UFIP emissions and an estimate of emissions after implementation of work practices are provided in the Example Facility memorandum cited above.

To estimate the risk reductions that could be achieved from the UFIP sources via work practices, we developed a model input file to reflect the estimated emissions reductions that would be achieved under two control options and modeled two post-control scenarios for the example facility to estimate risk reductions. We analyzed two options: Option 1 would establish work practice standards for two of the UFIP sources (BF casthouse fugitives and BOPF shop fugitives), which contribute about 70 percent of the MIR and are currently regulated via opacity standards; Option 2 would establish work practice standards for all seven of the UFIP sources. Potential work practices for the two UFIP sources in Option 1 were the same in Option 2. We assumed a control efficiency of 70 percent for the work practices as the average of an assumed range of 50-percent to 90-percent control efficiency for the work practices. Details of the work practices for UFIP and estimated costs of the work practices can be found in the memorandum titled *Ample Margin of Safety for Nonpoint Sources in the II&S Industry* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0953).

Based on this modeling assessment, we estimated Option 1 would reduce the MIR from 20-in-1 million to about 10-in-1 million for the example facility, the estimated population with risks greater than or equal to 1-in-1 million would decrease from 4,000,000 to 1,500,000, and the estimated population with risks greater than or equal to 10-in-1 million would decrease from 9,000 to 800. In addition, the maximum acute HQ would decrease from 3 to 2. This option also would achieve reductions in PM with a diameter of 2.5 micrometers or less ($PM_{2.5}$). For Option 2, we estimated the work practices would reduce the MIR from 20-in-1 million to about 9-in-1 million for the example facility, the estimated population with risks greater than or equal to 1-in-1 million would decrease from 4,000,000 to 800,000, and the estimated population with risks greater than or equal to 10-in-1 million would decrease from 9,000 to 0. Also, the maximum acute HQ would decrease from 3 to 0.9. This option would also achieve reductions in $PM_{2.5}$.

We estimated the total capital costs of Option 1 for the source category would be approximately $1.4 million, annualized costs would be approximately $1.7 million per year, and HAP reductions would be approximately 173 tpy of HAP, which corresponds to a cost-effectiveness value of approximately $10,000/ton. This estimate was based on cost estimates for individual emission units that were projected to the entire industry based on the number of units of each type at each facility. For Option 2 for the source category, we estimated the total capital costs would be approximately $8.7 million, annualized costs would be approximately $3 million per year, and HAP reductions would be approximately 185 tpy, which corresponds to a cost-effectiveness value of approximately $16,000/ton HAP.

Considering all of the health and environmental risk information and factors discussed above, including the substantial uncertainties regarding our estimates of UFIP emissions, and the costs and cost effectiveness of the work practices, the EPA proposed that risks from the Integrated Iron and Steel Manufacturing Facilities source category are acceptable and that revision of the standards is not required in order to provide an ample margin of safety to protect public health or to prevent an adverse environmental effect.

2. How did the risk review change for the Integrated Iron and Steel Manufacturing Facilities source category?

No changes were made to the risk review in the final rule. As mentioned above, we received new arsenic performance test data and an industry conducted risk assessment for the example facility from industry shortly before proposal suggesting arsenic emissions and risks are about 60 percent lower than our estimates.[3] (See 84 FR 42720 (August 16, 2019) for more discussion). However, we did not rerun the risk model after proposal because of the court-ordered schedule to complete the final rule[4] and because it would not affect the outcome of the final rule. We proposed risks were acceptable and the NESHAP provided an ample margin of safety to protect public health. Based on

[3] Letter and attachment from P. Balserak, AISI, Washington, DC, to C. French, U.S. EPA, Research Triangle Park, NC. 34 pages. February 4, 2019. (Docket ID Item No. EPA–HQ–OAR–2002–0083–1014).

[4] The EPA is required by court order to complete the RTR for the Integrated Iron and Steel Manufacturing Facilities source category by May 5, 2020. *Calif. Communities Against Toxics* v. *Wheeler,* No. 1:15–cv–00512, Order (D.D.C. March 13, 2017, as modified February 20, 2020).

consideration of comments and information received through the comment period, we continue to conclude risks are acceptable and that the NESHAP provides an ample margin of safety to protect public health.

3. What key comments did we receive on the risk review, and what are our responses?

This section provides a summary of key comments and responses regarding the risk review. A summary of all other public comments on the proposal related to the risk review and the EPA's responses to those comments is available in the document, *Summary of Public Comments and Responses for the Risk and Technology Review for Integrated Iron and Steel Manufacturing Facilities* (Docket ID No. EPA–HQ–OAR–2002–0083). With regard to UFIP emissions and potential work practices, key comments and responses in regard to risk are discussed below. Other key comments and responses are discussed under the sections in this preamble on technology review (Section IV.B of this preamble) and UFIP (Section IV.F). The remainder of the UFIP comments and responses are discussed in the response to comment document cited above.

Comment: One commenter stated the EPA has failed to provide an ample margin of safety. The commenter stated at the ample margin stage, the EPA refuses to address the fact that the health risks are quite high. The EPA must consider how to assure an ample margin of safety to protect public health from the systemic harm implied by this risk value. Yet, the EPA does not discuss or find that it is providing any margin, much less an ample one, to protect people from the emissions causing the carcinogenic, chronic noncancer, and acute risks it also found.

In contrast, a different commenter stated the conservative residual risk estimates in the proposal are already well below the presumptively acceptable risk threshold, despite being artificially inflated due to inaccurate emissions inputs and modeling parameters. Thus, the Agency's proposed determination that no additional regulatory requirements are necessary to provide an ample margin of safety or to prevent adverse environmental effect in light of relevant factors including safety and costs is unquestionably reasonable and appropriate.

Response: We acknowledge the comments supporting the EPA's ample margin of safety analysis and the determination that risks are acceptable and no additional regulatory requirements are necessary to provide an ample margin of safety or to prevent adverse environmental effect. A summary of the EPA's ample margin of safety analysis is provided in section IV.A.1 of this preamble and in the proposal preamble (84 FR 42704). Further details are provided in the memorandum titled *Ample Margin of Safety Analysis for Point Sources in the Integrated Iron and Steel Industry* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0952). In this memorandum, we estimate the remaining risk after implementation of potential control technologies and work practices along with the costs of these controls and work practices.

The EPA disagrees with the comments that the EPA failed to satisfy the CAA requirement to provide an ample margin of safety and only addressed whether cost-effective measures were identified for reducing HAP emissions. The EPA uses ''a two-step standard-setting approach, with an analytical first step to determine an 'acceptable risk' that considers all health information, including risk estimation uncertainty, and includes a presumptive limit on MIR of approximately 1-in-10 thousand,'' as stated in the Benzene NESHAP (54 FR 38045), followed by a second step to set a standard that provides an ''ample margin of safety,'' in which the EPA considers whether the emissions standards provide an ample margin of safety to protect public health in consideration of all health information, including the number of persons at risk levels higher than, approximately, 1-in-1 million, as well as other relevant factors, including costs and economic impacts, technological feasibility, and other factors relevant to each particular decision.

As explained above, we determined, based on our risk analysis, the risks from the source category are acceptable and that no additional regulatory requirements are necessary to provide an ample margin of safety to protect public health.

Regarding potential controls for point sources (described in section IV.A.1 of this preamble), we determined these controls would reduce risks, but were not cost effective. The calculated cost-effectiveness values were $940,000/lb, $23,000/lb, and $94 million/lb for HAP removed from BF (chromium VI), BOPF (arsenic), and sinter plants (dioxins/furans), respectively.

With regard to the UFIP and potential work practices, consistent with our explanation in the proposed rule (see 84 FR 42704), based on consideration of all our analyses and related information, including the risk results, costs, and uncertainties, we have determined that no additional standards are required under CAA section 112(f) and that the current NESHAP provides an ample margin of safety to protect public health. This decision is based largely on the substantial uncertainties in the estimates of the baseline HAP emissions from UFIP emission sources, costs of the work practices, HAP risk reductions that would be achieved by the work practices, and uncertainties raised by industry in their comments regarding potential effects of the work practices on the facilities' operations, safety, and economics.

Comment: One commenter stated the multipathway risk did not include UFIP sources. Since the EPA only considered UFIP emissions from the one facility, the commenter inquired about the population that resides in the area impacted by all four mills along a short 20 mile stretch of northwest Indiana. The commenter questioned whether the cumulative risk from inhalation from total point, and UFIP sources for people who live within the impacted areas from all of these mills together was addressed because it does not appear to have been assessed in this proposal. The commenter asserted the EPA has significantly underestimated the exposure for people who live near more than one of the four mills in an approximately 20-mile area of northwest Indiana. The commenter stated the EPA's risk model results, when UFIP emissions are included for the example facility alone, increase by an order of magnitude. The commenter asserted that by itself this should have made it imperative that the EPA consider UFIP sources as important as point sources in quantifying emissions and risks and considering control measures in the final rule.

Another commenter stated documents in the rule docket show serious, harmful, and major releases of pollution, demonstrated in photographs and in high opacity or visible smoke, and in inspections and communications with enforcement officials. The commenter asserted that this information shows the need for stronger standards under each provision of the CAA. The commenter concluded that by not including UFIP emissions in its multipathway assessment, the EPA has underestimated health risks and the already high health threats communities are facing. The commenter stated the EPA has recognized that its residual risk assessment fails to account for several types of pollution that the EPA calls UFIP emissions. The commenter stated the EPA is also refusing to complete a risk assessment for all sources, including the UFIP emission points, and

this is unlawful. The commenter asserted the EPA needs to complete a new risk assessment study, where they include all of the risk factors, to protect the health of Americans that are living around these steel facilities.

Response: The commenter is correct that the UFIP emissions were considered later in the process of developing the RTR and, therefore, were not included in the quantitative multipathway analysis. The EPA would not have been able to meet the RTR court-ordered deadline if the multipathway analysis was repeated to include UFIP emissions or if the risk assessment was repeated to include UFIP emissions from all facilities. However, we qualitatively considered the potential impact of UFIP emissions on the multipathway analysis and concluded that including UFIP emissions would not have affected the results or conclusions of the analysis. Specifically, the HAP driving the risks in the multipathway analysis were dioxins/furans from sinter plants (with a cancer risk estimate for the highest exposed individual of 40-in-1 million from the fisher scenario). In contrast, the UFIP HAP emissions are particulate HAP metals (such as arsenic) from the BF and BOPF related sources, and do not include dioxins/furans. The combined metal HAP from all point sources at the three facilities in the multipathway analysis showed a significantly lower risk (with a cancer risk estimate of 2-in-1 million from arsenic emissions from the gardener scenario) as compared to the risk estimated from dioxins/furans noted above. Therefore, even if we took estimated arsenic emissions from UFIP sources into account in the multipathway analysis, the multipathway risks from the gardener scenario would almost certainly remain lower than the dioxins/furans risk from the fisher scenario. Thus, we have no reason to believe that including arsenic emissions from UFIP sources in the multipathway analysis would alter our conclusion from the multipathway analysis.

Obtaining measurements of UFIP emissions via source testing to combine with the point source emissions was not possible due to the court-ordered deadline and, more importantly, because measurement of UFIP sources would be very difficult, if not impossible, for some sources. To balance the difficulty of obtaining reasonably accurate information on HAP emissions from UFIP sources with the importance of gaining some understanding of the potential risk from UFIP, we modeled a very large facility with the highest expected UFIP (and HAP) emissions, which is also close to a large urban area to estimate the potential upper-end risks due to such emissions. Using the example facility analysis was also a time-saving measure in lieu of estimating UFIP emissions for the entire industry via emission factors.

Comment: One commenter stated the EPA found that a list of effective controls, work practices, and monitoring methods for UFIP sources could achieve HAP reductions from the seven UFIP sources. The commenter stated the EPA's findings are extensive, and are noted as being available, with emissions ''preventable,'' with many practices identified as ''having no or minimal cost'' (ample margin of safety memorandum at 7), and that some facilities are actually using currently. See, *e.g.,* Id. at 7–15. The commenter further stated the EPA found that the experience of its regional staff provided the reason for consideration of these controls. The commenter continued that the EPA recognized some iron and steel sources have had serious compliance problems in the past and highlighted some provisions, like stronger monitoring, that would reduce and prevent those problems. The commenter stated the EPA also provided photographs (at undisclosed locations) that show huge visual releases of HAP metals and other pollution into the air from bell leaks, beaching, and BF slips. The commenter noted that the care the EPA staff took to research, compile, and discuss the important pollution control methods is appreciated.

The commenter stated the Ferroalloys and Secondary Lead Smelting NESHAP each include a number of methods or variations on the methods described in the Integrated Iron and Steel Manufacturing Facilities RTR proposal to reduce metal HAP emissions from UFIP—such as requiring total or partial building enclosure with negative pressure. In addition, the commenter asserted the EPA has recognized the need to prohibit uncontrolled releases of HAP to the atmosphere from planned or unplanned openings at other kinds of facilities. For example, the commenter noted that the EPA, in a long list of CAA section 112 rulemakings in recent years, has repeatedly prohibited uncontrolled HAP releases that vented directly to the atmosphere rather than being routed to a control device.

The commenter stated the EPA ultimately proposes not to require any of the work practices, referring to ''uncertainties regarding the effect the work practice standards would have on facility operations, economics, and safety.'' The commenter stated the EPA's own analyses and direct observations all support better characterizing UFIP emissions and implementing the basic cost-effective control measures and work practices the EPA has already explored to some extent. To not do so, the commenter asserted, would be to ignore the EPA's own analyses of the impacts to human health and the environment of the UFIP emissions from the mills in these highly affected areas, and miss the opportunity to implement easy cost and industry-friendly actions that would go far to reduce impacts to the nearby communities, land, and waterways. The commenter asserted the EPA may not lawfully or rationally refuse to set emission standards that reflect the emission reduction methods available.

Response: We agree with the commenter that work practices to reduce UFIP emissions are available. However, due to the substantial uncertainties regarding the emissions estimates, the uncertainties regarding the costs and effectiveness of the work practices, and potential negative effects of the work practices on facility operations, economics, and safety that were asserted by industry representatives (see below in their detailed comments), the EPA is not promulgating any work practice requirements for UFIP sources in this final rule at this time. Because we conducted a risk assessment for the largest facility in the source category to examine a worst-case scenario for UFIP sources in the industry (as described in detail in section IV.A of this preamble) and determined that risks posed by emissions from the source category were acceptable, and due to the uncertainties and other factors described above, we conclude that the NESHAP provides an amply margin of safety and additional standards, such as work practices described above, are not necessary. In addition, because of the same uncertainties and potential impacts described above for the UFIP sources and work practices, we also are not promulgating any work practice standards under CAA section 112(d)(6) for the two regulated UFIP sources in this action.

Comment: One commenter stated the EPA is right to conclude that additional control technologies, including wet ESPs for BF casthouses and BOPF shops and ACI systems for sinter plant windboxes would not provide cost-effective emissions reductions, given the extremely high costs associated with small incremental additional reductions of HAP.

The commenter asserted that the EPA's ''very high'' cost estimates are

actually low, *i.e.,* underestimated, and that the removal rate estimates are high, *i.e.,* overestimated. The values that the EPA calculated are so clearly not cost effective, however, that further analysis of these costs and reduction levels is unnecessary to reject them under an ample margin of safety analysis. The EPA's proposed determination is, thus, well within the substantial discretion afforded to it under the Court's *Vinyl Chloride* decision and should be finalized.

Response: We acknowledge the comments supporting the EPA's proposed determination that no new standards are required to provide an ample margin of safety to protect public health and that the costs of the control technologies evaluated and emission reductions estimated in the ample margin of safety analysis were not in the range generally determined to be cost effective by the EPA. The costs of additional controls are disproportionately high considering the reductions in risk that are achievable.

Comment: One commenter stated it is arbitrary for the EPA to find risk acceptable in view of additional evidence of uncertainty in the record. The EPA should find the current health risks to be unacceptable because of the omissions, underestimates, and uncertainties its own risk assessment contains. The EPA has failed to show, based on evidence in the record, that the risks are not significantly higher than the values it has presented. The EPA has failed to justify its acceptability determination when such major gaps are present.

Response: As stated in the proposal rulemaking, the estimated combined worst-case, upper-end risks (point and UFIP) are below the presumptive limit of acceptability of 100-in-1-million and the noncancer results indicate there is minimal likelihood of adverse noncancer health effects due to HAP emissions from this source category. As we explained in the proposal preamble, the EPA's risk results indicate that the inhalation cancer risks to the individual most exposed are less than 90-in-1 million, as a worst case, considering the highest allowable risk due to point sources among the industry facilities plus the conservative estimate of risk from UFIP emissions due, in part, to the use of the largest facility as the example facility. Furthermore, we conclude that by using the UFIP emissions estimate from the example facility plus the highest allowable point source risk to represent the worst case risk scenario for the industry mitigates any potential concerns regarding the lack of UFIP emissions estimates and associated UFIP associated risks for each individual facility. Furthermore, we did not receive any data or information through the public comment process that would change our proposed determination that risks are acceptable.

Comment: One commenter stated the EPA's ICR did not collect emissions data information on UFIP sources or all HAP emitted, controlled and uncontrolled. The EPA assessed additional particulate and metal HAP emissions from UFIP sources not addressed in the ICR through estimates based on ''literature values for PM from these or other similar emission points and ratios of HAP to PM developed from the ICR data.'' The commenter also stated the EPA's ''actual'' analysis of risk is based on an emission inventory that is largely calculated from emission factors and engineering judgment. The commenter asserted that it is well-documented that emission factors underestimate emissions for a variety of reasons including inherent bias in the factors themselves and the inability to account for equipment malfunctions and environmental conditions. The commenter stated the EPA cannot rationally base emission estimates or risk assessments on data it has strong reason to doubt. The commenter stated the EPA must collect actual emissions data to support its emissions estimates. The commenter argues that, to the extent actual data is not collected, the Agency must adjust the emissions inventory using these same conclusions from the technology review and the large body of scientific evidence that show emissions factors underestimate emissions, in order to ensure that the inventory better represents reality and reflects actual emissions.

One commenter stated that the proposal's UFIP source analysis (*i.e.,* effort to quantify UFIP emissions) is based on no sampling or engineering analysis, but on very dated studies and emission factors that are poorly rated. While it is more difficult to characterize the emissions from UFIP sources, the commenter asserted that methods do exist that can help in properly characterizing UFIP emissions. The commenter stated these include grab sampling followed by HAP characterization, use of process knowledge, and engineering assessment/modeling. The commenter asserted that each of these methods could have been used by the EPA to better characterize potential HAP emissions from UFIP.

Response: The commenter is correct that EPA did not require HAP testing from these UFIP sources in the ICR in 2011. The EPA did not have a good understanding of the UFIP sources at the time of the ICR in 2011. Furthermore, it would have been quite difficult to reliably measure the UFIP emissions at that time due to the nature of such emissions and lack of test methods to reliably quantify emissions from these sources for use in the RTR. However, note that we did not use an inventory for any analyses in this RTR, for UFIP or otherwise.

The HAP to PM ratios that were used along with the estimates of PM emissions from UFIP to calculate HAP emissions estimates for UFIP sources for the risk assessment for this action were obtained from ICR source tests and are as good, in terms of quality and, therefore, accuracy, if not better than the grab samples that the commenter suggests because the ICR stack tests were performed continuously over a period of hours providing a composite profile of HAP emissions, whereas grab samples would have been instantaneous and only reflect a discrete moment in time. The EPA used all of the other methods recommended by the commenter to estimate emissions from UFIP sources, specifically: HAP characterization, use of process knowledge, and engineering assessment/modeling, as described in the technical memorandum titled Development of Emissions Estimates for Fugitive or Intermittent HAP Emission Sources for an Example Integrated Iron and Steel Facility for Input to the RTR Risk Assessment (Docket ID Item No. EPA–HQ–OAR–2002–0083–0956), hereafter called the ''Example Facility'' memorandum.

The emission factors used in the example facility analysis were, in most cases, from a number of test reports from various and different facilities that were evaluated and combined into one overall emission factor for each of the seven UFIP sources. Environmental conditions and malfunctions are not included in data used to develop EPA emission factors and the latter are never included in any part of an emission factor analysis. In addition, we have no evidence that based on current industry operation the EPA's emission factors are biased low, in general, *i.e.,* for typical or average conditions. Engineering judgment was used when portions of the emission estimates were missing and was conservative in nature. An analysis using limited ambient emission data previously obtained by the EPA in the vicinity of the example facility, included in the ''Example Facility'' memorandum (Section 7 and Appendix G), indicates the EPA's emissions estimates for UFIP at the example facility are plausible.

4. What is the rationale for our final approach and final decisions for the risk review?

Based on consideration of comments, and all of the health risk information, factors, results, and uncertainties discussed above and in the proposal (84 FR 42704), we conclude the risks due to HAP emissions from this source category acceptable. Furthermore, based on the analyses described in the proposal and elsewhere in this preamble, including the evaluation of potential controls and work practices to reduce emissions and risks, and the costs, effectiveness, and uncertainties of those controls and work practices, and after evaluating comments, we conclude the NESHAP provides an ample margin of safety to protect public health. Finally, based on our evaluation of environmental risks, we conclude that more stringent standards are not necessary to prevent an adverse environmental effect. Therefore, we are not promulgating any additional control requirements pursuant to CAA section 112(f)(2), but instead are readopting the existing standards.[5]

B. Technology Review for the Integrated Iron and Steel Manufacturing Facilities Source Category

1. What did we propose pursuant to CAA section 112(d)(6) for the Integrated Iron and Steel Manufacturing Facilities source category?

In the proposed technology review, we evaluated the cost effectiveness of upgrading fume/flame suppressants used for control of fugitive PM and HAP metal emissions from BF to use of baghouses as control devices. We also evaluated process modifications found in European literature to further reduce dioxins/furans emissions from sinter plants; these potential process controls for dioxins/furans emissions were in addition to the add-on control devices considered for sinter plants under the ample margin of safety analysis for point sources described above. The technology reviews for these two emissions sources were discussed in detail in the proposal (84 FR 42704) and the technical memorandum titled *Technology Review for the Integrated Iron and Steel NESHAP* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0964).

In the proposed technology review, the EPA also evaluated potential work practices to reduce nonpoint source emissions from the BF casthouse and BOPF shop (84 FR 42704). However, the EPA did not propose any of these work practices primarily because there are significant uncertainties in the technical assessment of UFIP emissions that includes estimates of the baseline UFIP emissions, the estimated HAP reductions that would be achieved by the work practices, and the costs of the work practices. In addition, there also are uncertainties in the effect the work practices would have on facility operations, economics, and safety. Based on all our analyses and uncertainties described above, the EPA proposed to find that there are no developments in practices, processes, or control technologies that necessitate revising the standards for these two UFIP sources under CAA section 112(d)(6).

Considering all the information evaluated in our technology reviews for upgrading fume/flame suppressants control on BFs, sinter plant process modifications, and the potential work practices to reduce UFIP emissions from BF casthouse and BOP shop, we did not identify any developments in practices, processes, or technologies that warrant revision of the NESHAP for the currently regulated point or nonpoint sources under section 112(d)(6) of the CAA and, therefore, did not propose any changes to the NESHAP pursuant to section 112(d)(6) of the CAA.

a. Upgrading Fume/Flame Suppressants at BFs to Baghouses

Emissions from BFs are controlled in the integrated iron and steel industry in one of two fundamentally different ways: (1) Fume and flame suppression techniques or (2) conventional ventilation practices that route exhaust air to control devices such as baghouses. Fume suppression consists of blowing natural gas over the open equipment which retards vaporization and prevents emissions. With flame suppression, the natural gas is ignited with accompanying oxygen consumption that suppresses the formation of metal oxide emissions. The use of fume/flame suppressants for control of fugitive BF casthouse emissions is estimated to have 75-percent control, whereas control with baghouses is estimated to have 95-percent control.

There are a total of eight BFs with fume/flame suppressants distributed at four facilities among the 21 BFs total at 11 integrated iron and steel facilities. Per-unit capital costs for converting from fume/flame suppressant control to baghouses was estimated to be $18 million with $2.7 million in annual unit costs, where some facilities have two or three units. Total industry costs are estimated to be $140 million in capital costs and $22 million in annual costs. The estimated cost effectiveness of upgrading the fume/flame suppressant control to ventilation and baghouses at all eight BFs is $7 million/ton of metal HAP with 3 tpy of HAP removed, and $160,000/ton PM with 120 tpy of PM removed. We concluded these controls were not cost effective and, therefore, we did not propose to require baghouses to be installed on BFs as a result of the technology review.

b. Process Modifications To Control Dioxins/Furans at Sinter Plants

There are three facilities in the Integrated Iron and Steel Manufacturing Facilities source category that have sinter plants. The sinter plants are currently regulated by PM and opacity limits on the windbox exhaust stream, sinter cooler, and discharge end of sinter plants. In addition, the sinter plant windbox is regulated for organic HAP with compliance demonstrated by either meeting a VOC limit or a limit on oil content of the sinter feed. Dioxins/furans are components of the organic HAP but because of their higher toxicity, they often are evaluated separately under control scenarios. Therefore, our technology review included exploration of potential control measures that could further reduce dioxins/furans from sinter plants.

For the proposal, we conducted a literature search and reviewed various technical publications (largely from Europe and other countries in the Stockholm Convention[6]) regarding potential control technologies and practices to reduce dioxins/furans from sinter plants and found a number of potential options that could potentially be applied at sinter plants in the U.S.[7][8][9] These options include urea injection to inhibit dioxins/furans formation; partial

[5] The Court upheld this approach to CAA section 112(f)(2) in *NRDC* v. *EPA,* 529 F.3d 1077, 1083 (D.C. Cir. 2008): ''If EPA determines that the existing technology-based standards provide an 'ample margin of safety,' then the Agency is free to readopt those standards during the residual risk rulemaking.''

windbox exhaust gas recirculation; post-exhaust windbox chemical spray (monoethanolamine and triethanolamine dissolved in water and sprayed onto exhaust); and elimination of certain inputs (*e.g.,* no ESP dust). The European Union also included these measures in their 2013 Best Available Technology evaluation.[10]

As far as we knew at proposal, none of these technologies or practices were currently used at sinter plants in the U.S. However, based on the literature cited above, we believe some of these technologies or measures may be used to control dioxins/furans in other countries (such as in Europe and other countries complying with the Stockholm Convention).

We were not able to estimate the costs of these control methods due to lack of cost information in the literature, nor were we able to estimate the feasibility for U.S. facilities. Based on the analysis set forth in the proposal, we did not propose to require process modifications to control dioxins/furans at sinter plants as a result of the technology review.

c. Work Practices as a Potential Measure To Reduce UFIP Emissions From BF Casthouses and BOPF Shops

As described in the proposal, we evaluated potential work practices to reduce uncaptured fugitive emissions from BF casthouses and BOPF shops under our technology review. The estimated capital costs for work practices for these two nonpoint sources were $1.4 million and annualized costs were $1.7 million. We estimated these work practices would achieve about 173 tpy reduction in metal HAP, at an average combined cost effectiveness of $10,000 per ton.

After considering all the information and analyses, we proposed to find that there were no developments in practices, processes, or control technologies that necessitate revising the standards for these two UFIP sources under CAA section 112(d)(6). This decision was based largely on the considerable uncertainties in the technical assessment of UFIP emissions that includes estimates of the baseline UFIP emissions, the HAP emission reductions that would be achieved by the work practices, and the costs of the work practices. In addition, as indicated by the industry in their comments, there are also uncertainties with regard to the effect the work practices would have on facility operations, economics, and safety.

2. How did the technology review change for the Integrated Iron and Steel Manufacturing Facilities source category?

No changes were made to the technology review in the final rule from that proposed for the Integrated Iron and Steel Manufacturing Facilities source category (84 FR 42704).

3. What key comments did we receive on the technology review, and what are our responses?

This section provides a summary of key comments and responses regarding the technology review. Related comments and responses in regard to UFIP emissions are discussed in sections IV.A.3 and IV.F.3 of this preamble. A summary of all other public comments on the proposal and the EPA's responses to those comments is available in the *Summary of Public Comments and Responses for the Risk and Technology Review for Integrated Iron and Steel Manufacturing Facilities* (Docket ID No. EPA–HQ–OAR–2002–0083).

Comment: One commenter stated the record contradicts the EPA's conclusion of no developments for point sources. The evidence shows, ''that there are many techniques to control dioxins/furans emissions from sinter plants,'' through process modifications controls such as windbox gas recirculation or chemical treatment of windbox exhaust, and these are in use at European facilities. Tech. Review Memo at 21. The commenter said that the EPA found chemical treatment could achieve 40- to 90-percent control and that the EPA concluded that the cost effectiveness and success of application of these techniques in the U.S. is not known. *Id.* at 19–20. The commenter stated that the EPA gave no justification for why the application should be different in the U.S., however, nor any evidence showing that these could not be applied or should not be applied in the U.S. The commenter also claimed that the European Union actually requires BAT for control of dioxins/furans emissions and stated that the EPA has no lawful or rational basis to refuse to revise the emission standards to ''tak[e] into account'' these techniques when they are plainly ''developments'' within the meaning of CAA section 112(d)(6). *Id.* at 20.

The commenter stated the EPA's claims about the cost effectiveness of ACI in the proposal were made in the context of its separate CAA section 112(f) analysis (84 FR at 42725) and that the EPA did not evaluate ACI in the context of its CAA section 112(d)(6) analysis. *Id.* at 42729. The commenter also claimed that the EPA's findings under CAA section 112(f)(2) cannot possibly satisfy the Agency's obligations under the separate and different requirements of CAA section 112(d)(6). Stating what the EPA believes ACI costs does not show that ACI is not cost effective and is irrelevant under CAA section 112(d)(6). Equally irrelevant is whether or not ACI would reduce health risks. The focus under CAA section 112(d)(6), is how much reduction is achievable and not the EPA's views about risk or the value of reducing it.

The commenter stated moreover, the Agency grossly underestimates this technology's cost effectiveness by considering it only for one HAP at a time, as if iron and steel sources would have to purchase and install ACI once to control dioxins/furans, and again to control other pollutants. 84 FR 42726 (August 16, 2019). The commenter stated the EPA's irrational failure to recognize the actual benefits of ACI on multiple HAP is arbitrary and unlawful.

In addition, the commenter asserted that the Agency pretends that cost effectiveness must be measured in dollars per ton even for pollutants like mercury and dioxins/furans for which such a measure is ''ridiculous.'' The commenter explained that dioxins/furans are measured in millionths of a gram, and they are toxic in the millionths of a gram. Further, the commenter elaborated that all the industries in the nation do not emit a single ton of dioxins/furans in a year. The commenter posited that giving the cost effectiveness for ACI in dollars per ton of dioxins/furans is meaningless and that by doing so the EPA is simply obscuring the facts by using absurdly irrelevant units to make ACI look as though it is not cost effective to support its rejection of an extremely effective and cost-effective technology.

The commenter stated failing to present all of the underlying information the EPA relied on for its CAA section 112(d)(6) determination—including, *e.g.,* the title V permits to which it refers—makes it impossible for the public and for a reviewing court to evaluate the EPA's conclusory determination that there are ''no developments'' requiring revision.

In contrast, a different commenter stated as part of the technology review, the EPA considered a number of process

[10] *Best Available Techniques (BAT) Reference Document for Iron and Steel Production.* Industrial Emissions Directive 2010/75/EU (Integrated Pollution Prevention and Control). R. Remus, M. A. Aguado-Monsonet, S. Roudier, and L. D. Sancho. European Commission, Joint Research Centre, Institute for Prospective Technological Studies. European IPPC Bureau, Seville, Spain. Luxembourg Publications Office of the European Union. doi:10.2791/97469. 2013.

modifications to provide additional reductions of dioxins/furans emissions from sinter plants but appropriately chose not to propose to require them based on inadequate information. The commenter stated that the EPA reasonably determined not to focus on additional control technologies for sinter plants during the technology review, which are already subject to limits on organic HAP emissions (through either a VOC limit or an oil content limit for the sinter feed). Based on the incredibly high estimated cost-effectiveness numbers, the commenter stated that the EPA proposes that these additional control technologies would not be cost effective and proposes not to require them. Although the commenter stated that the EPA's cost estimates appear unrealistically low and the estimated emissions reductions too high, even with those flawed assumptions the commenter stated that the EPA calculated such staggeringly high cost-effectiveness values that further analysis is unnecessary to establish that these controls are not appropriate to impose pursuant to the technology review. The commenter stated the process modifications the EPA evaluated are not used at any facility in the Integrated Iron and Steel Manufacturing Facilities source category but, rather, were identified during the EPA's literature review from primarily European sources. Sinter plant emissions are already regulated by PM and opacity limits, as well as a VOC limit or limit on sinter feed oil content to regulate organic HAP emissions, including dioxins/furans. The commenter stated that the EPA nonetheless looked to identify the potential process changes in its literature review to yield further dioxins/furans emission reductions. The commenter stated that none of the process changes that the EPA identified warrant revision of the 40 CFR part 63, subpart FFFFF standards for sinter plants. The industry reviewed the materials from the EPA's literature review described in the proposal; however, the commenter stated that the EPA did not provide adequate information to properly evaluate the potential effectiveness, costs, or other issues associated with the process changes discussed therein. Because there has not been a meaningful opportunity to review and comment on any potential requirement the EPA could impose on the basis of that insufficiently clear literature, the commenter stated that none should be adopted in the final rule.

Response: At proposal, we evaluated ACI as a means of reducing dioxins/furans emissions from sinter plants and used the information and data we collected to inform both our ample margin of safety analysis under CAA section 112(f) and our technology review under CAA section 112(d)(6). In addition, we investigated potential process modifications to reduce emissions for the sinter plants under CAA section 112(d)(6). None of the process technologies or practices identified to control dioxins/furans in European sinter plants are currently used at sinter plants in the U.S. Therefore, we were not able to estimate the costs of these control methods due to lack of cost information in the literature, nor were we able to determine the feasibility for U.S. facilities or whether the European facilities that are applying these process modifications are similar enough to U.S. facilities to enable adoption of the same control techniques. Considering all the information in our technology reviews, we did not identify any developments in practices, processes, or technologies that warrant revision of the NESHAP for sinter plants.

We agree with the first commenter that dioxins/furans are commonly expressed in grams. However, in the RTR proposal (84 FR 42704), we provided the emissions for dioxins/furans in measurement units typically used for most other HAP (*i.e.,* tons and lbs) for consistency purposes. Changing measurement units does not change the relative impact of this analysis compared to previous EPA analyses for dioxins/furans.

We agree with the first commenter that we did not specifically discuss ACI for dioxins/furans in the technology review sections of our RTR proposal preamble. However, in the memorandum titled *Technology Review for the Integrated Iron and Steel NESHAP* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0964), we explained (on page 17 of 22) that although add-on controls are available, the focus for the technology review was on process modifications because add-on controls (*i.e.,* ACI) for dioxins/furans emissions were shown not to be cost effective at sinter plants at integrated iron and steel facilities in the ample margin of safety analysis. For details of this analysis, see the memorandum titled *Ample Margin of Safety Analysis for Point Sources in the Integrated Iron and Steel Industry* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0952).

In terms of multiple pollutant control, for the purpose of this comment, because dioxins/furans are quite different than other HAP, we typically would not add together the mass of other individual HAP together with dioxins/furans to generate a cost effectiveness value for the sum of HAP, such as in units of dollars per ton of total HAP or lbs per ton of total HAP. Nevertheless, in response to the comment, we estimated the cost effectiveness to control VOC, such as benzene, toluene, ethyl benzene, and xylene (BTEX), and carbonyl sulfide (COS) with ACI. Using the same annual costs for ACI described for control of dioxins/furans (see 84 FR 42725 (August 16, 2019) and also Docket ID Item No. EPA–HQ–OAR–2002–0083–0952), at $1,849,781 per year, and assuming 85-percent control of BTEX and COS with ACI (average of vendor estimate of 80 to 90 percent),[11] the estimated cost effectiveness for BTEX and COS co-control is approximately $14,000/ton, which is above the range that the EPA has typically considered cost effective for volatile HAP. Consequently, we continue to conclude that ACI is not cost effective for sinter plants, whether we consider ACI for only dioxins/furans controls or if we consider costs and cost effectiveness of the other HAP as well, and we are not promulgating any new or revised standards for sinter plants under the technology review pursuant to CAA section 112(d)(6).

We disagree with the comment that claims the EPA did not provide the underlying information the EPA relied on for its CAA section 112(d)(6) determination. The EPA provided all the relevant supporting information in the proposal preamble or technical memoranda, including the *Technology Review for the Integrated Iron and Steel NESHAP* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0964) and *Ample Margin of Safety Analysis for Point Sources in the Integrated Iron and Steel Industry* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0952). Regarding the title V permits, we made no reference to title V permits in this rule package or any of the supporting materials and technical memoranda; therefore, we cannot address the commenter's points on this issue.

Comment: One commenter stated the EPA cannot justify leaving other non-mercury emissions completely uncontrolled. Refusing to set limits on all uncontrolled pollutants that iron and steel sources emit is both unlawful and arbitrary. The commenter stated that the EPA's emission standards for iron and

[11] Telecommunication. Raymond, G., RTI International, Research Triangle Park, North Carolina, with C. Allen, Carbon Activated Corporation, Blasdell, New York. January 27, 2020.

steel plants lack any limits at all for certain HAP, such as hydrochloric acid (HCl), hydrogen cyanide (HCN), and COS, either direct or through a surrogate. Specifically, the iron and steel plants emit 12 tpy HCl, 4 tpy HCN, and 72 tpy COS. Although the EPA has set certain requirements that purport to be limits on VOC, it has not set any limit for iron and steel plants' emissions of COS. Indeed, when the EPA promulgated the Integrated Iron and Steel Manufacturing Facilities standards, it did not even recognize that they emit COS. Instead, the EPA claimed that iron and steel plants emit only ''trace amounts of other organic HAP (such as polycyclic organic matter, benzene, and carbon disulfide).'' Moreover, the EPA claimed that these ''trace'' emissions come entirely from oil used in the sintering process, and its only limit on them is to ''establish limits on the amount of organic HAP precursor material (specifically oil and grease) that may be in the sinter feed . . .'' The commenter stated because the EPA does not claim that COS emissions either come from organic HAP precursor material in sinter feed or can be reduced by limits on such material, its current standards do not limit emissions of COS. In addition, the extremely dangerous neurotoxicant HCN appears not to be currently restricted at all.

The commenter stated it is well-established that, under CAA section 112(d) of the CAA, the EPA's emission standards for a source category must include limits for each HAP that a source category emits. As the Court held in *National Lime Ass'n,* 233 F.3d 625, 634 (D.C. Cir. 2000), the Agency has a ''clear statutory obligation to set emission standards for each listed HAP.'' In subsequent decisions, the Court has repeatedly confirmed that the EPA has this obligation, that it is unambiguous, and that the EPA's failure or refusal to set limits for each listed HAP that a category emits is flatly unlawful. See, *e.g., Sierra Club* v. *EPA,* 479 F.3d 875, 883 (D.C. Cir. 2007). Despite the plain language of the CAA and the Court precedent, the existing standards do not currently contain any limit at all on certain HAP.

The commenter stated that CAA section 112(d)(6) requires the EPA to review and revise ''as necessary'' the emission standards for integrated iron and steel facilities. This includes ensuring standards apply to all emitted HAPs and satisfying all currently applicable requirements. As part of its review rulemaking under CAA section 112(d)(6) of existing standards to determine whether it is ''necessary'' to revise the standards, EPA must ensure that standards for Iron & Steel facilities meet the requirements of CAA section 112(d), consistent with its responsibility under the CAA and applicable case law.

The commenter stated while the EPA has been ignoring its statutory obligations to control these sources' toxic pollution, people in communities near these sources suffer as a result of their exposure to uncontrolled HAP emissions. The commenter stated as communities currently have no protection at all from these emitted HAP, it is both unlawful and arbitrary for the EPA not to set a limit in this rulemaking. If it fails to do so, it will fail to complete the review and revision rulemaking as CAA section 122(d)(6) requires, will violate the Court's Order in *California Communities Against Toxics* v. *Pruitt,* 241 F. Supp. 3d 199 (D.D.C. 2017), and will also issue a final rule that is unlawful and inadequate.

Response: Section 112(d)(6) of the CAA requires the EPA to review and revise, as necessary (taking into account developments in practices, processes, and control technologies), emission standards promulgated under this section. We do not agree with the commenter's assertion that the EPA must establish new standards for unregulated emission points or pollutants as part of a technology review of the existing standards.[12] The EPA reads CAA section 112(d)(6) as a limited provision requiring the Agency to, at least every 8 years, review the emission standards already promulgated in the NESHAP and to revise those standards as necessary taking into account developments in practices, processes, and control technologies. Nothing in CAA section 112(d)(6) directs the Agency, as part of or in conjunction with the mandatory 8-year technology review, to develop new emission standards to address HAP or emission points for which standards were not previously promulgated. As shown by the statutory text and the structure of CAA section 112, CAA section 112(d)(6) does not impose upon the Agency any obligation to promulgate emission standards for previously unregulated emissions. Establishing emissions standards for unregulated emission points or pollutants involves a different analytical approach from reviewing emissions standards under CAA section 112(d)(6).

Though the EPA has discretion to develop standards under CAA section 112(d)(2) through (4) and CAA section 112(h) for previously unregulated pollutants at the same time as the Agency completes the CAA section 112(d)(6) review, any such action is not part of the CAA section 112(d)(6) review, and there is no obligation to undertake such actions at the same time as the CAA section 112(d)(6) review.[12] In the case of mercury, as described in sections III.C and IV.C of this preamble, the EPA has decided to promulgate new standards pursuant to CAA section 112(d)(2) and (3) to address an outstanding petition for reconsideration. However, the EPA is not establishing new standards for the other HAP described above (*i.e.,* HCl, HCN, and COS) as part of this rulemaking, partly due to the fact that the EPA has insufficient time to gather the information to complete the necessary analyses and review in order to develop such additional standards before the court-ordered deadline of May 5, 2020. Nevertheless, the Agency may address these additional HAP in a future action.

4. What is the rationale for our final approach for the technology review?

Our technology review focused on the identification and evaluation of developments in practices, processes, and control technologies that have occurred since the MACT standards were promulgated. Where we identified such developments, we analyzed their technical feasibility, estimated costs, energy implications, and non-air environmental impacts. We also considered the emission reductions associated with applying each development. This analysis informed our decision of whether it is ''necessary'' to revise the emissions standards.

For the reasons explained in the proposed rule (84 FR 42704) and in this final rule preamble (section IV.B), we determined that there are no developments in practices, processes, or control technologies that warrant revisions to the standards. We evaluated all of the comments on the EPA's technology review and we determined no changes to the review are needed. Consequently, the EPA is not promulgating any new or revised standards in this action for the Integrated Iron and Steel NESHAP under CAA section 112 (d)(6) of the CAA.[12] More information concerning our technology review is in the memorandum titled *Technology Review for the Integrated Iron and Steel*

[12] On April 21, 2020, shortly before this rule was signed, the U.S. Court of Appeals for the D.C. Circuit issued an opinion in *LEAN* v. *EPA* (No. 17–1257) in which the court held that the EPA has an obligation to set standards for unregulated pollutants as part of technology reviews under CAA section 112(d)(6). At the time of signature, the mandate in that case had not been issued and the EPA is continuing to evaluate the decision.

NESHAP (Docket ID Item No. EPA–HQ–OAR–2002–0083–0964).

C. Mercury Emission Limits

1. What did we propose for mercury emissions for the Integrated Iron and Steel Manufacturing Facilities source category?

On August 16, 2019, the EPA proposed emissions standards for mercury for the Integrated Iron and Steel Manufacturing Facilities source category pursuant to CAA section 112(d)(3) in part to address a petition for reconsideration received by the EPA in 2004 from the Sierra Club. The proposed MACT floor limit was 0.00026 lbs of mercury per ton of scrap processed as an input-based limit for all existing BOPFs and related units at existing integrated iron and steel facilities. We proposed two options to demonstrate compliance with the input-based limit of 0.00026 lbs of mercury per ton of scrap processed for existing facilities. These options were: (1) Conduct an annual performance test at all BOPF-related units and convert the sum of the results to input-based units (*i.e.,* lbs of mercury per ton of scrap input) and document the results in a test report that can be submitted electronically to the delegated authority with the results (see section IV.E below); or (2) certify that the facility obtains all of their scrap from NVMSRP participants (or similar program as approved by the delegated authority), or establish that their scrap is not likely to contain mercury switches. We proposed that existing sources would be required to comply with these requirements within 1 year of promulgation of the final rule. We also proposed that for facilities demonstrating compliance with the mercury limits through performance testing, subsequent performance testing would be required annually. In addition, we proposed that facilities demonstrating compliance through the scrap selection options, would be required to report their status with the appropriate required information in their semiannual compliance reports beginning 1 year after promulgation of final rule.

For new sources, we proposed a MACT limit of 0.00008 lbs of mercury per ton of scrap processed as an input-based limit for any new BOPF and related units, and new integrated iron and steel facility, pursuant to the CAA section 112(d)(3) requirements for new sources that the standard for new sources shall not be less stringent than the emission control that is achieved in practice by the best controlled similar source. With regard to compliance, the EPA proposed that new sources would have the same options to demonstrate compliance as the existing sources. A new BOPF and new integrated iron and steel facility was defined, with respect to the mercury standard, to be any BOPF or facility constructed or reconstructed on or after August 16, 2019.

2. How did the mercury emissions standards change for the Integrated Iron and Steel Manufacturing Facilities source category?

For the final rule, in response to comments, we changed the mercury testing frequency after the initial performance test to twice per permit cycle, *i.e.,* every 2.5 years in a 5-year title V permit cycle or every 2.5 years for facilities without a permit (where the initial performance test is performed within 1 year from the effective date of the rule); changed definitions for motor vehicle scrap; changed 40 CFR 63.7825 Equation 1 to reflect the correct calculation for mass emissions; and changed minor aspects of provisions that allow sources to demonstrate compliance through participation in the NVMSRP and other provisions related to compliance with the mercury limits. These changes are described in sections III.C, IV.C.4, and IV.C.5 of this preamble.

3. What key comments did we receive on the mercury emissions standards, and what are our responses?

This section provides a summary of key comments and responses regarding the mercury standard. A summary of all other public comments on the proposal and the EPA's responses to those comments is available in the *Summary of Public Comments and Responses for the Risk and Technology Review for Integrated Iron and Steel Manufacturing Facilities* (Docket ID No. EPA–HQ–OAR–2002–0083).

Comment: One commenter stated the EPA has appropriately proposed a measure to reduce mercury emissions, which the emission standards currently do not control, by (proposing to) set standards for the first time pursuant to CAA sections 112(d)(2) and (3). (84 FR 42730). The commenter urged the EPA to finalize this measure, but also asserted that it does not satisfy CAA section 112(d)(6). The commenter added, as the EPA acknowledges, the EPA also has a pending petition for reconsideration asking the EPA to set mercury limits. (*Id.* at 42,731). The EPA granted the petition on the issue of the mercury limits. The commenter opined that the EPA should not have waited 15 years to propose measures to reduce iron and steel plants' mercury emissions, and its current proposal falls short of the CAA's requirements. (*Id.*).

The commenter stated the EPA's proposed practices for the removal of mercury switches from the scrap metal used by iron and steel plants are not numeric emission limits. At best, the commenter stated, they constitute a work practice requirement the EPA has not even claimed, let alone shown, as it must under CAA section 112(h), that the statutory preconditions for setting work practice requirements instead of numeric emission limits have been satisfied. For this reason alone, the commenter asserted that the EPA's proposed mercury requirements are unlawful and arbitrary.

The commenter asserted that the limits fail to satisfy the stringency requirements under CAA sections 112(d)(2) and (3). Specifically, the commenter argues that the EPA has not demonstrated with substantial evidence, as it must, that these requirements reflect the mercury emissions levels actually achieved by the plants that are best-performing with respect to mercury and contravene CAA section 112(d)(3). Further, the commenter stated that the EPA has neither claimed nor demonstrated that its mercury requirements require the ''maximum'' degree of reduction in mercury emissions that is ''achievable'' through the full range of reduction measures enumerated in CAA section 112(d)(2) and, therefore, this violates CAA section 112(d)(2).

The commenter affirmed that the mercury switch requirements the EPA has proposed should be included in the Agency's final mercury emission limits. The commenter acknowledged that the EPA has the authority to set limits for mercury that reflect, among other things, the application of operational measures, such as the proposed mercury switch requirements. However, they questioned whether such measures are sufficient and asserted that, if not, the EPA must set numeric limits for mercury that satisfy the stringency requirements in CAA sections 112(d)(2) and (3).

The commenter stated that the proposed limits for mercury are unlawfully and arbitrarily weak, because they simply codify what the majority of sources are already doing—instead of ensuring the ''maximum achievable degree of emission reduction.'' (42 U.S.C. 7412(d)(2) and (3); see 84 FR 42730–32, August 16, 2019). The commenter stated that the EPA does not claim that this satisfies CAA sections 112(d)(2) and (3), or determine that numerical emission limits are not feasible.

Response: We acknowledge the support for our proposal to set mercury standards. This is the first time the EPA is promulgating a mercury emissions standard for this source category. Therefore, CAA section 112(d)(6) does not apply. Section 112(d)(6) of the CAA only applies to existing standards and requires that the EPA review existing standards within 8 years, and revise them as necessary, taking into account developments in practices, processes, or technologies.[12]

Pursuant to CAA sections 112(d)(2) and (3), and based on data from all facilities, we proposed MACT floor limits for new and existing sources in terms of lbs of mercury per ton of scrap processed as an input-based limit for all BOPFs and related units (HMTDS and ladles) at integrated iron and steel facilities. These limits, which are in units of mass of mercury emissions from all BOPFs and related units at each facility (hereafter called the ''BOPF Group'' [13]) per mass of scrap processed by each facility in their BOPFs, were derived using performance test data and data on amount of metal scrap processed obtained through an ICR sent to the industry in 2011, and are based in part on the assumption that the mass of mercury emitted from all BOPFs and related units is equivalent to the mass of mercury in the scrap input. Mercury is neither created nor destroyed in the BOPF and, based on our understanding of the steelmaking process, the primary source of mercury emissions is mercury contained in the scrap feedstock. Thus, the EPA determined it was reasonable to set a standard that limits the amount of mercury that may be emitted per ton of scrap processed.

Because we collected test data from BOPF Groups at all facilities in the industry, we necessarily collected test data from the best performing sources. We then used the test data to develop mercury-to-scrap input ratios for the facilities' BOPF Groups and used the best performing five facilities out of all 11 integrated iron and steel facilities in the source category to develop the data set to derive the input-based MACT floor for existing sources for mercury, pursuant to CAA section 112(d)(3). For new sources, we established a standard no less stringent than the emission control achieved in practice by the best controlled source, as determined by the Administrator, pursuant to CAA section 112(d)(3).

Once we established the MACT floor data set, we then determined an upper prediction limit (UPL) [14] to develop the mercury MACT standard that incorporates the potential variability in future measurements. The EPA's MACT analyses use the UPL approach to identify the average emission limitation achieved by the best performing sources to determine the MACT level of performance, or MACT emission limit, as described in the EPA memorandum titled *Mercury Emissions, Controls, and Costs at Integrated Iron and Steel Facilities* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0958). The EPA uses this approach because it incorporates the average performance of the best performing sources as well as the variability of the performance during testing conditions. The UPL estimates what the upper bound of future values will be based upon present or past background data. The UPL approach encompasses all the data point-to-data point variability in the collected data, as derived from the dataset to which it is applied. We then took the mercury mass-to-scrap input ratio from the lowest-emitting facility in regard to mercury and used this value to establish the new source standard, after applying the same UPL procedure. Details of this procedure also are described in the technical memorandum cited above.

After calculating the MACT floor, the EPA evaluated and considered a beyond-the-floor option pursuant to CAA section 112(d)(2) based on ACI. However, for the reasons explained in the proposal preamble, including the relatively high capital and annualized cost of ACI with baghouses, and poor cost effectiveness, the EPA did not propose a beyond-the-floor option and instead proposed the MACT floor emission limits for new and existing sources as described above in this preamble. Additional details of the development of the proposed mercury emission limits and beyond-the-floor analyses are available in the proposed rule preamble and technical document titled *Mercury Emissions, Controls, and Costs at Integrated Iron and Steel Facilities* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0958).

With regard to compliance with the proposed mercury emission limits, we proposed that facilities would have two options to demonstrate compliance with the proposed input-based MACT emission limit: (1) Conduct a performance test annually at all BOPF-related units and convert the sum of the results to input-based units (*i.e.,* lbs of mercury per ton of scrap input) and document the results in a test report that can be submitted electronically to the delegated authority with the results; or (2) certify that the facility obtains all of their scrap from NVMSRP participants (or similar program as approved by the delegated authority), or establish that the facility's scrap is not likely to contain mercury switches.

In the proposal preamble (84 FR 42704), we explained that although we did not know exactly what type of scrap was used when the integrated iron and steel facilities performed the ICR testing for mercury, we assumed the scrap was either NVMSRP scrap or scrap with higher amounts of mercury per ton of scrap than NVMSRP scrap. In response to the proposal, industry (AISI and one facility, U.S. Steel) submitted comments [15] stating that the performance tests conducted to establish the MACT floor limits and, thus, the MACT for mercury in the proposal were based on facilities participating in the NVMSRP. We expect NVMSRP scrap in the future will contain similar levels of mercury or, more likely, less mercury than the scrap used to develop the MACT floor limits because the amount of mercury in scrap is declining overall due to the ban on the use of mercury in switches in U.S. automobiles after 2002, the expected continual retirement of older vehicles, and success of the NVMSRP. Based on the EPA's understanding of the NVMSRP and the commitments made by the parties in the memoranda of understanding, the NVMSRP scrap constitutes some of the cleanest, if not the cleanest, scrap available in terms of mercury content. Therefore, if a facility chooses to comply with the mercury emission limit by certifying that all their scrap is from NVMSRP participants (or a similarly-approved program) or establishes that their scrap does not contain mercury switches, it is also reasonable to conclude that the amount of mercury left in the scrap due to the removal of mercury switches by the

[13] Basic oxygen process furnace group is defined to be the collection of BOPF shop steelmaking operating units including the BOPF primary units (BOPF emissions from oxygen blow for iron refining); BOPF secondary units (secondary fugitive emissions in the shop from iron charging, steel tapping, and auxiliary processes not elsewhere controlled); ladle metallurgy units; and HMTDS and slag skimming units that are operating at the time of each mercury test sequence.

Submitted November 7, 2019.

NVMSRP achieves at least the same level of mercury reduction or likely better reduction compared to the numeric MACT floor limits.

By finalizing this emissions standard for mercury and two options to demonstrate compliance, the EPA has fulfilled its legal obligations under CAA sections 112 (d)(2) and (d)(3).

Comment: One commenter supported the EPA's proposal to continue to rely on the NVMSRP as an effective and efficient means of reducing mercury emissions in the steel industry. The commenter stated mercury is not an ingredient in steel, nor is it intentionally added in the steelmaking process; however, mercury is a contaminant sometimes present in scrap metal feedstock. The commenter acknowledges that the EPA correctly stated in the proposal that the primary source of mercury contamination in scrap metal is mercury-containing convenience switches that were used in automobiles until their use was phased out in model year 2002.

The commenter stated the NVMSRP has been a component of the NESHAP for Area Source Electric Arc Furnaces (EAF) Steelmaking Facilities in 40 CFR part 63, subpart YYYYY (''subpart YYYYY'') for over a decade. As evidenced by the EPA's own data, the commenter noted that the program has been highly effective in removing mercury from scrap feedstock and reducing mercury emissions from EAF mills. The commenter stated as EAF steel production uses a feedstock of nearly 100-percent steel scrap, Steel Manufacturers Association and its members have gone to great lengths to prevent mercury switches and other sources of mercury contamination from entering the scrap metal recycling stream. Foremost among those efforts, the commenter stated, is the development of the NVMSRP in 2006. Since that time, the commenter noted that the NVMSRP and its participants have removed and safely diverted from the scrap supply and environment over seven million mercury convenience light switches containing nearly 7.8 tons of mercury. By removing these switches from scrap feedstock, the commenter stated, the steel industry prevented that mercury from being charged into its furnaces and released into the atmosphere.

The commenter agreed with the EPA that the amount of mercury emitted from steel manufacturers using scrap metal as feedstock has declined significantly due to the elimination of mercury-containing switches in cars in 2002 and the steel industry's efforts through the NVMSRP to ensure that those remaining mercury switches are not charged into steelmaking furnaces. Critically, the commenter stated, the removal of mercury from convenience switches in cars is only one part—albeit, an important part—of a larger trend toward removing mercury from products. The commenter stated that all available data show the downward trend in mercury emissions is continuing and will continue until there are so few remaining pre-2003 vehicles reaching the end of their useful lives that mercury emissions will cease to be an issue for the steel manufacturing industry.

The commenter stated that the facilities in the Integrated Iron and Steel Manufacturing Facilities source category that use automotive shredded scrap inputs obtain automotive shredded scrap solely from suppliers participating in the NVMSRP.[15] Furthermore, the commenter stated, the performance tests conducted to establish the MACT floor limits and, thus, the MACT limits for mercury in this rule were based on these very facilities participating in the program. The commenter stated the NVMSRP seeks to ensure that mercury switches are removed from scrap used in integrated iron and steel and other industries' production processes; this approach allows for responsible recycling of vehicles while minimizing the likelihood of mercury emissions from companies using this scrap to make new products. Based on this, the commenter asserted the EPA has appropriately proposed to account for the NVMSRP.

Response: We agree with the commenter that mercury is not intentionally added to the steelmaking process, that the NVMSRP works to remove mercury from the scrap supply, and that the level of mercury in steel scrap should continue to decline in the future because, based on available information and our analyses, the overwhelming majority of the mercury originates from mercury-containing convenience switches that were used in automobiles until their use was banned in the U.S. after model year 2002.

Comment: One commenter stated that because mercury emissions from scrap consuming facilities are caused by contamination in the scrap feedstock, mercury emissions are necessarily random and episodic. The commenter stated the intermittence of these emissions—and the widespread reduction in sources of mercury contamination—strongly weigh against the imposition of specific numerical limits. The commenter recognized that the EPA believes the Agency is legally compelled to promulgate numerical mercury limits, and the commenter takes no position on whether the Agency is compelled to do so in this rulemaking. The commenter viewed these limits as inappropriate given the nature of mercury emissions in scrap-consuming facilities. The commenter asserted the NVMSRP remains a highly protective and effective surrogate for numerical limits and recommended that the EPA continue to rely on it as such.

Response: As explained above, the EPA has decided to promulgate a mercury emission limit for the BOPF and related processes pursuant to section 112(d) of the CAA in part, to address a 2004 petition for reconsideration. The steel-making units, although by definition a batch process, operate on a cycle where one batch starts as soon as the previous one ends so that the furnace remains operating almost all the time (except for occasional maintenance or repair activities) to prevent cooling and the need to reheat. Three test runs are required for a performance test. The steelmaking process cycle, although a batch process, is sufficiently long enough to allow at least one test run in each cycle. Because the scrap content and amount of mercury in each batch may change from batch to batch, using an average of three runs to develop the standard that the facilities will use to determine compliance (or for any other testing purpose) contributes to the accuracy of the data and, therefore, is to the benefit of both steel facilities as well as the EPA. The final three-run test average, then, is considered representative of typical operations and not just one ''batch.'' Therefore, the EPA determined it was feasible and reasonable to develop a numerical emission limit based on the data we had. However, as explained above, the EPA is including two options to demonstrate compliance: (1) Conduct performance testing; or (2) certify scrap is obtained from suppliers who participate in the NVMSRP or similar program, or is free of mercury switches. With this final rule, the EPA has fulfilled its legal obligations under CAA sections 112(d)(2) and (3) to set emission standards for mercury.

Comment: The commenter stated that the use of a 99-percent UPL to develop the MACT floor for mercury is appropriate and consistent with the EPA's approach in other rulemakings. The commenter stated the ability of the UPL, however, to properly account for variability here is in question, given that 80 percent of the sampling results included at least one mass fraction below the detection limit (non-detect), and 8 percent of total runs included all

non-detect values. In sum, the commenter stated only 12 percent of runs included all detected results, severely limiting the above-detection-limit dataset on which the UPL calculation was based.

Response: In the procedure the EPA uses to develop the MACT standards, the calculated UPL is compared to three times the HAP and method-specific ''representative detection level'' (RDL) developed by the EPA, and the higher value of the two (UPL v. 3xRDL) is used as the MACT standard. This step ensures that the final MACT floor values will be a measurable above-detection-limit value. (See Westlin and Merrill, 2011[14]). When multiplying RDL by a factor of 3, the measurement imprecision is decreased to around 10 to 15 percent. Using the larger value for the MACT standard ensures that measurement variability is adequately addressed.

In regard to the number of below detection limit (BDL) values, see the procedure from the EPA memorandum titled *Determination of ''Non-Detect'' from EPA Method 29 (Multi-Metals) and EPA Method 23 (Dioxin/Furan) Test Data When Evaluating the Setting of MACT Floors Versus Establishing Work Practice Standards* (S. Johnson, U.S. EPA, June 5, 2014) located in the docket to this final rule. In the memorandum (page 8, item 3), there is a discussion of a procedure for data classification for mercury and nonmercury metals obtained via EPA Method 29. According to the procedure: ''Where test results for any single analyte are detection level limited (DLL) or above detection limit (ADL), we assume detection (*i.e.,* ADL) for that test run data for that specific analyte.'' Therefore, the integrated iron and steel mercury data classified as DLL, at 80 percent, are considered ADL and consequently, the number of runs considered ADL is 92 percent, a clear majority of the data set. See summary table of the MACT floor run data below.

TABLE 4—INTEGRATED IRON AND STEEL SOURCE MERCURY MACT FLOOR RUN DATA CLASSIFICATIONS

Source	Data	Number of runs				Percentage of total runs		
		BDL	DLL	ADL	Total	BDL	DLL	ADL
BOPF Group	Before reclassification[1]	7	73	11	91	8	80	12
	After reclassification[2]	7	0	84	91	8	0	92

[1] From the memorandum titled *Mercury Emissions, Controls, and Costs at Integrated Iron and Steel Facilities* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0958).

[2] As per the procedures described in the memorandum titled *Determination of ''Non-Detect'' from EPA Method 29 (Multi-Metals) and EPA Method 23 (Dioxin/Furan) Test Data When Evaluating the Setting of MACT Floors Versus Establishing Work Practice Standards.* S. Johnson, U.S. EPA, Research Triangle Park, North Carolina. June 5, 2014.

Comment: A commenter stated the EPA's equating of hourly mercury test results with annual mercury rates and use of annual scrap usage to determine lbs of mercury per ton of scrap value is problematic for several reasons. The commenter stated that hourly mercury tests only account for the amount of mercury in the scrap at the time of the test and are not normalized for fluctuations in the short-term scrap usage rates, short-term scrap/iron ratios, or scrap and lime mercury concentration. The commenter asserted the differences in the mercury emissions rates between facilities and their respective operations are not appropriately accounted for in the EPA's calculations, based on the amount of scrap and mercury concentration in the scrap during the time of the test, which could add variability not properly factored into the EPA's calculations. The commenter stated it is inappropriate to assume that the type of scrap, scrap usage, and scrap-to-molten iron ratio at the time of the test were indicative of the long-term averages. Thus, the commenter stated, this critical element of the proposal's analysis is unjustified and cannot support standard-setting. In addition, the commenter stated that although the proposed standards in 40 CFR part 63, subpart FFFFF, Table 1 are intended to be set at the CAA section 112(d) floor level, they fail to account for the degree of variability present in steelmaking inputs and, thus, go beyond the floor without proper justification.

The commenter also stated the EPA's annualized approach (lbs/yr mercury ÷ ton scrap/yr) resulted in the skewness and kurtosis data analyses being represented as a lognormal distribution, whereas the output-based steel production approach (that accounts for short-term production rates) is skewed non-normal distribution, according to the prescribed MACT floor methodology. The commenter stated that since the mercury emissions data sets are the same between the two input- and output-based approaches, one could properly conclude that the annualized approach is not adequately accounting for the short-term production rate variability and, thus, it may be comparatively less representative of actual variability in mercury emissions during operations.

The commenter stated the EPA's analysis appears not to have accounted properly for the scrap mercury content variability and, thus, does not adequately apply the UPL concept of ensuring that sources controlled to the level of the best performing five sources would achieve the limit 99 percent of the time. The commenter stated that, as proposed, the UPL calculation does account for some degree of variability. However, the commenter stated the EPA needs to revisit the associated MACT floor calculations to better represent the variability among individual loads of scrap in terms of the variability in mercury content and the associated long-term emission performance in assessing the emission limit that is achieved by the top five performing sources or UPL.

The commenter asserted that the EPA should calculate the variability using all viable mercury emissions stack testing results in the UPL analysis and then apply that variability factor to the five best performing sources. Particularly when there is a small dataset for which the raw material content is indicative of emissions, the commenter asserted that the EPA needs to determine the variability that can reasonably be expected from the top performers. Given that the facilities in question were all accepting scrap from suppliers in the NVMSRP, the commenter said the variability in scrap obtained from such suppliers is reflected in all of the test results, not just the top five performers.

The commenter noted that in the NESHAP for the EAF source, which used similar scrap inputs as the Integrated Iron and Steel Manufacturing Facilities source category but at much greater volumes and proportions, the EPA recognized that an additional scrap variability factor would be needed to account for variation in mercury emissions if an emission limit was to be developed. Therefore, the commenter

stated, although the EPA did not ultimately establish a numeric mercury emission limit, working documents from development of the EAF rule show a ''scrap (mercury) variability'' factor was applied in an attempt to develop a mercury limit. The commenter stated that the EPA cited the variability of mercury in scrap metal as the reason why performance test averages varied by over 2 orders of magnitude at a single EAF plant. (72 FR 53817). The commenter stated that if the EPA decides to proceed, it needs to seek additional data regarding scrap mercury content and variability similar to the approach the EPA considered with the EAF NESHAP so that the UPL can account for that variability using standard and accepted methods.

The commenter stated rather than the approach the EPA took in the proposal of calculating the mercury per ton of scrap values by using a source's annual total scrap input tonnage, the EPA should refine its approach by comparing the scrap tonnage used in the individual heats when the ICR stack test results were obtained. Moreover, the commenter stated the EPA should look not only at the total scrap used for those heats, but also to the extent possible based on available records, the proportion of automotive shredded scrap used in those heats. The commenter stated this approach would be far more accurate than the one reflected in the proposal, which fails to account for any relation between the stack test data and the scrap used at the time those results were obtained. The commenter stated that failure to take this critical factor into account renders the standard not rationally related to the performance of the top performing sources and, thus, arbitrary and capricious.

Response: Because scrap varied from unit to unit and facility to facility, the variability in the scrap was already accounted for in the data used to develop the MACT floor. We used data for the mercury content of scrap from all units in the BOPF Group [13] at the top five best performing facilities from five locations in three states that stretched from Chicago, Illinois, to Pittsburgh, Pennsylvania. Over 100 runs of data were used to develop the facility lbs mercury/ton steel scrap values used to calculate the UPL. The variability in the scrap in the over 100 runs was almost certainly captured by the UPL calculation for the MACT floor.

In addition, the procedure the EPA uses to develop the MACT standards allows for variability in future emission measurements. To determine the MACT standard, an initially calculated UPL is compared to 3 times the HAP- and method-specific representative detection level (RDL) developed by the EPA, and the higher value is used as the MACT standard. This step ensures that the final MACT floor values will be measurable ADL values. (See Westlin and Merrill, 2011.[14])

As explained at the following website, a lognormal distribution is a type of skewed distribution (see *https://www.statisticshowto.datasciencecentral.com/lognormal-distribution/; https://www.investopedia.com/terms/s/skewness.asp*). A lognormal distribution leans toward the right because all values are above zero, by definition of a log. ''Skew'' refers to distortion or asymmetry as compared to a symmetrical bell curve, or normal distribution, in a set of data. If the curve leans towards the left or to the right, it is said to be skewed. Skewness can be quantified as a representation of the extent to which a given distribution varies from a normal distribution. A normal distribution has a skew of zero, while a lognormal distribution has some degree of right-skew. Both the input- and output-based approaches to calculate a mercury MACT limit are skewed because they are both lognormally distributed.

With regard to the mercury MACT calculations, when data from the same facilities were compared, the variability of the lbs mercury/ton scrap input dataset had more variability than the lbs mercury/ton steel output variability. Consequently, more variability is incorporated into the UPL calculation for the input-based standard than for an output-based.

Not every facility reported run-by-run scrap tonnage values to the EPA in the ICR, whereas every facility reported an annual scrap tonnage value. In addition, almost all facilities did not report percent automotive scrap use during testing or annually. Most facilities left this ICR answer field blank, said it was confidential, or was unknown. Therefore, the annual approach was the only option available to the EPA based on the data provided to the EPA by the integrated iron and steel facilities.

Comment: One commenter stated although the EPA's MACT floor calculation includes a mass concentration value for mercury content in lime, as is discussed in an attached engineering report providing independent evaluation by Barr Engineering Co. commissioned by AISI/U.S. Steel, the MACT floor calculation fails to account for potential mercury variability in lime inputs as the EPA has appropriately done in other contexts. The commenter stated this approach fails to account for variability in a manner that is appropriate for the source category.

Response: We agree with the commenter's Barr evaluation that some mercury emissions can be attributed to the other inputs to the BOPF, which include lime. However, the stack performance test data the EPA collected through the 2011 ICR would account for the lime portion of the mercury emissions and include some of the variability in emissions as well. Variability is accounted for both by the number and length of the source test runs and the fact that multiple sources were tested. Our MACT floor calculation relied on this data and, thus, accounted for variability in lime inputs. At this time, we do not have additional data regarding variability in lime inputs. The Barr evaluation cites the Portland Cement UPL calculation as an example of the EPA accounting for mercury variability in lime inputs in the UPL MACT floor calculation. The commenter pointed to the ''Intra-quarry Variability Estimate for Mercury'' memorandum for the Portland Cement NESHAP (40 CFR part 63, subpart LLL) memorandum (Docket ID item No. EPA–HQ–OAR–2002–0051–3323), and stated that, in that rulemaking, the EPA had 30 daily mercury concentrations, parts per million (ppm) in limestone by quarry values for three kilns that were in the MACT floor pool or used the same quarry as MACT floor pool kilns. The commenter also stated that those values were used to calculate temporal correlation between the quarries and calculate intra-quarry variability. That information, the commenter asserts, was then incorporated into the Portland Cement UPL MACT floor calculation. The commenter is correct that the EPA does not have direct data regarding mercury content of the lime used at the integrated iron and steel industry. For the integrated iron and steel ICR, facilities had to report the amount of lime used annually, but not the mercury content of that lime.

As shown in the memorandum titled *Mercury Emissions, Controls, and Costs at Integrated Iron and Steel Facilities* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0958), Table 4, the mercury from lime was estimated to comprise less than 15 percent of the total mercury inputs to the BOPF, on average. The value for mercury content of lime, at 0.03035 ppm, was developed from the average of data from two reference sources. One reference source was the information (Limestone Mercury Concentrations (ppb) with Revised Data from Buzzi. July 21, 2009) gathered for

the Portland Cement NESHAP (40 CFR part 63, subpart LLL; Docket ID Item No. EPA–HQ–OAR–2002–0051–3400) and the other source was from a Portland Cement Association research report (Hills and Stevenson, 2006; Docket ID Item No. EPA–HQ–OAR–2002–0083–0872).

The EPA estimated that mercury in the scrap accounts for over 85 percent of the total mercury inputs to the BOPF and constitutes the vast majority of mercury content; therefore, regulating the scrap input is sufficiently correlated to the numeric emission limitation for mercury to enable setting a standard for mercury from scrap. And, as noted above, as a result of the robustness of the mercury emission data used and the calculations performed to develop the MACT standard (UPL, etc.), we have accounted for the variability of mercury in both the scrap and lime. The mercury emission limitations are based on the best data available to the Agency and satisfies our obligation under CAA section 112(d) to establish a standard for mercury emissions from the BOPF. For information on the data used to develop the MACT floor, see the memorandum titled *Mercury Emissions, Controls, and Costs at Integrated Iron and Steel Facilities* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0958).

Comment: One commenter stated that with a small source category, and, thus, small number of sources setting the floor, a proper UPL analysis is essential to a technically defensible standard that is consistent with the statute. The commenter stated the EPA's technical memorandum regarding its mercury floor calculations acknowledges, however, that its dataset including just five data points is small and, in fact, below the minimum of seven data points that the EPA considers the threshold for a ''limited dataset.'' The commenter stated that this limited dataset is the result of calculating a mercury emissions per ton of steel scrap value for only the top five sources in the source category and then running the UPL calculation based only on those five sources.

Response: The BOPF Group existing source MACT floor pool dataset (five data points) is based on fewer than seven data points. Therefore, the EPA used the protocol for developing MACT floors for small datasets. (See technical memorandum titled *Mercury Emissions, Controls, and Costs at Integrated Iron and Steel Facilities* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0958)). For limited datasets, the EPA can further evaluate each individual dataset in order to ensure that the uncertainty associated with a limited dataset does not cause the calculated emission limit to be so high that it does not reflect the average performance of the units upon which the limit is based after accounting for variability in the emissions of those units. The EPA evaluated this specific integrated iron and steel mercury dataset to determine whether it is appropriate to make any modifications to the approach used to calculate MACT floors for each of these datasets. The EPA ensured that the selected data distribution best represents each dataset; ensured that the correct equation for the distribution was then applied to the data; and compared individual components of each limited dataset to determine if the standards based on limited datasets reasonably represent the performance of the units included in the dataset. Based on an evaluation of the limited datasets, the EPA determined that no changes to the standard floor calculation procedure were warranted.

For new sources, in the EPA's experience from the past, limited datasets warranted close scrutiny because sources with the lowest average emissions, but with a relatively high variance, could be identified mistakenly as the best performing source. In the mercury emission limit for new integrated iron and steel sources, the best performing source identified had 28 data points in the MACT floor pool, so it is not a limited dataset, nor does it have relatively high variance. Therefore, we conclude that further inspection of the existing emissions datasets is not warranted.

Comment: One commenter stated given the need to finalize this RTR in March 2020 and given that any data collection and analysis needed to generate a sound mercury emission limit would take at least a year, the EPA should not finalize the mercury emission limit at this time but instead should withdraw it and defer action to a later date to allow the EPA to address the flaws in the proposed standard. The commenter stated the proposed mercury emission limit should be withdrawn and, if the Agency ultimately determines a standard must be set, the EPA should issue a new, separate proposal because the changes necessary to both the dataset and the floor setting methodologies are sufficiently great that interested persons will need an opportunity to comment on the EPA's efforts to address them. In short, the commenter stated any mercury gap-filling should proceed on an independent track from the RTR, and it would be arbitrary and capricious for the EPA to finalize a mercury emission limit in reliance on the limited data it has and particularly using the flawed methodologies reflected in the proposal.

The commenter stated the EPA can and should determine that it currently lacks adequate data to establish a mercury emission limit, in light of the limited timeframe allowed under the judicial deadline to complete this rulemaking. The commenter stated such a decision would be afforded an ''extreme degree of deference'' by the Court on review. The commenter stated the EPA's obligation under the court order is to complete the RTR. The commenter stated filling a perceived gap in the original standard is not mandated under CAA section 112 generally and certainly is not compelled to be part of the RTR. Accordingly, the commenter stated the EPA need not finalize the mercury proposal by the March 2020 RTR deadline. The commenter stated if the EPA promulgates now, the standard will necessarily lack adequate data and a record to support it and, thus, would not only be ill-advised, but also arbitrary and capricious.

Response: The EPA opted to promulgate these mercury emission limits at the same time we conducted the RTR in part to address an outstanding petition for reconsideration asking the Agency to set a mercury emissions standard. The data used for the mercury emission limit were stack test data obtained using typical mercury testing methodology and the procedures we followed to develop the MACT limits were typical MACT standard development procedures. The mercury data are not flawed, as explained elsewhere in this preamble in responses to commenters' specific allegations. All alleged flaws have been addressed above in responses to comments received, and we have shown that the allegations were unfounded and/or lacking scientific basis and that the EPA data and data handling procedures were performed correctly to develop the numeric emission limitation. Thus, we did not make any changes to the mercury emission limit in response to comments received. The mercury emission limitation promulgated in this rule is based on the best data available to the Agency and satisfies our obligation under CAA section 112(d) to establish a standard for mercury emissions from the BOPF.

Comment: One commenter stated if the EPA proceeds with a mercury emission limit, the proposal to allow facilities to satisfy the mercury requirements by certifying that their scrap is ''not likely to contain motor vehicle scrap'' in the proposed rule, *e.g.,* proposed 40 CFR 63.7791(b) (final 40 CFR 63.7791(d)), is reasonable but needs

to be revised to better match the requirements in 40 CFR 63.10685(b) in 40 CFR part 63, subpart YYYYY. For example, the commenter stated the EPA needs to clarify that the option applies to ''scrap not likely to contain automotive *shredded* scrap,'' rather than all ''motor vehicle scrap'' as it is currently proposed; regulatory language changes should be made to reflect this clarification. This is because mercury switches, the commenter stated, the driver of mercury emissions, are not present in all motor vehicle scrap; rather, mercury switches are typically only present in *shredded* automotive scrap. The commenter stated facilities should, thus, be able to comply by certifying that scrap inputs are not likely to contain automotive shredded scrap. The commenter recommended the EPA modify proposed 40 CFR 63.7791(a)(1), 63.7791(a)(2), 63.7791(b)(1), 63.7791(b)(2), 63.7791(c), 63.7840(f)(1), and 63.7852 (final 40 CFR 63.7791(c)(1), 63.7791(c)(2), 63.7791(d)(1) through (d)(3), 63.7791(e), 63.7840(f)(1), and 63.7852, respectively) definitions for motor vehicle scrap, scrap provider, and steel scrap accordingly.

Response: The EPA acknowledges the clarification requested by the commenter and has incorporated these suggestions as much as appropriate into the final rule. We agree with the commenter that given today's automobile fleet, where motor vehicles from 2003 production and earlier still contain mercury switches, the scrap containing mercury switches is typically shredded automotive scrap. We have revised the proposed option that would have allowed facilities to comply by certifying that the facility's scrap is ''not likely to contain motor vehicle scrap.'' As finalized, this option has been changed to allow facilities to comply by certifying that the facility's scrap ''does not contain mercury switches.'' This approach allows facilities to establish the absence of mercury switches in their scrap, as appropriate for their facility, *i.e.,* their scrap is recovered for its specialty alloy content, their scrap does not contain motor vehicle scrap, or their scrap does not contain shredded motor vehicle scrap.

Comment: One commenter stated facilities that use small amounts of automotive shredded scrap relative to other inputs per ton of steel produced, even from non-NVMSRP suppliers, would not be expected to emit mercury at levels exceeding the emission limitations reflected in the proposed rule. As the proposal acknowledges, the commenter stated that the mercury content associated with mercury switches in older, end-of-life vehicles is the basis for the mercury emission limit. The commenter stated mercury switches are not present in all scrap, and not even in all automotive scrap; rather, mercury switches are only potentially present in shredded automotive scrap. Because of this, the commenter stated, facilities using small amounts of automotive shredded scrap would not be expected to have mercury emissions in excess of the proposed standard. Thus, the commenter stated, sources using minimal amounts of automotive shredded scrap should not be burdened with the costs of testing or documenting participation in the switch recovery programs, particularly given the low risk modeled for the source category.

The commenter stated the EPA should modify the proposed 40 CFR 63.7791(b) to allow facilities to instead certify that they use only minimal amounts of automotive shredded scrap inputs, such as 10-percent automotive shredded scrap per ton of steel produced. So long as a facility does not use more automotive shredded scrap than the threshold, the commenter stated that certification should constitute its compliance demonstration; this would enable facilities that use very minimal amounts of automotive shredded scrap or that use automotive shredded scrap only occasionally based on the scrap supply market, and are, thus, unlikely to exceed the mercury emission limit, to be deemed compliant, as well.

The commenter added the EPA should acknowledge that when the NVMSRP ends this event will, in essence, establish compliance with the proposed mercury emission limit because it will signal achievement of substantial elimination of mercury switches from automotive scrap. Consistent with the compliance option for the proposed mercury requirements of allowing purchase of scrap from NVMSRP participants, the commenter stated the EPA should include in any final rule a provision that when the NVMSRP ends, sources would be deemed compliant with the mercury emission limit (because the commenter stated the EPA would have deemed that the NVMSRP is no longer needed to reduce mercury switches from automotive scrap).

The commenter stated the EPA should revise proposed 40 CFR 63.7791(c) or add a new 40 CFR 63.7791(d) to allow sources to otherwise show that their shredded motor vehicle scrap is unlikely to contain mercury. For example, the commenter stated, if the NVMSRP has ended with a finding that the mercury switches remaining in vehicles on the road are minimal, the fact that there is no need for such a program establishes the diminished presence of mercury. Or, the commenter stated, if a scrap dealer uses only recycled post-2003 vehicles, the use of this automotive scrap should not contain any appreciable mercury. In other words, the commenter stated, at some point the number of recycled vehicles containing mercury switches will diminish to the extent that mercury in automotive scrap is no longer a concern. At this point, the commenter stated, facilities should be able to rely on some provision in 40 CFR 63.7791 to conclude that their scrap is unlikely to contain mercury switches. The commenter stated such an approach is reasonable because the standard is driven by the use of automotive shredded scrap at BOPF shops and the mercury content in that scrap, and the NVMSRP is aimed at removing mercury switches from automotive shredded scrap. The commenter stated meeting the NVMSRP's program goals, which should be the rationale for ending the program, will occur when mercury switches are sufficiently removed from automotive scrap. When that has occurred, the commenter stated, it will mean that the remaining automotive scrap inputs available to integrated iron and steel facilities will in effect satisfy the NVMSRP criteria, and facilities should be considered to be in compliance with the mercury emissions standard. In that case, the commenter stated, it would not add value to require further compliance with the administrative burdens associated with complying with the standard, since the source will have been effectively eliminated.

Response: The commenter appears to be asking the EPA to create an exemption from the requirements for certain sources and to not regulate the mercury emissions from those sources. In other words, the commenter is asking the EPA to read a de minimis exemption into the requirement that the EPA regulate all HAP emitted by major sources. The court, however, has previously upheld the EPA's rejection of this argument on the grounds that the statute does not provide for de minimis exemptions where a MACT floor exists. *See Nat'l Lime Assn.* v. *EPA,* 233 F.3d 625, 640 (D.C. Cir. 2000). For this reason, the EPA is not making any changes to the proposed rule to create an exemption for de minimis mercury emissions as per this comment.

However, in the final rule, the compliance option in 40 CFR 63.7791(d) ''*Use of scrap that does not contain mercury switches*'' can be used by a source if the facility can establish that

their scrap does not include mercury switches. This option is available regardless of whether or not the NVMSRP is in operation. If the NVMSRP were to be discontinued, however, the fact that the program had been discontinued would not establish the mercury level, or lack thereof, in the scrap. Thus, the potential scenario of NVMSRP discontinuation could not be relied upon to demonstrate compliance with the mercury emission limit.

Comment: One commenter stated the proposed standards for the integrated iron and steel source category are very similar to the requirements for facilities in the EAF area source standards to obtain scrap from participants in the NVMSRP and therefore the EPA should reconcile this rule with the EAF rule. The commenter stated the rule language should be revised to maintain consistency with the existing EAF NVMSRP regulatory language.

As background, the commenter explained that some companies with facilities subject to the subpart FFFFF standards for integrated iron and steel sources also operate EAF facilities subject to the subpart YYYYY standards, and they purchase and manage scrap that is charged both into BOPF vessels and the EAF at a corporate level, using the same policies and management methods to obtain scrap for both source categories. Since these companies have area source EAF facilities that must comply with the mercury switch program requirements in subpart YYYYY, the commenter stated their entire scrap management system is already compliant with the motor vehicle scrap management requirements in those standards. The commenter stated the language differences between subpart YYYYY and the proposed subpart FFFFF motor vehicle scrap management requirements could cause issues in managing these companies' scrap supply chains and ensuring compliance with both regulations. The commenter stated the proposal does not explain why these differently worded requirements are being imposed on integrated iron and steel facilities, particularly given that EAF sources use a greater proportion of scrap inputs than integrated iron and steel BOPF sources and that doing so would impose burdens on facilities, including the need to modify contracts and additional administrative costs. Because of the identical supply chain for BOPF shops and EAFs, the commenter stated there should be no differentiation in the requirements. The commenter suggested revisions to the proposed language 40 CFR 63.7791(b) (final 40 CFR 63.7791(d)) and to add allowance for specialty metal scrap from motor vehicles.

Response: The EPA agrees with the rationale for the suggested changes and we have made revisions to the rule to make this rule more similar to 40 CFR part 63, subpart YYYYY, as described below in section IV.C.5. In terms of NVMSRP participation, the proposed rule was identical to subpart YYYYY except for the scrap plan requirement; we have removed the scrap plan requirement in the final rule. As discussed above in a previous comment, in the final rule, we have revised the proposed option that allowed sources to comply by certifying that the facility's scrap is ''not likely to contain motor vehicle scrap.'' As finalized, the facility can establish compliance with the mercury emission limit by certifying the absence of mercury switches in their scrap, as appropriate for their facility: By either certifying that their scrap is recovered for its specialty alloy content, or their scrap does not contain motor vehicle scrap, or their scrap does not contain shredded motor vehicle scrap.

Comment: One commenter stated the proposed annual testing for sources opting to comply under subpart FFFFF Table 1 should be revised to once per five-year title V permit term, which is consistent with frequencies for other title V testing requirements for the sources, such as for secondary BOPF baghouses. The commenter stated more frequent testing is unnecessary given that emissions are steadily declining among the source category in conjunction with the depletion of mercury switches in automotive scrap. If the EPA believes that more frequent than once-per-term testing is needed, the commenter stated EPA then should adopt a twice per five-year permit term, similar to the testing frequency for primary BOPF controls, given the high cost of testing. The commenter stated requiring annual testing would be excessive, costly, without basis, and inconsistent with any other requirements in the subpart FFFFF standards. In the event that EPA retains the annual testing requirement, the commenter stated revisions to the proposed language regarding time between performance tests should be made to clarify the point at which facilities should begin to calculate these dates.

Response: The EPA agrees with a reduction in testing frequency to coincide with tests for PM already promulgated in the rule (40 CFR 63.7821(b)) for units equipped with control devices other than a baghouse (which includes all of the primary BOPF control devices), which will reduce the testing burden on the industry. The change is as follows (for testing compliance option, only): Change from annual testing to twice per permit cycle (initial/final and mid-term) for facilities with title V permits, and every 2.5 years for facilities without a title V permit, to match the PM testing frequency in 40 CFR 63.7821. Testing would then take place after the initial performance test at the next specified point in the permit cycle, either at initial, final, or mid-term of the permit (for facilities with permits), whichever comes first after the initial performance test, which is one year after the effective date of the rule, or within 2.5 years after promulgation (for facilities without permits).

Comment: One commenter stated in any final rule, and consistent with the approach the EPA took in the ICR testing, the EPA should explicitly provide for similar units at a source to rely on the testing of one of those units for subpart FFFFF Table 1 compliance demonstration purposes, where the units are exhausted to the same type of control device, processed the same types of materials, were similar size and design, and have similar operating conditions.

Response: We understand the economic benefit associated with reducing the testing burden where possible. The EPA allows testing of representative units on a case-by-case basis as described in the 2009 EPA guidance document, *Clean Air Act National Stack Test Guidance,*[16] pursuant to the EPA's authority cited in the General Provisions to part 63 at 40 CFR 63.7(h). Similar to the requirements to establish similarity that was used in the integrated iron and steel ICR for this RTR, the stack test guidance requires submission of design and operating parameters to establish the case of identical units, as described further in the guidance, with the final decision to be determined by the Administrator or delegated authority. The EPA thus provides options for reducing testing burden and no addition to or modification of the rule is needed to provide this testing option.

Comment: One commenter stated the proposed 40 CFR 63.7825(a)(2) provision requires either a single compliance test with all affected units in operation or separate compliance tests on each emission unit in the BOPF Group. The commenter stated most facilities have multiple stacks that

[16] *Clean Air Act National Stack Test Guidance.* U.S. Environmental Protection Agency, Washington, DC. April 27, 2009. (Docket ID Item No. EPA–HQ–OAR–2002–0061). *https://www.epa.gov/sites/production/files/2013-09/documents/stacktesting_1.pdf.*

would need to be tested under the current Proposed Rule; simultaneously testing all stacks during a single compliance testing event would be difficult or impossible. The commenter stated this leaves the option of performing separate compliance testing on each emission unit. The commenter stated proposed 40 CFR 63.7825(a)(2) requires that when units are tested separately, they must be tested ''as soon as is practicable,'' which is not defined. The commenter stated the EPA should allow a three-month period for all stacks to be tested. To implement this, the commenter stated the EPA should create a new subparagraph, *e.g.,* 63.7825(a)(3), as follows: ''Testing of related BOPF Group units shall be conducted within a 3-month period.''

The commenter stated since the BOPF Group mercury limit applies to all BOPF shop steelmaking operation units, the compliance demonstration for performance testing requires mercury emissions from all BOPF Group stacks to be added up to demonstrate compliance. The commenter stated this calculation cannot be made until all BOPF Group sources have been tested. Under proposed 40 CFR 63.7840(e)(2), the commenter stated facilities are required to submit a notification of compliance status within 60 days of completion of the performance test. The commenter requested that EPA allow for one notification of compliance status to be submitted 60 days after the final performance test. The commenter also stated that in the proposal, facilities are required to provide a 60-day notification of intent to conduct performance testing. Therefore, the commenter requested that the rule also provide that the 60-day notice be submitted at least 60 days prior to the first BOPF Group unit control device test; then the initial testing notification can be required to include a schedule of when testing of other BOPF Group unit control devices will be tested, rather than require additional notification for subsequently tested sources.

Response: The EPA has decided that it is not appropriate to allow a three-month window for testing because this time period likely would include very different batches of scrap and possibly wide variation in levels of mercury. However, we discuss in the previous comment and response that EPA provides for facilities to be able to apply for a waiver of testing in the case of multiple and identical units via stack test guidance [16] pursuant to EPA's authority in 40 CFR 63.7(h). For the final rule, the EPA changed the requirement for a 60-day notification of the start of ''mercury compliance testing'' to ''notification of the first compliance test in the BOPF Group with a schedule of all subsequent tests in the BOPF Group.'' The final rule also differs from the proposed rule in that it states that ''for the purposes of submitting the notification of compliance status, the performance test shall be considered complete when the final BOPF Group unit control device is tested.'' These changes eliminate multiple start notices for testing of the BOPF Group and clarify that only one notice of compliance status is needed to show compliance with the mercury emission limit. Because all units in the BOPF Group must be tested before the mercury emissions can be calculated and compared to the emission limit in the rule, it is logical to require one notice of compliance status after the last BOPF Group unit is tested. See section IV.C.5 below for details of the rule changes.

Comment: One commenter stated mercury testing samples were collected during the ICR process following sampling procedures in 40 CFR 63.7822(f), (g), and (h), which dictate when sampling begins and ends during specific process BOPF operations for PM testing. The commenter stated the same procedures should apply to mercury testing and should be incorporated by reference in the mercury testing requirements. Accordingly, the commenter stated proposed 40 CFR 63.7825 should be modified to include the procedures in 40 CFR 63.7822(f), (g), and (h) as applicable.

Response: The EPA agrees that mercury testing samples were collected during the ICR process following sampling procedures in 40 CFR 63.7822(f), (g), and (h). Therefore, we have added these procedures to the final rule. See section IV.C.5 for details of the rule changes.

Comment: One commenter stated the 40 CFR 63.7825(b)(2) provision requires a minimum sample volume of 60 dscf of gas during each mercury test run. The commenter stated it is inappropriate to collect 60 dscf when using EPA Method 30B because the method itself contains guidelines for selecting proper sampling rates. The commenter stated the collection of 60 dscf should be clarified to only apply to EPA Method 29 or other isokinetic sampling methods.

Response: We agree with the commenter that EPA Method 30B has a method-specific volume requirement tied to the detection limit of the method, so we do not need to identify a minimum volume for EPA Method 30B in the rule. However, a sample volume of 60 dscf is appropriate for EPA Method 29. The rule text has been revised to specify that the 60 dscf minimum sample volume applies to Method 29 only. See section IV.C.5 for details of the rule changes.

Comment: One commenter stated the EPA should also include EPA Method 101A, *Determination of Particulate and Gaseous Mercury Emissions From Sewage Sludge Incinerators,* which is a viable alternative to both EPA Methods 29 and 30B.

Response: The EPA does not consider EPA Method 101A to be equivalent to EPA Method 29 for mercury measurement for all purposes. However, the EPA is willing to consider EPA Method 101A as an alternative test method under the General Provisions to 40 CFR part 63 (40 CFR 63.7(f)) on a case-by-case basis, provided the petitioner can provide adequate information demonstrating that this candidate method is equivalent to the standards (*i.e.,* EPA Methods 29 and/or 30B). The proposed rule text has been revised to elaborate on EPA's ability to allow alternative test methods to be considered on a case-by-case basis. See section IV.C.5 for details of the rule changes.

Comment: One commenter stated in order to use the NVMSRP or equivalent program option, the EPA lists in proposed 40 CFR 63.7791(a) and (c) a host of requirements that companies will need to meet. The commenter stated a key purpose of the NVMSRP was to have suppliers register and participate so that companies could rely on that participation to prevent mercury from entering their feedstocks in the form of automotive shredded scrap. The commenter stated since its initiation, the NVMSRP has proven to be a success. As recognition of that success, in 2017, the commenter stated that the EPA, along with the original parties to the 2006 agreement, came together to extend the program through 2021. The commenter stated unfortunately, the proposed language fails to recognize that the industry has substantially invested to make the program a success and instead would put individual companies in the role of policing the program. The commenter stated companies need to be able to rely on the program and that its suppliers are participants therein. The commenter stated nothing more should be required.

The commenter said specifically that the EPA should delete 40 CFR 63.7791(a)(3)–(5) and (c)(3)–(5). The commenter stated these provisions are inconsistent with the requirements that apply to the NVMSRP as it is considered an ''approved mercury program'' in 40 CFR 63.10685 in 40 CFR part 63,

subpart YYYYY. The commenter stated companies are not in a position to renegotiate supplier contracts to allow them to enter and inspect suppliers. Moreover, the commenter stated the EPA is unclear about what ''other corroboration'' even means in the context of the program; the participation of the suppliers in the program should be sufficient. Finally, the commenter stated any broker contracts would provide that the scrap needs to be from NVMSRP-participating suppliers and it is entirely unclear how the EPA expects companies to ensure that suppliers are ''implementing appropriate steps to minimize the presence of mercury in scrap from end-of-life vehicles.'' The commenter stated that this assurance is implicitly made by contracting for scrap from suppliers participating in the program.

The commenter stated while the EPA correctly states that companies are already participating in the NVMSRP, the requirements in the proposed rule take the verification process to a more burdensome level, which will impose significant additional costs. The commenter stated creating the plans required in the proposed rule is likely to far exceed the proposed approximate $1,000 estimate, given the labor and supervision required, not to mention ongoing plan updates. Moreover, the commenter stated the proposed cost estimate entirely excludes consideration of the massive costs that would be required to satisfy the due diligence obligations the proposed regulatory language would create. For example, according to the commenter, the proposed requirement to ''conduct periodic inspections or provide other means of corroboration to ensure that scrap providers and brokers are aware of the need for and are implementing appropriate steps to minimize the presence of mercury in scrap from end-of-life vehicles'' would impose an obligation on integrated iron and steel facilities that would be both onerous and expensive. The commenter stated it also would be potentially impossible to satisfy because existing contracts are in place that do not provide authority for the purchaser to inspect suppliers or otherwise ensure *their* ''appropriate'' implementation of mercury removal practices. If the plan is not removed, and a mercury emission limit is issued, the commenter said the EPA should revise the cost-effectiveness analysis to better account for the costs of the NVMSRP (or equivalent) program. Specifically, the commenter stated the proposal needs to better account for the cost of the NVMSRP option, which is estimated at $1,058 per facility and $11,638 across the industry, with similar costs assumed for certifying compliance not likely to contain automotive scrap.

The commenter stated instead of these requirements, as explained above, the EPA should simply require that the company to purchase from suppliers that state they are participating in the NVMSRP (which may be reflected on invoices or in contracts). The commenter stated additional obligations need not be imposed because the EPA's record for this rulemaking establishes that the NVMSRP is an effective program for removing mercury switches from shredded automobile scrap. The commenter stated the EPA can reasonably rely on that record.

The commenter stated similarly, just as the NVMSRP is an EPA approved program, any alternative ''approved mercury program'' contemplated in the proposal would have the same level of approval as the NVMSRP, and integrated iron and steel facilities should be able to rely on the stipulation in contracts with their scrap suppliers that any shredded automotive scrap received is from NVMSRP or similar EPA-approved program participants and is compliant with the program's standards.

Response: The EPA has considered the commenter's request and rationale, and has eliminated the proposed plan requirement in the final rule and instead is requiring facilities to both identify their scrap dealers or brokers and certify that these dealers and brokers participate in the NVMSRP or other EPA-approved program. See section IV.C.5 of this preamble for details of the rule changes.

Comment: One commenter stated the EPA proposes to require compliance with the proposed mercury emission limits within 1 year of publication of the final rule, and that all other amendments to the 40 CFR part 63, subpart FFFFF standards will become effective 180 days after publication of the final rule. The commenter stated these proposed compliance dates are inadequate to allow facilities to undertake all the necessary planning and operational adjustments needed to ensure compliance with the Proposed Rule. The commenter stated the EPA should not proceed to finalize the proposed mercury provisions with this RTR rulemaking, however, if the Agency proceeds to do so nonetheless, the EPA must provide a 3-year compliance period to allow facilities to comply. The commenter stated because the proposed mercury requirement constitutes new standard setting under CAA sections 112(d)(2) and (3), more time is needed for facilities to ensure compliance. The commenter stated the remaining proposed amendments to the 40 CFR part 63, subpart FFFFF standards will likewise require additional time for facilities to conform their existing practices. The commenter stated the EPA should, thus, extend the proposed effective date of 180 days after promulgation of the final rule to 1 year after that date.

Response: It is our understanding that all facilities are already participating in the NVMSRP and facilities have the option of complying with the mercury emission limit by certifying that all their scrap is from NVMSRP participants (or a similarly-approved program). Further, we determined 1 year after promulgation is sufficient for facilities to familiarize themselves with the new reporting requirements in the amended rule for this compliance option. For these reasons, we have concluded that it is reasonable to require existing sources to comply with the mercury requirements within 1 year. Existing sources will be given 180 days to comply with the changes to the SSM provisions in 40 CFR part 63, subpart FFFFF and all other new or revised requirements in this final rule, except the requirements for mercury. We have determined that there are no other compliance requirements as a result of this rule that require more than 180 days except for those for complying with the mercury emission limit and potentially for electronic reporting. Regarding the electronic reporting requirement, because we are revising the spreadsheet template for integrated iron and steel facilities as a result of comments discussed in section IV.E of this preamble, we are allowing the beginning of electronic reporting of compliance reports to begin 180 days after the new template is available in CEDRI if later than 180 days after promulgation of the final rule.

4. What is the rationale for our final approach for the mercury emission limits?

The mercury MACT limit for existing sources (*i.e.,* 0.00026 lbs of mercury per ton of scrap processed, as an input-based limit) was derived using data obtained from source tests performed to fulfill an EPA ICR to determine the mass of mercury emissions from the BOPF Groups [13] at each facility per mass of scrap used in their BOPFs. The format of this standard is based, in part, on the assumption that the mass of mercury emitted from all BOPFs and related units was substantially equivalent to the mass of mercury in the input materials

because mercury is neither created nor destroyed in the BOPF. Furthermore, based on available data and information, we conclude that the primary source of mercury in the input materials are mercury switches. Therefore, we used mercury-to-scrap input ratios from the best performing five facilities out of all 11 integrated iron and steel facilities in the Integrated Iron and Steel Manufacturing Facilities source category to develop an input-based MACT floor limit for mercury. To establish the limit, we calculated a UPL that incorporates the potential variability in future measurements. Because there are fewer than 30 sources in the Integrated Iron and Steel Manufacturing Facilities source category, as described below, we evaluated the best performing five sources in the category to establish a standard for existing sources, pursuant to CAA section 112(d)(3)(B).

The EPA's MACT analyses used the UPL approach to identify the average emission limitation achieved by the best performing five sources. The EPA uses this approach because it incorporates the average performance of the best performing sources as well as the variability of the performance during testing conditions. The UPL represents the value which one can expect the mean of a specified number of future observations (*e.g.,* three-run average) to fall below for the specified level of confidence (99 percent), based upon the results from the same population. In other words, the UPL estimates what the upper bound of future values will be based upon present or past background data. The UPL approach encompasses all the data point-to-data point variability in the collected data, as derived from the dataset to which it is applied. For more details regarding how this limit was derived, see the technical memorandum on the mercury emission limits, referenced above.

The steel industry submitted comments [15] on the proposed rule indicating that the scrap currently used by all facilities is NVMSRP scrap. Furthermore, industry stated [15] that the performance tests conducted to establish the MACT floor limits and, thus, the MACT for mercury in the proposal were based on facilities participating in the NVMSRP. Because of the projected decline in the number of mercury switches in the automobile fleet over time due to the ban of such switches after 2002, and with the continuing implementation of the NVMSRP, it is reasonable for the EPA to conclude that NVMSRP scrap in the future will contain similar mercury, or more likely less mercury, than the scrap used to develop the MACT floor limits. This rule relies, in part, on that conclusion. Therefore, if a facility chooses to comply with the emission limit by certifying that all their scrap is from NVMSRP participants (or a similarly-approved program) or certify that their scrap does not contain mercury switches, it is also reasonable to conclude that such certification achieves the same level of mercury reduction or more reduction as the numeric MACT floor limits.

The mercury emission limit for new sources in the final rule, at 0.000081 lbs of mercury per ton of scrap processed, was derived using ICR test data of the mass of mercury emissions from all BOPF and related units (HMTDS and ladles) per mass of scrap used by the lowest-emitting facility, pursuant to CAA section 112(d)(3). For the final rule, we are correcting the mercury limit from proposal to include two significant figures, from 0.00008 to 0.000081 lbs of mercury per ton of scrap processed, as in the standard for existing sources and as typically done in EPA regulations.

Following the same reasoning discussed above in connection with the existing source standard, we assumed and industry confirmed [15] that the scrap used by the best performing source was either NVMSRP scrap or scrap with higher amounts of mercury per ton of scrap than NVMSRP scrap. Furthermore, industry stated [15] that the performance tests conducted to establish the MACT floor limits and, thus, the MACT for mercury in the proposal were based on facilities participating in the NVMSRP.

As described above, we expect mercury levels in scrap to continue to decline over time due to the switch ban and success of the NVMSRP. Therefore, it is reasonable for the EPA to conclude that scrap subject to the NVMSRP or other approved scrap program in the future will contain similar levels of mercury or, more likely, less mercury than the scrap used to develop the new source limit. Because mercury levels in scrap in the NVMSRP have decreased since 2011 and continue to decrease, it is reasonable to assume that mercury emissions from sources that obtain their metal scrap from participants of that program (or similar program) will be equal to, or more likely lower than, the MACT floor limits for both new and existing sources.

Similar to existing sources above, for new BOPFs and new facilities, we are finalizing provisions in the NESHAP that allow two options to demonstrate compliance with the input-based limit of 0.000081 lbs of mercury per ton of scrap processed, as follows: (1) Conduct performance test twice per permit cycle, *i.e.,* mid-term and at initial or end term for facilities with permits or every 2.5 years for facilities without permits, after the initial performance testing, which is required to be performed within 180 days of July 13, 2020 or within 180 days of initial startup of the new BOPF or new facility, whichever is later, convert the sum of the results to input-based units (*i.e.,* lbs of mercury per ton of scrap input) and document the results in a test report created using the ERT and submitted electronically to the delegated authority through CEDRI (see section IV.E below); or (2) certify in their semiannual compliance reports, with the first semiannual compliance report required after July 13, 2021 or after initial startup of your BOPF Group, whichever is later, that the facility obtains all of their scrap from NVMSRP participants (or similar program as approved by the delegated authority) or certify that their scrap does not contain mercury switches. However, based on consideration of comments, in this final rule the EPA has eliminated the proposed requirement to develop and maintain onsite a scrap plan demonstrating the manner through which facilities are participating in the NVMSRP or similar approved program. Facilities complying via the performance testing option and facilities complying via the NVMSRP or similarly-approved program, or facilities that use scrap that does not contain mercury switches will have 1 year to comply. New facilities must be in compliance with the rule upon startup.

5. What rule changes did we make to the final rule for the mercury emissions standards from proposal?

In response to comments submitted in regard to the proposed mercury emissions standards, we made the following changes for the final rule:

- Added 40 CFR 63.7783(f) to establish the deadline for existing and new affected sources to comply with the emission limitations for mercury;
- Revised proposed 40 CFR 63.7791 title to ''How do I comply with the requirements for the control of mercury?'';
- Revised proposed 40 CFR 63.7791 opening paragraph to start with the letter (a); renamed ''Compliance deadlines''; created new subsections 40 CFR 63.7791(a)(1), 63.7791(a)(2), 63.7791(b)(1) through (3); re-lettered the subsections that followed: 63.7791(c)(1) through (4); 63.7791(d)(1) through (3); and 63.7791(e)(1) through (4); and updated citations throughout the remaining rule text to reflect new organization;

• Revised 40 CFR 63.7791(c)(2) (proposed as (a)(2)) to specify the notification of compliance requirement to identify all scrap providers in semiannual compliance report;
• Revised 40 CFR 63.7791(c)(3) (proposed as (a)(3)) to specify the requirement to identify all scrap providers used by all scrap brokers in semiannual compliance report;
• Removed proposed 40 CFR 63.7791 (a)(4) scrap plan requirement to develop and maintain onsite plan demonstrating the manner through which facilities are participating in the NVMSRP (or other EPA-approved program);
• Revised 40 CFR 63.7791(d) (proposed as (b)(1)) to delete the scrap plan features to obtain information from scrap suppliers or other entities with established knowledge of scrap content that the steel scrap used is not likely to contain motor vehicle scrap and maintain records of this information, and reassigning proposed 40 CFR 63.7791(b)(2) as new, revised 40 CFR 63.7791(d);
• Added 40 CFR 63.7791(d)(1) through (3) regarding compliance by certification of the use of scrap that does not contain mercury switches or is recovered for the specialty alloy content;
• Removed proposed 40 CFR 63.7791 (c)(1)(i) through (iii), limitations on future approved programs;
• Revised 40 CFR 63.7791(e)(2) (proposed as (c)(2)) to specify the notification of compliance requirement to identify all scrap providers in semiannual compliance report;
• Revised 40 CFR 63.7791(e)(3) (proposed as (c)(3)) to specify the requirement to identify all scrap providers used by all scrap brokers in semiannual compliance report;
• Removed proposed 40 CFR 63.7791(c)(4) scrap plan requirement to prevent limitations on future approved plan, and reassigned proposed 40 CFR 63.7791(c)(5) as new, revised 40 CFR 63.7791(e)(4);
• Added 40 CFR 63.7820(e)(1) through (4) to establish the deadlines for conducting initial performance tests to demonstrate compliance with the mercury emission limitations;
• Added and revised 40 CFR 63.7821(e) to require performance tests to be conducted twice per permit cycle for sources with title V operating permits and every 2.5 years for sources without a title V operating permit;
• Added 40 CFR 63.7825 for test methods and other procedures to demonstrate initial compliance with the emission limit for mercury;
• Revised 40 CFR 63.7825(a) to clarify that initial compliance tests must be conducted by the deadlines in 40 CFR 63.7820;
• Revised 40 CFR 63.7825(b)(1)(v) to clarify that the minimum sample volume of 1.7 dry standard cubic meters (dscm) (60 dry standard cubic feet (dscf)) is for EPA Method 29 only and to clarify alternative test methods can be considered on a case-by-case basis per 40 CFR 63.7(f);
• Revised 40 CFR 63.7825(b)(2) to remove requirement of minimum sample volume of 1.7 dscm (60 dscf);
• Added to 40 CFR 63.7825(b)(3), (b)(4)(i), (b)(4)(ii), and (b)(5) to make sampling procedures consistent with 40 CFR 63.7822(f), (g), and (h) in regard to when sampling should start and stop for BOPF operations;
• Revised 40 CFR 63.7825(c) Equation 1 to correctly calculate the mass emissions and revised units to those typically used in the measurement of metals;
• Revised 40 CFR 63.7833(h) to clarify requirements for demonstrating compliance with the mercury emission limits in Table 1 through mercury performance testing;
• Revised 40 CFR 63.7833(i) to clarify requirement for demonstrating compliance with the mercury emission limits in Table 1 by certifying participation in the NVMSRP or another EPA-approved mercury program, or by using scrap that does not contain mercury switches;
• Revised 40 CFR 63.7840(e) requirement for notification of mercury compliance testing for BOPF Group units to include notification of the first mercury compliance test in the BOPF Group along with a schedule of all subsequent tests in the BOPF Group, and that testing is considered complete when the final unit or control device in the BOPF Group is tested;
• Revised 40 CFR 63.7840(f) to include citation to 40 CFR 63.7791(c), (d), and (e) (proposed as (a), (b), and (c));
• Revised 40 CFR 63.7840(f)(1) to remove requirements regarding preparing a plan per proposed 40 CFR 63.7791 (a)(4) or (c)(4);
• Added 40 CFR 63.7841(b)(11) to clarify the reporting statements required per 40 CFR 63.7791(c), (d) or (e);
• Revised 40 CFR 63.7852 to add or change definitions for ''basic oxygen process furnace group,'' ''mercury switch,'' ''motor vehicle,'' ''motor vehicle scrap,'' ''opening,'' ''post-consumer steel scrap,'' ''pre-consumer steel scrap,'' ''steel scrap,'' ''scrap provider;'' ''shredded motor vehicle scrap,'' and ''specialty metal scrap;'' and
• Revised the mercury emission limits in Tables 1, 2, and 3 from 0.00008 to 0.000081 lbs of mercury per ton of scrap processed to include two significant figures.

D. Changes to SSM Provisions

1. What did we propose for SSM?

On August 16, 2019, we proposed to eliminate the SSM exemption in this rule which appears at 40 CFR 63.7810(a). We also proposed to revise the references in Table 4 (the General Provisions table) of 40 CFR part 63, subpart FFFFF, including the references to 40 CFR 63.6(f)(1) and (h)(1), which were vacated by the Court in *Sierra Club* v. *EPA,* 551 F. 3d 1019 (D.C. Cir. 2008). Consistent with *Sierra Club* v. *EPA,* we proposed that the standards in this rule would apply at all times. We also proposed several additional revisions to Table 4 of 40 CFR part 63, subpart FFFFF. For example, we proposed to eliminate the incorporation of the General Provisions' requirement that the source develop an SSM plan. We also proposed to eliminate or revise certain recordkeeping and reporting requirements related to the SSM exemption. We aimed to ensure that the provisions we proposed to eliminate were inappropriate, unnecessary, or redundant in the absence of the SSM exemption.

2. How did the SSM provisions change for the Integrated Iron and Steel Manufacturing Facilities source category?

We did not make any major changes to the proposed SSM provisions for the Integrated Iron and Steel Manufacturing Facilities source category. We made minor edits to the proposed SSM provisions in response to comments that are shown in section IV.D.5, below.

3. What key comments did we receive on SSM, and what are our responses?

This section provides a summary of key comments and responses regarding SSM. A summary of all other public comments on the proposal and the EPA's responses to those comments is available in the *Summary of Public Comments and Responses for the Risk and Technology Review for Integrated Iron and Steel Manufacturing Facilities* (Docket ID No. EPA–HQ–OAR–2002–0083).

Comment: One commenter stated certain aspects of the Proposed Rule, including the proposed elimination of the SSM exemption, are not based on the EPA's authority to conduct RTR rulemakings under CAA sections 112(f)(2) and (d)(6) but, instead, invoke the EPA's discretion to exercise its other statutory authorities in the same rulemaking. The commenter stated the

proposed elimination of the SSM exemption would bring the 40 CFR part 63, subpart FFFFF standards in line with relevant Court decisions by the D.C. Circuit. The commenter stated in certain cases, the EPA's proposed language would create redundancies and pose problems for compliance that should be addressed.

The commenter stated the EPA should not finalize the additional recordkeeping and reporting requirements included in the proposal under 40 CFR 63.7835, 63.7841, and 63.7842 that would add regulatory burden without adding apparent value.

The commenter stated the preamble explains that the requirement would ''ensure that there is adequate information to determine compliance, to allow the EPA to determine the severity of the failure to meet an applicable standard, and to provide data that may document how the source met the general duty to minimize emissions during a failure to meet an applicable standard.'' The commenter stated the preamble provides no information or examples of how or why the absence of this information has created any issues for the EPA or those subject to the regulation. As a practical matter, the commenter stated, it may not be possible to estimate the quantity of ''each regulated pollutant'' emitted over any emission limit.

The commenter stated the NESHAP provides for work practices and involves regulation of HAP emissions with the use of surrogates. Given that SSM or deviation reports may be due to a permitting authority in relatively short order, the commenter stated it could be very difficult to meet this requirement even where an estimate could be generated. The commenter stated minimizing regulatory burden and avoiding information ''creep'' that tends to institutionalize higher costs are important concerns for regulated entities; it is unclear why this information needs to be supplied on an ongoing basis, rather than providing it in response to an expected, infrequent request from a regulatory authority. Thus, the commenter stated the EPA should remove the proposed requirements to provide estimates quantifying emission limit exceedances or methods used to estimate those emissions in the proposed recordkeeping and reporting requirements in 40 CFR 63.7835, 63.7841, and 63.7842.

Response: The EPA disagrees that the additional reporting and recordkeeping requirements add burden without value. As stated in the proposed rule, recordkeeping and reporting of the information specified in 40 CFR 63.7835, 63.7841, and 63.7842 ensure that there is adequate information to determine compliance, allow the EPA to determine the severity of the failure to meet an applicable standard, and to provide data that may document how the source met the general duty to minimize emissions during a failure to meet an applicable standard.

The procedure for estimating the quantity of pollutant emitted during the deviation is left open because we recognize that precise or direct measurement is not likely unless the failure to meet the applicable standard happens to occur during a performance test. The estimate of emissions is not for each HAP emitted, but for the regulated pollutant, which in the case of a surrogate such as PM, is the surrogate pollutant (PM) itself. A facility has the flexibility to employ any reasonable means to estimate the emissions from a deviation (*e.g.,* mass balance calculations, measurements when available, or engineering judgment based on known process parameters or the effects of a work practice). The estimation of the quantity of pollutant emitted, as the product of the mass emission rate (determined from emissions concentration and gas flow) and the duration of the deviation, are direct indicators of the severity of an issue. Therefore, we maintain that it is appropriate and feasible for facilities to estimate the quantity of each regulated pollutant over the emission limit.

The SSM reports are no longer required by this rule with the removal of the SSM provisions, and the deviation reports are part of the semiannual compliance report, occurring on a known schedule, and have a fixed reporting deadline of 31 days after the end of the reporting period. This deadline provides sufficient time for reporting a deviation that may have occurred on the final day of the reporting period. The EPA is retaining the additional recordkeeping and reporting elements in the final rule, with the exception of the number of deviations, which is unnecessary in light of all deviations being reported.

We agree with the commenter that one of the proposed new SSM requirements, the inclusion of compliance procedures and emissions calculations in the Operations and Maintenance Plan, was not consistent with required content or use of an Operation and Maintenance Plan. To address this inconsistency, we removed certain SSM provisions, described below in section IV.D.5. In addition, see other related rule changes included under electronic reporting, in section IV.E.5 of this preamble.

4. What is the rationale for our final approach for the SSM provisions?

In finalizing the SSM standards in this rule, the EPA has taken into account startup and shutdown periods and, for the reasons explained below, has not proposed alternate standards for those periods. The integrated iron and steel industry has not identified (and there are no data indicating) any specific problems with removing the SSM exemption. We solicited comment on whether any situations exist where separate standards, such as work practices, would be more appropriate during periods of startup and shutdown rather than the current standard. We did not receive any comments on this topic.

Periods of startup, normal operations, and shutdown are all predictable and routine aspects of a source's operations. Malfunctions, in contrast, are neither predictable nor routine. Instead they are, by definition, ''sudden, infrequent, and not reasonably preventable failures of emissions control, process, or monitoring equipment.'' (40 CFR 63.2) (definition of malfunction).

The EPA interprets CAA section 112 as not requiring emissions that occur during periods of malfunction to be factored into development of CAA section 112 standards and this reading has been upheld as reasonable by the Court in *U.S. Sugar Corp.* v. *EPA,* 830 F.3d 579, 606–610 (2016). Under CAA section 112, emissions standards for new sources must be no less stringent than the level ''achieved'' by the best controlled similar source and for existing sources generally must be no less stringent than the average emission limitation ''achieved'' by the best performing 12 percent of sources in the category. There is nothing in CAA section 112 that directs the Agency to consider malfunctions in determining the level ''achieved'' by the best performing sources when setting emission standards. As the Court has recognized, the phrase ''average emission limitation achieved by the best performing 12 percent of sources'' says nothing about how the performance of the best units is to be calculated. *Nat'l Ass'n of Clean Water Agencies* v. *EPA,* 734 F.3d 1115, 1141 (D.C. Cir. 2013). While the EPA accounts for variability in setting emissions standards, nothing in CAA section 112 requires the Agency to consider malfunctions as part of that analysis. The EPA is not required to treat a malfunction in the same manner as the type of variation in performance that occurs during routine operations of a source. A malfunction is a failure of

the source to perform in a ''normal or usual manner'' and no statutory language compels the EPA to consider such events in setting CAA section 112 standards.

As the Court recognized in *U.S. Sugar Corp.,* accounting for malfunctions in setting standards would be difficult, if not impossible, given the myriad different types of malfunctions that can occur across all sources in the category and given the difficulties associated with predicting or accounting for the frequency, degree, and duration of various malfunctions that might occur. *Id.* at 608 (''the EPA would have to conceive of a standard that could apply equally to the wide range of possible boiler malfunctions, ranging from an explosion to minor mechanical defects. Any possible standard is likely to be hopelessly generic to govern such a wide array of circumstances.''). As such, the performance of units that are malfunctioning is not ''reasonably'' foreseeable. See, *e.g., Sierra Club* v. *EPA,* 167 F.3d 658, 662 (D.C. Cir. 1999) (''The EPA typically has wide latitude in determining the extent of data-gathering necessary to solve a problem. We generally defer to an Agency's decision to proceed on the basis of imperfect scientific information, rather than to 'invest the resources to conduct the perfect study.'''), See also, *Weyerhaeuser* v. *Costle,* 590 F.2d 1011, 1058 (D.C. Cir. 1978) (''In the nature of things, no general limit, individual permit, or even any upset provision can anticipate all upset situations. After a certain point, the transgression of regulatory limits caused by 'uncontrollable acts of third parties', such as strikes, sabotage, operator intoxication or insanity, and a variety of other eventualities, must be a matter for the administrative exercise of case-by-case enforcement discretion, not for specification in advance by regulation.''). In addition, emissions during a malfunction event can be significantly higher than emissions at any other time of source operation. For example, if an air pollution control device with 99-percent removal goes off-line as a result of a malfunction (as might happen if, for example, the bags in a baghouse catch fire) and the emission unit is a steady state type unit that would take days to shut down, the source would go from 99-percent control to zero control until the control device was repaired. The source's emissions during the malfunction would be 100 times higher than during normal operations. As such, the emissions over a 4-day malfunction period would exceed the annual emissions of the source during normal operations. As this example illustrates, accounting for malfunctions could lead to standards that are not reflective of (and significantly less stringent than) levels that are achieved by a well-performing non-malfunctioning source. It is reasonable to interpret CAA section 112 to avoid such a result. The EPA's approach to malfunctions is consistent with CAA section 112 and is a reasonable interpretation of the statute.

Although no statutory language compels the EPA to set standards for malfunctions, the EPA has the discretion to do so where feasible. For example, when the EPA conducted the Petroleum Refinery Sector RTR, the EPA established a work practice standard for unique types of malfunctions that result in releases from pressure relief devices or emergency flaring events because the EPA had information to determine that such work practices reflected the level of control that applies to the best performers. 80 FR 75178, 75211–14 (December. 1, 2015). The EPA will consider whether circumstances warrant setting standards for a particular type of malfunction and, if so, whether the EPA has sufficient information to identify the relevant best performing sources and establish a standard for such malfunctions. In the event that a source fails to comply with the applicable CAA section 112(d) standards as a result of a malfunction event, the EPA would determine an appropriate response based on, among other things, the good faith efforts of the source to minimize emissions during malfunction periods, including preventative and corrective actions, as well as root cause analyses to ascertain and rectify excess emissions. The EPA would also consider whether the source's failure to comply with the CAA section 112(d) standard was, in fact, ''sudden, infrequent, not reasonably preventable,'' and was not caused (in any way) by poor maintenance or careless operation. 40 CFR 63.2 (definition of malfunction).

If the EPA determines in a particular case that an enforcement action against a source for violation of an emission standard is warranted, the source can raise any and all defenses in that enforcement action and the Federal district court will determine what, if any, relief is appropriate. The same is true for citizen enforcement actions. Similarly, the presiding officer in an administrative proceeding can consider any defense raised and determine whether administrative penalties are appropriate.

In summary, the EPA interpretation of the CAA and, in particular, CAA section 112 is reasonable and encourages practices that will avoid malfunctions. Administrative and judicial procedures for addressing exceedances of the standards fully recognize that violations may occur despite good faith efforts to comply and can accommodate those situations. *U.S. Sugar Corp.* v. *EPA,* 830 F.3d 579, 606–610 (2016).

We are requiring compliance with the SSM changes for existing sources 180 days from publication of the final rule. This period of time will allow facilities to read and understand the amended rule requirements, to evaluate their operations to ensure that they can meet the standards during periods of startup and shutdown as defined in the rule and make any necessary adjustments, and to convert reporting mechanisms to install necessary hardware and software. The EPA considers a period of 180 days to be the most expeditious compliance period practicable for these source categories and, thus, all affected sources must comply with the revisions to the SSM provisions and electronic reporting requirements no later than 180 days from the effective date of the final rule, or upon startup, whichever is later.

5. What rule changes did we make for the final rule for the SSM Provisions?

In response to comments submitted in regard to the SSM provisions, we made the following changes for the final rule:

- Removed proposed 40 CFR 63.7800(b)(8), ''The compliance procedures within the operation and maintenance plan shall not include any periods of startup or shutdown in emissions calculations.''

E. Electronic Reporting

1. What did we propose for electronic reporting for the Integrated Iron and Steel Manufacturing Facilities source category?

On August 16, 2019, the EPA proposed the requirement that owners and operators of integrated iron and steel facilities submit the required electronic copies of summaries of performance test and performance evaluation results and semiannual reports through the EPA's CDX using the CEDRI. A description of the electronic data submission process is provided in the memorandum titled *Electronic Reporting Requirements for New Source Performance Standards (NSPS) and National Emission Standards for Hazardous Air Pollutants (NESHAP) Rules* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0909). The proposed rule required performance test results to be collected using test methods that are supported by the EPA's ERT, as listed on the ERT website

at the time of the test, be submitted in the format generated through the use of the ERT, and that other performance test results be submitted in PDF using the attachment module of the ERT. Similarly, performance evaluation results of continuous monitoring systems measuring relative accuracy test audit pollutants that are supported by the ERT at the time of the test would be submitted in the format generated through the use of the ERT and other performance evaluation results be submitted in PDF using the attachment module of the ERT.

For semiannual compliance reports, the proposed rule required owners and operators to use the appropriate spreadsheet template to submit information to CEDRI. A draft template for these reports was included in the docket for this rulemaking, and the final template will be available on the CEDRI homepage (*https://www.epa.gov/electronic-reporting-air-emissions/cedri*). Additionally, the EPA identified two broad circumstances in which electronic reporting extensions may be provided. In both circumstances, the decision to accept the claim of needing additional time to report would be within the discretion of the Administrator, and reporting should occur as soon as possible. The EPA is providing these potential extensions to protect owners and operators from noncompliance in cases where they cannot successfully submit a report by the reporting deadline for reasons outside of their control. The situation where an extension may be warranted due to outages of the EPA's CDX or CEDRI that preclude an owner or operator from accessing the system and submitting required reports is addressed in 40 CFR 63.7841(e). The situation where an extension may be warranted due to a force majeure event, which is defined as an event that would be or has been caused by circumstances beyond the control of the affected facility, its contractors, or any entity controlled by the affected facility that prevents an owner or operator from complying with the requirement to submit a report electronically as required by this rule is addressed in 40 CFR 63.7841(f). Examples of such events are acts of nature, acts of war or terrorism, or equipment failure or safety hazards beyond the control of the facility.

2. How did electronic reporting change for the Integrated Iron and Steel Manufacturing Facilities source category?

There were no major changes to the final rule for electronic reporting for the Integrated Iron and Steel Manufacturing Facilities source category. Minor rule edits were made to the proposed requirements in response to comments and are shown in section IV.E.5 below.

3. What key comments did we receive on electronic reporting, and what are our responses?

This section provides a summary of key comments and responses regarding electronic reporting. A summary of all other public comments on the proposal and the EPA's responses to those comments is available in the Summary of Public Comments and Responses for the Risk and Technology Review for Integrated Iron and Steel Manufacturing Facilities (Docket ID No. EPA–HQ–OAR–2002–0083).

Comment: A commenter requested minor technical corrections to the compliance reporting template.

Response: The EPA acknowledges the thorough review of the template by the commenter. Updates to the Integrated Iron and Steel Manufacturing Facilities source category compliance template have been made accordingly to better reflect the provisions of the final rule and address industry comments. These corrections are shown in detail in the response to comment document with responses to specific elements of the comments.

4. What is the rationale for our final approach for electronic reporting?

The electronic submittal of the reports addressed in this rulemaking will increase the usefulness of the data contained in those reports, is in keeping with current trends in data availability and transparency, will further assist in the protection of public health and the environment, will improve compliance by facilitating the ability of regulated facilities to demonstrate compliance with requirements, and by facilitating the ability of delegated state, local, tribal, and territorial air agencies and the EPA to assess and determine compliance, and will ultimately reduce burden on regulated facilities, delegated air agencies, and the EPA. Electronic reporting also eliminates paper-based, manual processes, thereby saving time and resources, simplifying data entry, eliminating redundancies, minimizing data reporting errors, and providing data quickly and accurately to the affected facilities, air agencies, the EPA, and the public. Moreover, electronic reporting is consistent with the EPA's plan to implement Executive Order 13563 and is in keeping with the EPA's Agency-wide policy developed in response to the White House's Digital Government Strategy. For more information on the benefits of electronic reporting, see the memorandum titled *Electronic Reporting Requirements for New Source Performance Standards (NSPS) and National Emission Standards for Hazardous Air Pollutants (NESHAP) Rules* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0909).

5. What rule changes did we make for the final rule for electronic reporting?

In response to comments submitted in regard to electronic reporting, we made the following changes for the final rule:

- Revised 40 CFR 63.7835 to remove requirement to record number of failures to eliminate redundancy with the spreadsheet template that requires the inclusion of every failure;
- Revised 40 CFR 63.7841(b)(4) to remove requirement to report number of failures to eliminate redundancy with the spreadsheet template that requires the inclusion of every failure;
- Revised 40 CFR 63.7841(b)(7) to include citation to newly added 40 CFR 63.7841(b)(13);
- Revised 40 CFR 63.7841(b)(7)(i) to remove the requirement to report the ''number'' of deviations;
- Revised 40 CFR 63.7841(b)(8) to include citation to newly added 40 CFR 63.7841(b)(13);
- Revised 40 CFR 63.7841(b)(8)(ii) to add ''and duration'', as in (iii);
- Revised 40 CFR 63.7841(b)(9) to include citation to newly added 40 CFR 63.7841(b)(13);
- Added 40 CFR 63.7841(b)(13) to provide 180 days after publication in the **Federal Register** for all sources that failed to meet an applicable standard to include in the compliance report for each failure the start date, start time and duration of each failure and a list of the affected sources or equipment, an estimate of the quantity of each regulated pollutant emitted over any emission limit, and a description of the method used to estimate the emissions;
- Revised 40 CFR 63.7841(c) to specify the beginning of electronic reporting to begin either 180 days after promulgation of the final rule or 180 days after the template is available in CEDRI, whichever is later; and
- Removed proposed 40 CFR 63.7843(d) to eliminate redundancy with existing language in 40 CFR 63.10(b)(1).

F. Other Issues Regarding UFIP Sources of HAP Emissions

In this section we address other issues related to UFIP emissions sources that are not addressed above in section IV.A of this preamble.

1. How were other relevant issues regarding UFIP sources of HAP emissions addressed in the proposed rule for the Integrated Iron and Steel Manufacturing Facilities source category?

As described in Section IV.A of this preamble, in the August 16, 2019, proposal, we discussed seven UFIP HAP emission sources (84 FR at 42708) and requested comments on all aspects of the UFIP analyses. We did not propose any standards for these sources.

The UFIP emission sources described in the proposal included BF bleeder valve unplanned openings (also known as slips), BF bleeder valve planned openings, BF bell leaks, BF casthouse fugitives, BF iron beaching, BF slag handling and storage operations, and BOPF shop fugitives. These UFIP emission sources were identified by observation of visible plumes of fugitives and intermittent emissions being emitted from the seven UFIP sources during inspections by EPA Regional staff [17] and discussed in the technical memorandum titled *Development of Emissions Estimates for Fugitive or Intermittent HAP Emission Sources for an Example Integrated Iron and Steel Facility for Input to the RTR Risk Assessment* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0956). The NESHAP already contains opacity limits for two of these sources—BF casthouse fugitives and BOPF shop fugitives.

The emissions from these UFIP sources were included in the risk assessment in an example facility analysis to assess the potential risk contributed by UFIP and the effect that omission of these sources has on the estimated risks for the source category as a whole. (See section IV.A.1 and Table 2 of this preamble for the risk estimated for the source category).

As explained in section IV.A in regard to the UFIP and potential work practices, and consistent with our explanation in the proposed rule (see 84 FR 42704) that was based on consideration of all our analyses and related information including the risk analysis results, costs, and uncertainties, we determined in the proposal that the current NESHAP provides an ample margin of safety to protect public health and that no additional standards are required under CAA section 112(f). This decision was based largely on the substantial uncertainties in the estimates of the baseline HAP emissions from UFIP emission sources, costs of the work practices, HAP risk reductions that would be achieved by the work practices, and uncertainties raised by industry in their comments regarding potential effects of the work practices on the facilities' operations, safety, and economics.

Furthermore, as described in section IV.B, for most of the same reasons discussed above in regard to ample margin of safety analysis for UFIP emissions, no new standards were proposed for the two regulated UFIP sources under the technology review pursuant to CAA section 112(d)(6).

2. How did the final rule change based on the comments received about UFIP sources?

We are not promulgating any new standards for UFIP emissions sources under the risk or technology reviews, as described in sections IV.A and IV.B. We also are not taking final action to establish additional emission standards for any of the UFIP emissions sources under any other CAA authority at this time. Although we received many comments on UFIP sources, both supporting and opposing additional standards, we did not receive any additional data on UFIP emissions or on the effectiveness of the work practices. We did receive some limited additional information on costs that suggested we may have underestimated the costs for some of the work practices discussed in the proposal, but no citations or documentation were provided to validate the new cost information. We also received comments that suggested we may have overestimated UFIP emissions and control-effectiveness of the work practices, but, again, without any citations of documentation for other emission estimates or control efficiencies of the work practices. For these reasons, and because we do not have adequate information to resolve the substantial uncertainty that remains for the UFIP emissions estimates, control efficiency of the work practices, costs, and other factors, we are not promulgating any new requirements for UFIP sources in this action.

3. What key comments did we receive about UFIP sources that were not already addressed under the risk review section of this preamble and what are our responses?

This section provides a summary of some of the key comments and responses regarding UFIP sources not addressed above in section IV.A.3. A summary of all other public comments on the proposal in regard to UFIP and the EPA's responses to those comments are available in the document *Summary of Public Comments and Responses for the Risk and Technology Review for Integrated Iron and Steel Manufacturing Facilities,* located in the docket for this rule (Docket ID No. EPA–HQ–OAR–2002–0083).

Comment: One commenter recognized that the EPA identified the work practice information as uncertain, and in fact, too uncertain to be relied upon in this rulemaking. The commenter appreciated the EPA's recognition of these issues and supported the Agency's conclusions. The commenter is pleased that the EPA is not proposing to rely on unsupported conclusions as part of a final rule.

Another commenter stated the EPA created the ''UFIP'' designation to refer to emissions that facilities generally try to prevent from occurring in the first place. In other words, facilities are already naturally incentivized to prevent many UFIP emissions as they reflect nonoptimal operation. Thus, the commenter says, facilities operate to minimize these emissions without additional regulatory requirements; imposing a regulatory overlay would be problematic from an operational perspective and would not lead to reduced emissions. The commenter stated regulating these sources would dictate *how* facilities operate—effectively freezing approaches in time when they should be evolving as part of the continuous improvement process. Second, the commenter stated regulation would impose a one-size-fits-all approach for sources that make products in different ways and have different configurations. Third, the commenter stated regulation of UFIP would create a micro-managerial structure that would be costly—even if not from a capital investment perspective—because of the operational nature of many of the approaches the EPA considered. This micro-managerial structure, the commenter stated, would lead to only ''paperwork'' deviations, by imposing onerous recordkeeping requirements, which will mean that operators' and inspectors' attention will be taken away from critical aspects of plant operations, even when a plant is not causing increased emissions. Thus, the commenter concluded the emission reduction practices presented by the EPA for UFIP sources provide no risk reduction benefit despite the cost and effort they entail. Finally, the commenter stated that, given the intense competition in this industry, which stretches well beyond U.S. borders, these requirements would put U.S. facilities at a cost disadvantage—and

[17] See the report, *EPA Region V Enforcement Summary—UFIP Opacity from Integrated Iron and Steel Facility Violation Reports—2007 through 2014.* (Docket ID Item No. EPA–HQ–OAR–2002–0083–0997.)

would do so without generating commensurate emissions and risk reductions.

The commenter stated the EPA appropriately acknowledges that there are significant uncertainties in costs, effectiveness, and feasibility of the work practice options on which it seeks comment. The commenter stated the estimates in the proposal drastically understate the costs and likewise overstate any emission reductions that would be achieved, since companies already work to prevent these emissions and are incentivized to do so to maintain their operations in the most efficient and safe manner. Although the EPA estimates the specific costs for each of the work practices discussed in the proposal preamble, the commenter stated the EPA fails to attribute potential HAP emissions reductions individually, and, thus, does not appropriately estimate cost effectiveness. The commenter stated that, even without these additional considerations, the EPA is right not to require them, and that with an accurate view of the costs and benefits of this regulatory overlay, the EPA decision is unquestionably correct.

The commenter stated given the risk modeling, the work practice options discussed are not necessary to provide an ample margin of safety. The commenter stated the various compliance and enforcement documents related to the so-called UFIP sources in the rulemaking docket are not to the contrary. Moreover, the commenter stated it would be unreasonable to require the potential work practices as doing so would codify practices that already occur voluntarily or pursuant to current federal or state requirements and drive up costs of compliance without resulting in any risk reduction. The commenter stated adding a substantial administrative burden to an important economic sector, particularly without clear benefit, is contrary to Congress' purpose under the CAA and with reasoned decision-making. The commenter stated the focus should be on maximizing environmentally beneficial results, not paperwork. The commenter stated codifying work practices that already take place on a case-by-case basis would result in a misdirection of resources not only from the steel industry to comply with added monitoring, recordkeeping, and reporting requirements, but also from the EPA by having to assure compliance with details that ultimately have little bearing on air quality and public health.

The commenter stated many of the work practices are practically infeasible as applied to particular plants or, generally, not cost effective and, in some instances, could even be contrary to practices established to assure facility safety, such as what would result from reducing natural ventilation and other effects of closing the openings and air holes in the BF casthouse and BOP shop. These effects include cost to the facility to otherwise increase breathing space ventilation for workers; the wear and tear on control equipment due to higher-than-design air flowrates; the cost to document opening and closing of doors, windows, *etc.,* to accommodate large equipment and vehicle traffic into buildings; difficulty in accessing some openings that may be hundreds of feet off the ground, requiring significant precautions due to the height alone; and prevent the opening of pressure relief panels, which would badly damage building exteriors during high-pressure events, etc. Therefore, the commenter stated the EPA should, thus, finalize its proposal not to amend 40 CFR part 63, subpart FFFFF to require additional work practices for UFIP sources.

Response: The EPA acknowledges the support by the commenter for the proposed conclusions, which are being finalized in this document. The EPA also acknowledges, as the commenter points out, the complexities in controlling emissions from UFIP sources. The EPA also is pleased to know that the industry is already attempting to minimize these emissions.

We do not agree with the commenter that many of the work practices are ''practically infeasible'' at all plants, but we cannot adequately assess the effectiveness or impacts of the work practices without more specific descriptions of actual facility experience with, or analyses of, the impacts of the work practices, including potential changes in air flow into and out of the buildings beyond the extreme consequences hypothesized by the commenter, which mostly only concern BF casthouse and BOP shop operations. With the understanding that the work practices could be more difficult to implement at some facilities than others, we sought specific comments on the general feasibility of the work practices, with the hope that commenters could have described ways to improve or modify the work practice so as to be amenable to their use at all facilities. Unfortunately, we received very little information through the public comments to improve our understanding of which work practices would be generally feasible and appropriate across the industry.

In regard to calculating cost effectiveness, since the HAP being evaluated are all various PM HAP metals, we conclude that it would neither be appropriate nor logical to apportion control costs of a work practice or control device to each metal HAP in this case, mainly because the intent of the control methods we analyzed is to minimize emissions of the mix of PM HAP metals. Nevertheless, as described elsewhere in this preamble, the EPA is not promulgating any new or revised standards for UFIP sources in this action.

Comment: One commenter stated, based on the record, it is unclear how or why the EPA ended its staff's consideration of the work practice standards for the proposal, or on what basis it did so. In addition, the commenter noted that the EPA contacted Michigan and Indiana and provided ''draft work practice standards,'' as shown by email communications with these states in 2018. The commenter continued that there was some material in the bodies of the emails that the EPA has disclosed showing these would likely have been important and achieved significant emission reductions. It is clear to the commenter that the EPA staff long planned to propose significant emission reduction requirements, based on the evidence they have in the record, and that the state air quality inspectors and regulators also supported these requirements.

The commenter stated the EPA has failed to show how it can lawfully or rationally not follow what its own regulatory staff initially provided to stakeholders, what its enforcement staff apparently support (EPA Region V), and what state regulators in Michigan and Indiana have also supported as needed to reduce UFIP emissions and protect public health. The commenter stated the EPA's ''about-face'' from its staff's and state air regulators' recommendations, and its ultimate refusal to follow the evidence in the record illustrate that this proposal, if finalized, would be unlawful and arbitrary. The commenter stated it appears that the EPA Administrator has not acted with the requisite open mind to consider the relevant statutory requirements, record, or staff recommendations which would have led to a stronger proposal and a stronger final rule. The commenter stated the EPA will violate the CAA and engage in the ultimate in capricious decision making if it attempts to finalize this proposed rule which lacks the necessary statutory requirements as well as the required rational connection to the facts shown in the record.

Response: While the EPA agrees with the commenter that the UFIP HAP emissions issue and related information

available to the EPA were worthy of bringing forth to the public and asking for comment in the proposal, no additional technical information was received to improve our understanding or quantification of the UFIP emissions or our understanding of the effectiveness of using work practices to control UFIP emissions. We received some new cost information that suggests that we underestimated the costs of the work practices, but that new information was not documented or cited. We also received comments that we overestimated UFIP emissions and overestimated the effectiveness of the work practices, which combined with information suggesting we underestimated costs, if accurate, would make control of UFIP emissions substantially less cost-effective than the values we presented in the proposal preamble. In addition, although environmental groups submitted comments in general support of UFIP regulations, no comments were received from citizens or community groups living in the areas of the integrated iron and steel facilities supporting the UFIP emission regulations, or on the impact to local residents of not requiring work practices to reduce emissions from these sources, or any other claims as such. Therefore, because of the uncertainty in the UFIP emission estimates, cost estimates, and control efficiencies of the work practices; and the lack of complete information about the impact of UFIP emissions at all facilities (as described above in previous comments), the EPA is not promulgating any work practice standards for UFIP emissions at this time. See above section IV.A for a more detailed discussion of the estimated risk from UFIP emissions.

4. What is our rationale for our final approach for the UFIP sources?

The decision not to promulgate any new standards for UFIP sources at this time is based largely on the uncertainties in the UFIP assessment in terms of the emission estimates, costs of the work practices, how much emission reduction the work practices could achieve, and the potential negative effects of the work practices on the facilities' operations, safety, and economics. For five of the UFIP sources not currently regulated,[18] we would need to promulgate standards for these sources pursuant to CAA section 112(d)(2) and (3), which would necessitate an analysis of the top performers under CAA sections 112(d)(2) and (3). The lack of quantitative emissions data (and the time and techniques to obtain such data) for UFIP sources and/or the lack of other relevant information (such as reliable information regarding the effectiveness of each of the work practices), which is needed to establish the top performing facilities and the MACT floor level of control, prevents us from establishing appropriate emissions standards for the five UFIP sources at this time.

With regard to the other two UFIP sources currently regulated (*i.e.,* BF casthouse and BOPF shop), since we have concluded that risks due to emissions from the source category are acceptable, we would need to promulgate standards for these two UFIP sources pursuant to CAA section 112(d)(6) or under the ample margin of safety analysis phase of our section 112(f) review, both of which include considerations of costs and other factors. As explained previously in this preamble, the EPA has decided to not promulgate any of the work practices for these two UFIP sources at this time mainly because of the substantial uncertainties in the UFIP assessment in terms of baseline emissions, costs of the work practices, how much emission reduction the work practices could achieve; and, the potential negative effects of the work practices on the facilities' operations, safety, and economics.

[18] The five currently unregulated UFIP sources are BF bleeder valve unplanned openings (also known as slips), BF bleeder valve planned openings, BF bell leaks, BF iron beaching, and BF slag handling and storage operations.

G. Other Items

Other items in this final rule are IBR, compliance dates, and other rule changes not discussed elsewhere in this preamble. These issues are discussed below.

1. IBR Under 1 CFR Part 51

On August 16, 2019, the EPA proposed regulatory text that includes IBR. In accordance with requirements of 1 CFR 51.5, the EPA proposed to incorporate by reference the following documents and to amend 40 CFR 63.14 to identify the provisions for which these documents are IBR approved for this rule:

- ANSI/ASME PTC 19.10–1981, Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus], issued August 31, 1981, IBR approved for 40 CFR 63.7822(b), 63.7824(e), and 63.7825(b). This method determines quantitatively the gaseous constituents of exhausts resulting from stationary combustion sources. The gases addressed in the method are oxygen, carbon dioxide, carbon monoxide, nitrogen, sulfur dioxide, sulfur trioxide, nitric oxide, nitrogen dioxide, hydrogen sulfide, and hydrocarbons. The method is approved for this rule with caveats described in section VI.J of this preamble.
- EPA–454/R–98–015, Office of Air Quality Planning and Standards (OAQPS), Fabric Filter Bag Leak Detection Guidance, September 1997, IBR approved for 40 CFR 63.7831(f). This document provides guidance on the use of triboelectric monitors as fabric filter bag leak detectors. The document includes fabric filter and monitoring system descriptions; guidance on monitor selection, installation, setup, adjustment, and operation; and quality assurance procedures.

For the final rule, in response to comments, we have added the following voluntary consensus standard (VCS) approved as an alternate method to measure opacity under 40 CFR part 63, subpart FFFFF, with caveats described in section VI.J of this preamble; we will incorporate the method by reference in the amendments to 40 CFR 63.14:

- ASTM D7520–16, Standard Test Method for Determining the Opacity of a Plume in the Outdoor Ambient Atmosphere, approved April 1, 2016, IBR approved for 40 CFR 63.7823(c), 63.7823(d), 63.7823(e), and 63.7833(g). This method describes procedures to determine the opacity of a plume, using digital imagery and associated hardware and software, where opacity is caused by PM emitted from a stationary point source in the outdoor ambient environment. The opacity of emissions is determined by the application of a DCOT that consists of a digital still camera, analysis software, and the output function's content to obtain and interpret digital images to determine and report plume opacity. The method is approved for this rule with caveats described in section VI.J of this preamble.

The ANSI/ASME document is available from the American Society of Mechanical Engineers (ASME) at *http://www.asme.org;* by mail at Three Park Avenue, New York, NY 10016–5990; or by telephone at (800) 843–2763. The ASTM D7520–16 document is available from the American Society for Testing and Materials (ASTM) at *https://www.astm.org* or 1100 Barr Harbor Drive, West Conshohocken, PA 19428–2959, telephone number: (610) 832–9500, fax number: (610) 832–9555, or email: *service@astm.org.* The EPA has made, and will continue to make, the EPA document generally available electronically through *https://www.regulations.gov/* and at the EPA Docket Center (see the **ADDRESSES**

section of this preamble for more information).

2. Compliance Dates

On August 16, 2019, we proposed to provide existing sources with 180 days after the effective date of the final rule to comply with the changes to the SSM provisions in 40 CFR part 63, subpart FFFFF and all other new or revised requirements in this rule except for the mercury emission limits, for which we proposed to require compliance within 1 year. We proposed that new sources, defined as BOPFs, BOPF shops, or facilities constructed or reconstructed after August 16, 2019, would be required to comply with all requirements on the effective date of the final rule, or upon startup, whichever is later.

In the final rule, for the SSM provisions and all other new or revised requirements in this rule except for those related to the mercury standards, we are finalizing the compliance times as proposed (180 days) for existing sources, and new sources will need to comply upon the effective date of the final rule or upon startup, whichever is later. Regarding the mercury standards and associated requirements, we are providing for existing sources the same deadlines as proposed (*i.e.,* 1 year to comply). An additional year may be provided for compliance via the states as per 40 CFR part 63 General Provisions (40 CFR 63.6(i)) for facilities needing to make process changes or install control equipment. As proposed and consistent with the CAA, new sources must comply upon the effective date of the final rule or upon startup, whichever is later.

For electronic reporting, the final rule provides that facilities must comply with the electronic reporting requirements for semiannual compliance reports either 180 days after date of publication in the **Federal Register** of the final rule or 180 days after the electronic reporting template for Integrated Iron and Steel Manufacturing Facilities is available in CEDRI, whichever is later, to allow for EPA revisions to the template in response to comments.

3. What other rule changes did we make in the final rule?

In the final rule, we made the following technical and editorial corrections and clarifications:

- Revised 40 CFR 63.7810(a) to provide sources that commenced construction or reconstruction on or before August 16, 2019, 180 days after publication in the **Federal Register** for all sources to comply with emission limitations during periods of SSM;
- Revised 40 CFR 63.7810(c) to remove the SSM plan requirement 180 days after publication in the **Federal Register** for sources that commenced construction or reconstruction on or before August 16, 2019 and to remove the SSM plan requirement upon publication in the **Federal Register** for all sources that commenced construction or reconstruction after August 16, 2019;
- Revised 40 CFR 63.7810(d) to provide sources that commenced construction or reconstruction on or before August 16, 2019 with 180 days to comply with the general duty requirement in 40 CFR 63.7810(d). Prior to the expiration of the 180 days, such sources must comply with the provisions in 40 CFR 63.6(e)(1)(i);
- Revised 40 CFR 63.7822(a) to provide 180 days after publication in the **Federal Register** for all sources that commenced construction or reconstruction on or before August 16, 2019 comply with the revised requirement to conduct each performance test under conditions representative of normal operations, excluding periods of startup and shutdown and malfunction. Prior to the expiration of 180 days, such sources must comply with the pre-existing requirement to conduct performance tests based on representative performance;
- Revised 40 CFR 63.7822 and 63.7823 to specify the conditions for conducting performance tests;
- Revised 40 CFR 63.7822(b)(1)(iii), 63.7824(e)(1)(iii), and 63.7825(b)(1)(iii) to IBR ANSI/ASME PTC 19.10–1981;
- Revised 40 CFR 63.7822, 63.7823, 63.7824, and 63.7833 to clarify the location in 40 CFR part 60 of applicable EPA test methods;
- Revised 40 CFR 63.7823(a) to specify initial compliance with the opacity limits should be based on representative performance which excludes periods of startup and shutdown and malfunction;
- Added to 40 CFR 63.7823(c)(1), (d)(1)(i), (d)(2)(i), (e)(1) and 63.7833(g)(3) to IBR the ASTM D7520–16 method as an alternative VCS to EPA Method 9 opacity observations; added ''For Method 9'' to 40 CFR 63.7823(e)(3) to clarify that using an observer is only for EPA Method 9;
- Revised 40 CFR 63.7831(a)(4) to clarify that sources that commenced construction or reconstruction on or before August 16, 2019, and, therefore, are not required to comply during periods of SSM until after 180 days after publication in the **Federal Register**, are subject during that 180 day period to the requirements in 40 CFR 63.8(c)(1)(ii), (c)(3), (c)(4)(ii), (c)(7), and (c)(8);
- Revised 40 CFR 63.7831(a)(5) to clarify that sources that commenced construction or reconstruction on or before August 16, 2019, and, therefore, are not required to comply during periods of SSM until after 180 days after publication in the **Federal Register**, are subject during that 180 day period to the requirements related to SSM plans referenced in 40 CFR 63.8(d)(3);
- Revised 40 CFR 63.7831(a)(6) to provide sources constructed or reconstructed on or before August 16, 2019, and, therefore, are not required to comply during periods of SSM until after 180 days after publication in the **Federal Register**, are subject during that 180 day period to the requirements in § 63.10(c)(1) through (c)(14), and (e)(1) and (e)(2)(i);
- Revised 40 CFR 63.7831(f)(4) to IBR for EPA–454/R–98–015;
- Added 40 CFR 63.7835(d) to specify that for sources that commenced construction or reconstruction after August 16, 2019 the exemptions for deviations that occur during a period of startup, shutdown, or malfunction no longer apply 180 days after publication in the **Federal Register**, and for all other sources the exemptions no longer apply as of the date of publication of the final rule in the **Federal Register**;
- Revised 40 CFR 63.7835, 63.7841, and 63.7842 to include the requirements to record and report information on failures to meet the applicable standard;
- Added 40 CFR 63.7840 and 63.7841 electronic reporting requirements of required summaries of performance test results and semiannual reports;
- Revised 40 CFR 63.7841(b)(4) to specify that for sources that commenced construction or reconstruction after August 16, 2019 a SSM plan and the information in 40 CFR 63.10(d)(5)(i) are no longer required 180 days after publication in the **Federal Register**;
- Added 40 CFR 63.7841(b)(12) to specify that for sources that commenced construction or reconstruction after August 16, 2019 a SSM report is no longer required 180 days after publication in the **Federal Register**;
- Revised 40 CFR 63.7842(a)(2) to specify records related to SSM to be kept;
- Revised Table 1 of 40 CFR part 63, subpart FFFFF to add a mercury emission limit, revised Table 2 to add demonstration of initial compliance with the mercury emission limit, and revised Table 3 to add demonstration of continuous compliance with the mercury emission limit;

- Revised Tables 1 and 3 of 40 CFR part 63, subpart FFFFF to clarify that opacity observations be made at all openings to the BF casthouse;
- Revised Tables 1, 2, and 3 of 40 CFR part 63, subpart FFFFF to clarify that the affected source is each BOPF shop; and
- Eliminated the SSM exemption with revisions to Table 4 (the General Provisions table) of 40 CFR part 63, subpart FFFFF and updated citations throughout the remaining rule text.

V. Summary of Cost, Environmental, and Economic Impacts and Additional Analyses Conducted

A. What are the affected sources?

The affected sources are facilities in the Integrated Iron and Steel Manufacturing Facilities source category. This includes any facility engaged in producing steel from iron ore. Integrated iron and steel manufacturing includes the following processes: Sinter production, iron production, iron preparation (hot metal desulfurization), and steel production. The iron production process includes the production of iron in BFs by the reduction of iron-bearing materials with a hot gas. The steel production process includes BOPF. Based on the data we have, there are eleven integrated iron and steel manufacturing facilities subject to this NESHAP, but one of these facilities is idle.

B. What are the air quality impacts?

We are promulgating standards for mercury that may result in unquantified reductions of mercury emissions and consequently improve air quality to some degree.

C. What are the cost impacts?

In this final rule, we require control of mercury emissions and allow sources to demonstrate compliance through performance testing or scrap selection requirements. We expect that facilities that choose scrap selection as their method of demonstrating compliance likely will not incur operational costs to comply with this requirement because we understand that most, if not all, facilities are already purchasing all their auto scrap from providers who participate in the NVMSRP. Therefore, we estimate a cost of $1,058 per year per facility and $11,639 per year for all 11 facilities in the industry, for recordkeeping and reporting of compliance with the standards.

D. What are the economic impacts?

Negligible economic impacts are expected to be incurred by integrated iron and steel facilities due to the mercury emission limit because the information available to the EPA indicates that most, if not all, facilities are already purchasing scrap from providers who participate in the NVMSRP.

E. What are the benefits?

These promulgated amendments may result in some unquantified reductions in emissions of mercury, depending on the extent of current limitation of mercury input or participation in the scrap selection program by integrated iron and steel facilities. While the industry has reported to the EPA that most, or all, facilities are already meeting the proposed mercury emission limit, to the extent that additional reductions may be achieved, this rule may result in improved health in surrounding populations, especially protection of children from the negative health impacts of mercury exposure.

The requirements to submit reports and test results electronically will reduce paperwork and improve monitoring, compliance, and implementation of the rule.

F. What analysis of environmental justice did we conduct?

For this action, we examined the potential for any environmental justice issues that might be associated with the source category through a demographic analysis, which is an assessment of risks to individual demographic groups of the populations living within 5 kilometer (km) and within 50 km of the facilities. In the analysis, we evaluated the distribution of HAP-related cancer and noncancer risks from point sources in the Integrated Iron and Steel Manufacturing Facilities source category across different demographic groups within the populations living near facilities.

The results of the demographic analysis are summarized in Table 5 below. These results, for various demographic groups, are based on the estimated risk from actual emissions from point sources for the population living within 50 km of the facilities.

TABLE 5—INTEGRATED IRON AND STEEL MANUFACTURING FACILITIES DEMOGRAPHIC RISK ANALYSIS RESULTS

Item	Nationwide	Population with cancer risk at or above 1-in-1 million due to integrated iron and steel manufacturing facilities	Population with chronic HI at or above 1 due to integrated iron and steel manufacturing facilities
Total Population	317,746,049	64,158	0
White and Minority by Percent			
White	62%	63%	0%
Minority	38%	37%	0%
Minority by Percent			
African American	12%	29%	0%
Native American	0.8%	0.1%	0%
Hispanic or Latino includes white and nonwhite)	18%	4%	0%
Other and Multiracial	7%	4%	0%
Income by Percent			
Below Poverty Level	14%	23%	0%
Above Poverty Level	86%	77%	0%
Education by Percent			
Over 25 and without High School Diploma	14%	12%	0%

TABLE 5—INTEGRATED IRON AND STEEL MANUFACTURING FACILITIES DEMOGRAPHIC RISK ANALYSIS RESULTS—Continued

Item	Nationwide	Population with cancer risk at or above 1-in-1 million due to integrated iron and steel manufacturing facilities	Population with chronic HI at or above 1 due to integrated iron and steel manufacturing facilities
Over 25 and with a High School Diploma	86%	88%	0%
Linguistically Isolated by Percent			
Linguistically Isolated	6%	0.6%	0%

The results of the Integrated Iron and Steel Manufacturing Facilities source category demographic analysis indicate that point source emissions from the source category expose approximately 64,000 people to a cancer risk at or above 1-in-1 million and zero people to a chronic noncancer HI greater than or equal to 1. The percentages of the at-risk population in each demographic group (except for African American and Below Poverty Level) are similar to or lower than their respective nationwide percentages. The African American population with cancer risk at or above 1-in-1 million due to Integrated Iron and Steel Manufacturing Facilities source category emissions is more than 3 times the national average. Likewise, populations living ''Below Poverty Level'' exposed to cancer risk at or above 1-in-1 million is nearly twice the national average. However, the risks to all demographic groups is less than 100-in-1 million.

The methodology and the results of the demographic analysis are presented in a technical report, *Risk and Technology Review—Analysis of Demographic Factors for Populations Living Near Integrated Iron and Steel Manufacturing Facilities* (Docket ID Item No. EPA–HQ–OAR–2002–0083–1060).

VI. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at *https://www.epa.gov/laws-regulations/laws-and-executive-orders.*

A. Executive Orders 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is a not a significant regulatory action and was, therefore, not submitted to the Office of Management and Budget (OMB) for review.

B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs

This action is not an Executive Order 13771 regulatory action because this action is not significant under Executive Order 12866.

C. Paperwork Reduction Act (PRA)

The information collection activities in this final rule have been submitted for approval to OMB under the PRA. The ICR document that the EPA prepared has been assigned EPA ICR number 2003.09. You can find a copy of the ICR in the docket for this rule, and it is briefly summarized here. The information collection requirements are not enforceable until OMB approves them.

These amendments require electronic reporting; remove the SSM exemptions; and impose other revisions that affect reporting and recordkeeping for integrated iron and steel facilities. We are also promulgating standards for mercury that require facilities to certify the type of steel scrap they use or conduct a performance test. This information is collected to assure compliance with 40 CFR part 63, subpart FFFFF.

Respondents/affected entities: Integrated iron and steel manufacturing facilities.

Respondent's obligation to respond: Mandatory (40 CFR part 63, subpart FFFFF).

Estimated number of respondents: 11 facilities.

Frequency of Response: One time.

Total estimated burden: The annual recordkeeping and reporting burden for facilities to comply with all of the requirements in the NESHAP is estimated to be 6,500 hours (per year). Burden is defined at 5 CFR 1320.3(b).

Total estimated cost: The annual recordkeeping and reporting cost for all facilities to comply with all of the requirements in the NESHAP is estimated to be $800,000 (per year), of which $20,000 (per year) is for this rule, and $780,000 is for other costs related to continued compliance with the NESHAP including $50,300 for paperwork associated with operation and maintenance requirements. The total rule costs reflect a savings of $210,000 (per year) from the previous ICR due to the transition to electronic reporting.

An Agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations in 40 CFR are listed in 40 CFR part 9. When OMB approves this ICR, the Agency will announce that approval in the **Federal Register** and publish a technical amendment to 40 CFR part 9 to display the OMB control number for the approved information collection activities contained in this final rule.

D. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. This action will not impose any requirements on small entities. No small entities are subject to the requirements of this rule.

E. Unfunded Mandates Reform Act (UMRA)

This action does not contain an unfunded mandate of $100 million or more as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. While this action creates an enforceable duty on the private sector, the cost does not exceed $100 million or more.

F. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications as specified in Executive Order 13175. It will not have substantial direct effects on tribal governments, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes. No tribal governments own facilities subject to the NESHAP. Thus, Executive Order 13175 does not apply to this action.

H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

This action is not subject to Executive Order 13045 because the EPA does not believe the environmental health or safety risks addressed by this action present a disproportionate risk to children. This action's health and risk assessments are contained in sections III and IV of this preamble and further documented in the document titled *Residual Risk Assessment for the Integrated Iron and Steel Manufacturing Facilities Source Category in Support of the Risk and Technology Review 2020 Final Rule,* in the docket for this rule (Docket ID No. EPA–HQ–OAR–2002–0083).

I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This action is not subject to Executive Order 13211 because it is not a significant regulatory action under Executive Order 13211.

J. National Technology Transfer and Advancement Act (NTTAA) and 1 CFR Part 51

This action involves technical standards. Therefore, the EPA conducted searches for the Iron and Steel Manufacturing Facilities NESHAP through the Enhanced National Standards Systems Network Database managed by the American National Standards Institute (ANSI). We also contacted VCS organizations and accessed and searched their databases. We conducted searches for EPA Methods 1, 2, 2F, 2G, 3, 3A, 3B, 4, 5, 5D, 9, 17, 25, 29, and 30B of 40 CFR part 60, appendix A and SW–846 Method 9071B Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, EPA Publications SW–846 third edition. During the EPA's VCS search, if the title or abstract (if provided) of the VCS described technical sampling and analytical procedures that are similar to the EPA's reference method, the EPA reviewed it as a potential equivalent method. We reviewed all potential standards to determine the practicality of the VCS for this rule. This review requires significant method validation data that meet the requirements of EPA Method 301 for accepting alternative methods or scientific, engineering and policy equivalence to procedures in the EPA reference methods. The EPA may reconsider determinations of impracticality when additional information is available for a particular VCS. No applicable VCS were identified for EPA Methods 1A, 2F, 2G, 5D, 30B, and SW–846 Method 9071B.

The EPA is incorporating by reference the VCS ANSI/ASME PTC 19.10–1981, ''Flue and Exhaust Gas Analyses.'' We are revising 40 CFR 63.7822(b), 40 CFR 63.7824(e), and 40 CFR 63.7825(b) to provide that the manual procedures (but not instrumental procedures) of VCS ANSI/ASME PTC 19.10–1981—Part 10 may be used as an alternative to EPA Method 3B.The manual procedures (but not instrumental procedures) of VCS ANSI/ASME PTC 19.10–1981—Part 10 (incorporated by reference—see 40 CFR 63.14) may be used as an alternative to EPA Method 3B for measuring the oxygen or carbon dioxide content of the exhaust gas. This standard is acceptable as an alternative to EPA Method 3B and is available from ASME at *http://www.asme.org;* by mail at Three Park Avenue, New York, NY 10016–5990; or by telephone at (800) 843–2763. This method determines quantitatively the gaseous constituents of exhausts resulting from stationary combustion sources. The gases covered in ANSI/ASME PTC 19.10–1981 are oxygen, carbon dioxide, carbon monoxide, nitrogen, sulfur dioxide, sulfur trioxide, nitric oxide, nitrogen dioxide, hydrogen sulfide, and hydrocarbons, however the use in this rule is only applicable to oxygen and carbon dioxide.

In the final rule, the EPA is incorporating by reference the VCS ASTM D7520–16, Standard Test Method for Determining the Opacity of a Plume in the Outdoor Ambient Atmosphere, as an acceptable alternative to EPA Method 9 with the following caveats:

- During the DCOT certification procedure outlined in Section 9.2 of ASTM D7520–16, the facility or the DCOT vendor must present the plumes in front of various backgrounds of color and contrast representing conditions anticipated during field use such as blue sky, trees, and mixed backgrounds (clouds and/or a sparse tree stand).
- The facility must also have standard operating procedures in place including daily or other frequency quality checks to ensure the equipment is within manufacturing specifications as outlined in Section 8.1 of ASTM D7520–16.
- The facility must follow the recordkeeping procedures outlined in 40 CFR 63.10(b)(1) for the DCOT certification, compliance report, data sheets, and all raw unaltered JPEGs used for opacity and certification determination.
- The facility or the DCOT vendor must have a minimum of four independent technology users apply the software to determine the visible opacity of the 300 certification plumes. For each set of 25 plumes, the user may not exceed 15-percent opacity of anyone reading and the average error must not exceed 7.5-percent opacity.
- This approval does not provide or imply a certification or validation of any vendor's hardware or software. The onus to maintain and verify the certification and/or training of the DCOT camera, software, and operator in accordance with ASTM D7520–16 is on the facility, DCOT operator, and DCOT vendor. This method describes procedures to determine the opacity of a plume, using digital imagery and associated hardware and software, where opacity is caused by PM emitted from a stationary point source in the outdoor ambient environment. The opacity of emissions is determined by the application of a DCOT that consists of a digital still camera, analysis software, and the output function's content to obtain and interpret digital images to determine and report plume opacity. The ASTM D7520–16 document is available from ASTM at *https://www.astm.org* or 1100 Barr Harbor Drive, West Conshohocken, PA 19428–2959, telephone number: (610) 832–9500, fax number: (610) 8329555 at *service@astm.org.*

The EPA is finalizing the use of the guidance document, *Fabric Filter Bag Leak Detection Guidance,* EPA–454/R–98–015, Office of Air Quality Planning and Standards (OAQPS), U.S. Environmental Protection Agency, Research Triangle Park, North Carolina, September 1997. This document provides guidance on the use of triboelectric monitors as fabric filter bag leak detectors. The document includes fabric filter and monitoring system descriptions; guidance on monitor selection, installation, setup, adjustment, and operation; and quality assurance procedures. The document is available at *https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=2000D5T6.PDF.*

Additional information for the VCS search and determinations can be found

in the memorandum titled *Voluntary Consensus Standard Results for National Emission Standards for Hazardous Air Pollutants for Iron and Steel Manufacturing Facilities,* available in the docket for this final rule.

K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes that this action does not have disproportionately high and adverse human health or environmental effects on minority populations, low-income populations, and/or indigenous peoples, as specified in Executive Order 12898 (59 FR 7629, February 16, 1994). The documentation for this decision is included in sections III.A and IV.A of this preamble and the technical report titled *Risk and Technology Review—Analysis of Socio-Economic Factors for Populations Living Near Integrated Iron and Steel Manufacturing Facilities,* available in the docket for this final rule.

We examined the potential for any environmental justice issues that might be associated with the source category by performing a demographic analysis of the population close to the facilities. In this analysis, we evaluated the distribution of HAP-related cancer and noncancer risks from the NESHAP source category across different social, demographic, and economic groups within the populations living near facilities identified as having the highest risks. The methodology and the results of the demographic analyses are included in a technical report titled *Risk and Technology Review—Analysis of Socio-Economic Factors for Populations Living Near Integrated Iron and Steel Manufacturing Facilities* (Docket ID No. EPA–HQ–OAR–2002–0083).

The results of the source category demographic analysis for the NESHAP (point sources only) indicate that emissions expose approximately 60 people to a cancer risk at or above 10-in-1 million and none exposed to a chronic noncancer TOSHI greater than or equal to 1. The specific demographic results indicate that the overall percentage of the population potentially impacted by emissions is less than its corresponding national percentage for the minority population (37 percent for the source category compared to 38-percent nationwide). However, the ''African American'' population (29 percent for the source category compared to 12-percent nationwide) and the population ''Below the Poverty Level'' are greater than their corresponding national percentages. The proximity results (irrespective of risk) indicate that the population percentages for certain demographic categories within 5 km of source category emissions are greater than the corresponding national percentage for certain demographic groups including: ''African American,'' ''Ages 0 to 17,'' ''Over age 25 without a high school diploma,'' and ''Below the poverty level.''

The risks due to HAP emissions from this source category are acceptable for all populations. Furthermore, we do not expect this rule to achieve significant reductions in HAP emissions. Therefore, we conclude that this final rule will not have disproportionately high and adverse human health or environmental effects on minority or low-income populations because it does not affect the level of protection provided to human health or the environment. However, this final rule will provide additional benefits to these demographic groups by improving the compliance, monitoring, and implementation of the NESHAP.

L. Congressional Review Act (CRA)

This action is subject to the CRA, and the EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action is not a ''major rule'' as defined by 5 U.S.C. 804(2).

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedures, Air pollution control, Hazardous substances, Incorporation by reference, Intergovernmental relations, Reporting and recordkeeping requirements.

Andrew Wheeler,

Administrator.

For the reasons set forth in the preamble, the EPA amends 40 CFR part 63 as follows:

PART 63—NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart A—General Provisions

■ 2. Section 63.14 is amended by revising paragraphs (e)(1), (h)(106), and (n)(3) to read as follows:

§ 63.14 Incorporations by reference.

* * * * *

(e) * * *

(1) ANSI/ASME PTC 19.10–1981, Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus], issued August 31, 1981, IBR approved for §§ 63.309(k), 63.457(k), 63.772(e) and (h), 63.865(b), 63.997(e), 63.1282(d) and (g), 63.1625(b), table 5 to subpart EEEE, 63.3166(a), 63.3360(e), 63.3545(a), 63.3555(a), 63.4166(a), 63.4362(a), 63.4766(a), 63.4965(a), 63.5160(d), table 4 to subpart UUUU, table3 to subpart YYYY, 63.7822(b), 63.7824(e), 63.7825(b), 63.9307(c), 63.9323(a), 63.11148(e), 63.11155(e), 63.11162(f), 63.11163(g), 63.11410(j), 63.11551(a), 63.11646(a), and 63.11945, table 5 to subpart DDDDD, table 4 to subpart JJJJJ, table 4 to subpart KKKKK, tables 4 and 5 of subpart UUUUU, table 1 to subpart ZZZZZ, and table 4 to subpart JJJJJJ.

* * * * *

(h) * * *

(106) ASTM D7520–16, Standard Test Method for Determining the Opacity of a Plume in the Outdoor Ambient Atmosphere, approved April 1, 2016, IBR approved for §§ 63.1625(b), table 3 to subpart LLLLL, 63.7823(c) through (e), and 63.7833(g).

* * * * *

(n) * * *

(3) EPA–454/R–98–015, Office of Air Quality Planning and Standards (OAQPS), Fabric Filter Bag Leak Detection Guidance, September 1997, *https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=2000D5T6.pdf,* IBR approved for §§ 63.548(e), 63.864(e), 63.7525(j), 63.7831(f), 63.8450(e), 63.8600(e), and 63.11224(f).

* * * * *

Subpart FFFFF—[Amended]

■ 3. Section 63.7783 is amended by revising paragraphs (a) introductory text, (b), and (c) and adding paragraph (f) to read as follows:

§ 63.7783 When do I have to comply with this subpart?

(a) If you have an existing affected source, you must comply with each emission limitation, standard, and operation and maintenance requirement in this subpart that applies to you by the dates specified in paragraphs (a)(1) and (2) of this section. This paragraph does not apply to the emission limitations for mercury.

* * * * *

(b) If you have a new affected source and its initial startup date is on or before May 20, 2003, then you must comply with each emission limitation, standard, and operation and maintenance requirement in this subpart that applies to you by May 20, 2003. This paragraph does not apply to the emission limitations for mercury.

(c) If you have a new affected source and its initial startup date is after May 20, 2003, you must comply with each emission limitation, standard, and operation and maintenance requirement in this subpart that applies to you upon initial startup. This paragraph does not apply to the emission limitations for mercury.

* * * * *

(f) With regard to the mercury emission limitations, if you have a new or existing affected source, you must comply with each emission limitation for mercury that applies to you by the deadlines set forth in § 63.7791.

■ 4. The undesignated center heading before § 63.7790 is revised to read:

Emission Limitations and Standards

■ 5. Section 63.7791 is added before the undesignated center heading ''Operation and Maintenance Requirements'' to read as follows:

§ 63.7791 How do I comply with the requirements for the control of mercury?

(a) *Compliance deadlines.* (1) If you have an existing affected source or a new or reconstructed affected source for which construction or reconstruction commenced on or before August 16, 2019, each BOPF Group at your facility must be in compliance with the applicable mercury emission limit in Table 1 of this subpart through performance testing under §§ 63.7825 and 63.7833, or through procurement of steel scrap pursuant to the compliance options in § 63.7791(c), (d), or (e) beginning July 13, 2021.

(2) If you have a new or reconstructed affected source for which construction or reconstruction commenced after August 16, 2019, each BOPF Group at that source must be in compliance with the applicable mercury emission limit in Table 1 of this subpart beginning July 13, 2020 or upon initial startup of your affected source, whichever is later.

(b) *Alternative compliance demonstration.* (1) As an alternative to demonstrating compliance with the emission limits in Table 1 by conducting performance tests pursuant to §§ 63.7825 and 63.7833(h), you may demonstrate compliance with the emission limits in Table 1 by procuring scrap pursuant to the requirements in paragraph (c), (d), or (e) of this section for each scrap provider, contract, or shipment. It is not necessary to use the same BOPF scrap compliance provision for all scrap providers, contracts, or shipments. You may procure some scrap through providers, contracts, or shipments pursuant to one BOPF scrap compliance provision and other scrap through providers, contracts, or shipments pursuant to other BOPF scrap compliance provisions.

(2) To utilize the alternative compliance options established in paragraph (b)(1) of this section, you must submit an initial certification of compliance and semiannual compliance reports consistent with the requirements of §§ 63.7840(f) and 63.7841(b)(9) through (11), and (13), and comply with the recordkeeping requirements in § 63.7842(e) and all other applicable provisions related to demonstrating compliance through participating in an approved mercury program or through the use of scrap that does not contain mercury switches.

(3) For any facility that initially elects to utilize the alternative compliance options established in paragraph (b)(1) of this section, but subsequently stops using scrap that meets the requirements of paragraph (c), (d), or (e) of this section for each scrap provider, contract, or shipment, within 180 days of the change you must, for that BOPF Group, demonstrate compliance through performance testing pursuant to the requirements of §§ 63.7825 and 63.7833(h), and submit a revised notice of compliance status in your next semiannual compliance report described in this section. You must also comply with the requirements for conducting subsequent performance tests in §§ 63.7821(e) and 63.7840(g), and all other applicable requirements related to demonstrating compliance with the emission limits through performance testing.

(c) *Participation in the NVMSRP.* (1) You must obtain all post-consumer scrap that contains motor vehicle scrap from scrap providers who participate in the NVMSRP. The NVMSRP is an EPA-approved program under this section unless and until the Administrator disapproves the program (in part or in whole);

(2) You must certify in your initial notification of compliance status required by § 63.7840(f) and semiannual compliance report required by § 63.7841(a) that you purchased post-consumer steel scrap containing motor vehicle scrap according to paragraph (c)(1) of this section, and identify all your scrap providers in your semiannual compliance report;

(3) If you purchase scrap from a broker, you must certify that all scrap received from that broker was obtained from other scrap providers who participate in the NVMSRP and identify all scrap providers used by all your scrap brokers in your semiannual compliance report; and

(4) You must conduct periodic inspections or provide other means of corroboration to ensure that scrap providers and brokers participate in the NVMSRP and, therefore, are aware of the need for and are implementing appropriate steps to minimize the presence of mercury in scrap from end-of-life vehicles.

(d) *Use of scrap that does not contain mercury switches.* For BOPF scrap not complying with the requirements in paragraph (c) or (e) of this section, you must certify in your initial notification of compliance report required by § 63.7840(f) and semiannual compliance report required by § 63.7841(a) and maintain records of documentation required by § 63.7842(e) establishing that the scrap does not contain mercury switches. You may satisfy this requirement by certifying and documenting that:

(1) The scrap does not contain motor vehicle scrap; or

(2) The scrap does not contain shredded motor vehicle scrap; or

(3) The only materials from motor vehicles in the scrap are materials recovered for their specialty alloy content (including, but not limited to, chromium, nickel, molybdenum, or other alloys); therefore, based on the type of the scrap and purchase specifications, the scrap does not contain mercury switches.

(e) *Use of an EPA-approved mercury removal program.* (1) You must obtain all post-consumer scrap containing motor vehicle scrap from scrap providers who participate in a program for the removal of mercury switches that has been approved by the Administrator;

(2) You must certify in your initial notification of compliance status required by § 63.7840(f) and semiannual compliance report required by § 63.7841(a) that you purchase post-consumer steel scrap containing motor vehicle scrap according to paragraph (e)(1) of this section and identify all your scrap providers in your semiannual compliance report;

(3) If you purchase scrap from a broker, you must certify that all scrap received from that broker was obtained from other scrap providers who participate in a program for the removal of mercury switches that has been approved by the Administrator and identify all scrap providers used by all your scrap brokers in your semiannual compliance report; and

(4) You must conduct periodic inspections or provide other means of corroboration to ensure that scrap providers and brokers are complying with the approved mercury removal

program and, therefore, are aware of the need for and are implementing appropriate steps to minimize the presence of mercury in scrap from end-of-life vehicles.

■ 6. Section 63.7800 is amended by revising paragraph (a) to read as follows:

§ 63.7800 What are my operation and maintenance requirements?

(a) You must always operate and maintain your affected source, including air pollution control and monitoring equipment, according to the requirements in § 63.7810(d).

* * * * *

■ 7. Section 63.7810 is amended by revising paragraphs (a) and (c) and adding paragraph (d) to read as follows:

§ 63.7810 What are my general requirements for complying with this subpart?

(a) On or before January 11, 2021, for each existing source, and for each new or reconstructed source for which construction or reconstruction commenced on or before August 16, 2019, you must be in compliance with the emission limitations, standards, and operation and maintenance requirements in this subpart at all times, except during periods of startup, shutdown, and malfunction. After January 11, 2021, for each such source you must be in compliance with the emission limitations in this subpart at all times. For new and reconstructed sources for which construction or reconstruction commenced after August 16, 2019, you must be in compliance with the emission limitations in this subpart at all times.

* * * * *

(c) On or before January 11, 2021, for each existing source, and for each new or reconstructed source for which construction or reconstruction commenced on or before August 16, 2019, you must develop a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3). For each such source, a startup, shutdown, and malfunction plan is not required after January 11, 2021. No startup, shutdown, and malfunction plan is required for any new or reconstructed source for which construction or reconstruction commenced after August 16, 2019.

(d) On or before January 11, 2021, for each existing source, and for each new or reconstructed source for which construction or reconstruction commenced on or before August 16, 2019, you must always operate and maintain your affected source, including air pollution control and monitoring equipment, according to the provisions in § 63.6(e)(1)(i). After January 11, 2021for each such source, and after July 13, 2020 for new and reconstructed sources for which construction or reconstruction commenced after August 16, 2019, at all times, you must operate and maintain any affected source, including associated air pollution control equipment and monitoring equipment, in a manner consistent with safety and good air pollution control practices for minimizing emissions. The general duty to minimize emissions does not require you to make any further efforts to reduce emissions if levels required by the applicable standard have been achieved. Determination of whether a source is operating in compliance with operation and maintenance requirements will be based on information available to the Administrator which may include, but is not limited to, monitoring results, review of operation and maintenance procedures, review of operation and maintenance records, and inspection of the source.

■ 8. Section 63.7820 is amended by adding paragraph (e) to read as follows:

§ 63.7820 By what date must I conduct performance tests or other initial compliance demonstrations?

* * * * *

(e) Notwithstanding the deadlines in this section, existing and new affected sources must comply with the deadlines for making the initial compliance demonstrations for the mercury emission limit set forth in (e)(1) through (4) in this section.

(1) If you have an existing affected BOPF Group or a new or reconstructed affected source for which construction or reconstruction commenced on or before August 16, 2019, and you are demonstrating compliance with the emission limit in Table 1 through performance testing, you must conduct the initial performance test at your BOPF Group to demonstrate compliance with the mercury emission limit in Table 1 no later than July 13, 2021.

(2) If you have a new or reconstructed affected BOPF Group for which construction or reconstruction commenced after August 16, 2019, and you are demonstrating compliance with the emission limit in Table 1 through performance testing, you must conduct the initial performance test at your BOPF Group to demonstrate compliance with the mercury emission limit in Table 1 within 180 days of July 13, 2020 or within 180 days of initial startup of your affected source, whichever is later.

(3) If you have an existing affected BOPF Group or a new or reconstructed affected source for which construction or reconstruction commenced on or before August 16, 2019, and you are demonstrating compliance with the mercury emission limit in Table 1 through the requirements in § 63.7791(c) through (e), you must certify compliance in accordance with § 63.7840(f) in your notification of compliance and in accordance with § 63.7841(b)(11) in your first semiannual compliance report after July 13, 2021.

(4) If you have a new affected BOPF Group or a new or reconstructed affected source for which construction or reconstruction commenced after August 16, 2019, and you are demonstrating compliance with the mercury emission limit in Table 1 through the requirements in § 63.7791(b) through (d), you must certify compliance in accordance with § 63.7840(f) in your initial notification of compliance and in accordance with § 63.7841(b)(11) in your first semiannual compliance report after July 13, 2021 or after initial startup of your BOPF Group, whichever is later.

■ 9. Section 63.7821 is amended by revising paragraph (a) and adding paragraph (e) to read as follows:

§ 63.7821 When must I conduct subsequent performance tests?

(a) You must conduct subsequent performance tests to demonstrate compliance with all applicable emission and opacity limits in Table 1 to this subpart at the frequencies specified in paragraphs (b) through (e) of this section.

* * * * *

(e) For each BOPF Group, if demonstrating compliance with the mercury emission limit in Table 1 to this subpart through performance testing under §§ 63.7825 and 63.7833, you must conduct subsequent performance tests twice per permit cycle (*i.e.,* mid-term and initial/final) for sources with title V operating permits, and every 2.5 years for sources without a title V operating permit, at the outlet of the control devices for the BOPF Group.

■ 10. Section 63.7822 is amended by revising paragraphs (a) and (b)(1) to read as follows:

§ 63.7822 What test methods and other procedures must I use to demonstrate initial compliance with the emission limits for particulate matter?

(a) On or before January 11, 2021, for each existing source, and for each new or reconstructed source for which construction or reconstruction commenced on or before August 16, 2019, you must conduct each performance test that applies to your

affected source based on representative performance (*i.e.,* performance based on normal operating conditions) of the affected source for the period being tested, according to the conditions detailed in paragraphs (b) through (i) of this section. After January 11, 2021 for each such source, and after July 13, 2020 for new and reconstructed sources for which construction or reconstruction commenced after August 16, 2019, you must conduct each performance test under conditions representative of normal operations. The owner or operator must record the process information that is necessary to document operating conditions during the test and include in such record an explanation to support that such conditions represent normal operation. Upon request, the owner or operator shall make available to the Administrator such records as may be necessary to determine the conditions of performance tests. Representative conditions exclude periods of startup and shutdown. You shall not conduct performance tests during periods of malfunction. You must record the process information that is necessary to document operating conditions during the test and include in such record an explanation to support that such conditions represent normal operation. Upon request, you shall make available to the Administrator such records as may be necessary to determine the conditions of performance tests.

(b) * * *

(1) Determine the concentration of particulate matter according to the following test methods:

(i) EPA Method 1 in appendix A–1 to part 60 of this chapter to select sampling port locations and the number of traverse points. Sampling ports must be located at the outlet of the control device and prior to any releases to the atmosphere.

(ii) EPA Method 2 or 2F in appendix A–1 to part 60 of this chapter or EPA Method 2G in appendix A–2 to part 60 of this chapter to determine the volumetric flow rate of the stack gas.

(iii) EPA Method 3, 3A, or 3B in appendix A–2 to part 60 of this chapter to determine the dry molecular weight of the stack gas. The manual procedures (but not instrumental procedures) of voluntary consensus standard ANSI/ASME PTC 19.10–1981—Part 10 (incorporated by reference—see § 63.14) may be used as an alternative to EPA Method 3B.

(iv) EPA Method 4 in appendix A–3 to part 60 of this chapter to determine the moisture content of the stack gas.

(v) EPA Method 5 or 5D in appendix A–3 to part 60 of this chapter or EPA Method 17 in appendix A–6 to part 60 of this chapter, as applicable, to determine the concentration of particulate matter (front half filterable catch only).

* * * * *

■ 11. Section 63.7823 is amended by revising paragraphs (a), (c)(1), (d)(1)(i), (d)(2)(i), and (e)(1) and (3) to read as follows:

§ 63.7823 What test methods and other procedures must I use to demonstrate initial compliance with the opacity limits?

(a) You must conduct each performance test that applies to your affected source based on representative performance (*i.e.,* performance based on normal operating conditions) of the affected source for the period being tested, according to the conditions detailed in paragraphs (b) through (d) of this section. Representative conditions exclude periods of startup and shutdown. You shall not conduct performance tests during periods of malfunction. You must record the process information that is necessary to document operating conditions during the test and include in such record an explanation to support that such conditions represent normal operation. Upon request, you shall make available to the Administrator such records as may be necessary to determine the conditions of performance tests.

* * * * *

(c) * * *

(1) Using a certified observer, determine the opacity of emissions according to EPA Method 9 in appendix A–4 to part 60 of this chapter. Alternatively, ASTM D7520–16, (incorporated by reference, see § 63.14) may be used with the following conditions:

(i) During the digital camera opacity technique (DCOT) certification procedure outlined in Section 9.2 of ASTM D7520–16 (incorporated by reference, see § 63.14), the owner or operator or the DCOT vendor must present the plumes in front of various backgrounds of color and contrast representing conditions anticipated during field use such as blue sky, trees, and mixed backgrounds (clouds and/or a sparse tree stand).

(ii) The owner or operator must also have standard operating procedures in place including daily or other frequency quality checks to ensure the equipment is within manufacturing specifications as outlined in Section 8.1 of ASTM D7520–16 (incorporated by reference, see § 63.14).

(iii) The owner or operator must follow the recordkeeping procedures outlined in § 63.10(b)(1) for the DCOT certification, compliance report, data sheets, and all raw unaltered JPEGs used for opacity and certification determination.

(iv) The owner or operator or the DCOT vendor must have a minimum of four independent technology users apply the software to determine the visible opacity of the 300 certification plumes. For each set of 25 plumes, the user may not exceed 15-percent opacity of anyone reading and the average error must not exceed 7.5-percent opacity.

(v) Use of this approved alternative does not provide or imply a certification or validation of any vendor's hardware or software. The onus to maintain and verify the certification and/or training of the DCOT camera, software, and operator in accordance with ASTM D7520–16 (incorporated by reference, see § 63.14) and these requirements is on the facility, DCOT operator, and DCOT vendor.

* * * * *

(d) * * *

(1) * * *

(i) Using a certified observer, determine the opacity of emissions according to EPA Method 9 in appendix A–4 to part 60 of this chapter except as specified in paragraphs (d)(1)(ii) and (iii) of this section. Alternatively, ASTM D7520–16 (incorporated by reference, see § 63.14) may be used with the following conditions:

(A) During the DCOT certification procedure outlined in Section 9.2 of ASTM D7520–16 (incorporated by reference, see § 63.14), the owner or operator or the DCOT vendor must present the plumes in front of various backgrounds of color and contrast representing conditions anticipated during field use such as blue sky, trees, and mixed backgrounds (clouds and/or a sparse tree stand).

(B) The owner or operator must also have standard operating procedures in place including daily or other frequency quality checks to ensure the equipment is within manufacturing specifications as outlined in Section 8.1 of ASTM D7520–16 (incorporated by reference, see § 63.14).

(C) The owner or operator must follow the recordkeeping procedures outlined in § 63.10(b)(1) for the DCOT certification, compliance report, data sheets, and all raw unaltered JPEGs used for opacity and certification determination.

(D) The owner or operator or the DCOT vendor must have a minimum of four independent technology users apply the software to determine the visible opacity of the 300 certification

plumes. For each set of 25 plumes, the user may not exceed 15-percent opacity of anyone reading and the average error must not exceed 7.5-percent opacity.

(E) Use of this approved alternative does not provide or imply a certification or validation of any vendor's hardware or software. The onus to maintain and verify the certification and/or training of the DCOT camera, software, and operator in accordance with ASTM D7520–16 (incorporated by reference, see § 63.14) and these requirements is on the facility, DCOT operator, and DCOT vendor.

* * * * *

(2) * * *

(i) Using a certified observer, determine the opacity of emissions according to EPA Method 9 in appendix A–4 to part 60 of this chapter. Alternatively, ASTM D7520–16 (incorporated by reference, see § 63.14) may be used with the following conditions:

(A) During the DCOT certification procedure outlined in Section 9.2 of ASTM D7520–16 (incorporated by reference, see § 63.14), the owner or operator or the DCOT vendor must present the plumes in front of various backgrounds of color and contrast representing conditions anticipated during field use such as blue sky, trees, and mixed backgrounds (clouds and/or a sparse tree stand).

(B) The owner or operator must also have standard operating procedures in place including daily or other frequency quality checks to ensure the equipment is within manufacturing specifications as outlined in Section 8.1 of ASTM D7520–16 (incorporated by reference, see § 63.14).

(C) The owner or operator must follow the recordkeeping procedures outlined in § 63.10(b)(1) for the DCOT certification, compliance report, data sheets, and all raw unaltered JPEGs used for opacity and certification determination.

(D) The owner or operator or the DCOT vendor must have a minimum of four independent technology users apply the software to determine the visible opacity of the 300 certification plumes. For each set of 25 plumes, the user may not exceed 15-percent opacity of anyone reading and the average error must not exceed 7.5-percent opacity.

(E) Use of this approved alternative does not provide or imply a certification or validation of any vendor's hardware or software. The onus to maintain and verify the certification and/or training of the DCOT camera, software, and operator in accordance with ASTM D7520–16 (incorporated by reference, see § 63.14) and these requirements is on the facility, DCOT operator, and DCOT vendor.

* * * * *

(e) * * *

(1) Using a certified observer, determine the opacity of emissions according to EPA Method 9 in appendix A–4 to part 60 of this chapter. Alternatively, ASTM D7520–16 (incorporated by reference, see § 63.14) may be used with the following conditions:

(i) During the DCOT certification procedure outlined in Section 9.2 of ASTM D7520–16 (incorporated by reference, see § 63.14), the owner or operator or the DCOT vendor must present the plumes in front of various backgrounds of color and contrast representing conditions anticipated during field use such as blue sky, trees, and mixed backgrounds (clouds and/or a sparse tree stand).

(ii) The owner or operator must also have standard operating procedures in place including daily or other frequency quality checks to ensure the equipment is within manufacturing specifications as outlined in Section 8.1 of ASTM D7520–16 (incorporated by reference, see § 63.14).

(iii) The owner or operator must follow the recordkeeping procedures outlined in § 63.10(b)(1) for the DCOT certification, compliance report, data sheets, and all raw unaltered JPEGs used for opacity and certification determination.

(iv) The owner or operator or the DCOT vendor must have a minimum of four independent technology users apply the software to determine the visible opacity of the 300 certification plumes. For each set of 25 plumes, the user may not exceed 15-percent opacity of anyone reading and the average error must not exceed 7.5-percent opacity.

(v) Use of this approved alternative does not provide or imply a certification or validation of any vendor's hardware or software. The onus to maintain and verify the certification and/or training of the DCOT camera, software, and operator in accordance with ASTM D7520–16 (incorporated by reference, see § 63.14) and these requirements is on the facility, DCOT operator, and DCOT vendor.

* * * * *

(3) Make visible emission observations of uncovered portions of sinter plant coolers with the line of sight generally in the direction of the center of the cooler.

■ 12. Section 63.7824 is amended by revising paragraphs (e) introductory text and (e)(1) and (2) and the defined term ''M_c'' in Equation 1 in paragraph (e)(3) to read as follows:

§ 63.7824 What test methods and other procedures must I use to establish and demonstrate initial compliance with operating limits?

* * * * *

(e) To demonstrate initial compliance with the alternative operating limit for volatile organic compound emissions from the sinter plant windbox exhaust stream in § 63.7790(d)(2), follow the test methods and procedures in paragraphs (e)(1) through (5) of this section. You must conduct each performance test that applies to your affected source based on representative performance (*i.e.,* performance based on normal operating conditions) of the affected source for the period being tested. Representative conditions exclude periods of startup and shutdown. You shall not conduct performance tests during periods of malfunction. You must record the process information that is necessary to document operating conditions during the test and include in such record an explanation to support that such conditions represent normal operation. Upon request, you shall make available to the Administrator such records as may be necessary to determine the conditions of performance tests.

(1) Determine the volatile organic compound emissions according to the following test methods:

(i) EPA Method 1 in appendix A–1 to part 60 of this chapter to select sampling port locations and the number of traverse points. Sampling ports must be located at the outlet of the control device and prior to any releases to the atmosphere.

(ii) EPA Method 2 or 2F in appendix A–1 to part 60 of this chapter or EPA Method 2G in appendix A–2 to part 60 of this chapter to determine the volumetric flow rate of the stack gas.

(iii) EPA Method 3, 3A, or 3B in appendix A–2 to part 60 of this chapter to determine the dry molecular weight of the stack gas. The manual procedures (but not instrumental procedures) of voluntary consensus standard ANSI/ASME PTC 19.10–1981—Part 10 (incorporated by reference—see § 63.14) may be used as an alternative to EPA Method 3B.

(iv) EPA Method 4 in appendix A–3 to part 60 of this chapter to determine the moisture content of the stack gas.

(v) EPA Method 25 in appendix A–7 to part 60 of this chapter to determine the mass concentration of volatile organic compound emissions (total gaseous nonmethane organics as carbon) from the sinter plant windbox exhaust stream stack.

(2) Determine volatile organic compound (VOC) emissions every 24 hours (from at least three samples taken at 8-hour intervals) using EPA Method 25 in appendix A–7 to part 60 of this chapter. Record the sampling date and time, sampling results, and sinter produced (tons/day).

(3) * * *

M_c = Average concentration of total gaseous nonmethane organics as carbon by EPA Method 25 in appendix A–7 to part 60 of this chapter, milligrams per dry standard cubic meters (mg/dscm) for each day;

* * * * *

§§ 63.7825 and 63.7826 [Redesignated as §§ 63.7826 and 63.7827]

■ 13. Sections 63.7825 and 63.7826 are redesignated as §§ 63.7826 and 63.7827, respectively, and a new § 63.7825 is added to read as follows:

§ 63.7825 What test methods and other procedures must I use to demonstrate initial compliance with the emission limit for mercury?

(a) If demonstrating compliance with the mercury emission limits for each BOPF Group in Table 1 to this subpart through performance testing, you must conduct a performance test to demonstrate initial compliance with the emission limit. If demonstrating compliance with the emission limit through performance testing, you must conduct each performance test that applies to your affected source based on representative performance (*i.e.,* performance based on normal operating conditions) of the affected source for the period being tested, according to the conditions detailed in paragraphs (b) through (f) of this section. Representative conditions exclude periods of startup and shutdown. You shall not conduct performance tests during periods of malfunction. Initial compliance tests must be conducted by the deadlines in § 63.7820(e).

(1) You must record the process information that is necessary to document operating conditions during the test and include in such record an explanation to support that such conditions represent normal operation. Upon request, you shall make available to the Administrator such records as may be necessary to determine the conditions of performance tests.

(2) For sources with multiple emission units ducted to a common control device and stack, compliance testing must be performed either by conducting a single compliance test with all affected emissions units in operation or by conducting a separate compliance test on each emissions unit. Alternatively, the owner or operator may request approval from the permit authority for an alternative testing approach. If the units are tested separately, any emissions unit that is not tested initially must be tested as soon as is practicable.

(b) To demonstrate compliance with the emission limit for mercury in Table 1 to this subpart through performance testing, follow the test methods and procedures in paragraphs (b)(1) and (2) of this section.

(1) Determine the concentration of mercury according to the following test methods:

(i) EPA Method 1 in appendix A–1 to part 60 of this chapter to select sampling port locations and the number of traverse points. Sampling ports must be located at the outlet of the control device and prior to any releases to the atmosphere.

(ii) EPA Method 2 or 2F in appendix A–1 to part 60 of this chapter or EPA Method 2G in appendix A–2 to part 60 of this chapter to determine the volumetric flow rate of the stack gas.

(iii) EPA Method 3, 3A, or 3B in appendix A–2 to part 60 of this chapter to determine the dry molecular weight of the stack gas. The manual procedures (but not instrumental procedures) of voluntary consensus standard ANSI/ASME PTC 19.10–1981—Part 10 (incorporated by reference—see § 63.14) may be used as an alternative to EPA Method 3B.

(iv) EPA Method 4 in appendix A–3 to part 60 of this chapter to determine the moisture content of the stack gas.

(v) EPA Method 29 or 30B in appendix A–8 to part 60 of this chapter to determine the concentration of mercury from each unit of the BOPF Group exhaust stream stack. If performing measurements using EPA Method 29, you must collect a minimum sample volume of 1.7 dscm (60 dscf). Alternative test methods may be considered on a case-by-case basis per § 63.7(f).

(2) Three valid test runs are needed to comprise a performance test of each BOPF Group unit. If the performance testing results for any of the emission points yields a non-detect value, then the minimum detection limit (MDL) must be used to calculate the mass emissions (lb) for that emission unit and, in turn, for calculating the sum of the emissions (in units of pounds of mercury per ton of steel scrap) for all BOPF Group units subject to the emission standard for determining compliance. If the resulting mercury emissions are greater than the MACT emission standard, the owner or operator may use procedures that produce lower MDL results and repeat the mercury performance testing one additional time for any emission point for which the measured result was below the MDL. If this additional testing is performed, the results from that testing must be used to determine compliance (*i.e.,* there are no additional opportunities allowed to lower the MDL).

(3) For a primary emission control device applied to emissions from a BOPF with a closed hood system, sample only during the primary oxygen blow and do not sample during any subsequent reblows. Continue sampling for each run for an integral number of primary oxygen blows.

(4) For a primary emission control system applied to emissions from a BOPF with an open hood system and for a control device applied solely to secondary emissions from a BOPF, you must complete the requirements of paragraphs (b)(4)(i) and (ii) of this section:

(i) Sample only during the steel production cycle. Conduct sampling under conditions that are representative of normal operation. Record the start and end time of each steel production cycle and each period of abnormal operation; and

(ii) Sample for an integral number of steel production cycles. The steel production cycle begins when the scrap is charged to the furnace and ends 3 minutes after the slag is emptied from the vessel into the slag pot.

(5) For a control device applied to emissions from BOPF shop ancillary operations (hot metal transfer, skimming, desulfurization, or ladle metallurgy), sample only when the operation(s) is being conducted.

(c) Calculate the mercury mass emissions, based on the average of three test run values, for each BOPF Group unit (or combination of units that are ducted to a common stack and are tested when all affected sources are operating pursuant to paragraph (a) of this section) using Equation 1 of this section as follows:

$$E = \frac{C_s \times Q \times t}{454{,}000 \times 35.31} \quad \text{(Eq. 1)}$$

Where:

E = Mass emissions of mercury, pounds (lb);

C_s = Concentration of mercury in stack gas, mg/dscm;

454,000 = Conversion factor (mg/lb);

Q = Volumetric flow rate of stack gas, dscf/min;

35.31 = Conversion factor (dscf/dscm); and

t = Duration of test, minutes.

(d) You must install, calibrate, maintain, and operate an appropriate

weight measurement device, to measure the tons of steel scrap input to the BOPF cycle simultaneous with each BOPF Group unit's stack test.

(e) You must maintain the systems for measuring weight within ±5 percent accuracy. You must describe the specific equipment used to make measurements at your facility and how that equipment is periodically calibrated. You must also explain, document, and maintain written procedures for determining the accuracy of the measurements and make these written procedures available to your permitting authority upon request. You must determine, record, and maintain a record of the accuracy of the measuring systems before the beginning of your initial compliance test and during each subsequent quarter of affected source operation.

(f) Calculate the emissions from each new and existing affected source in pounds of mercury per ton of steel scrap to determine initial compliance with the mercury emission limit in Table 1. Sum the mercury mass emissions (in pounds) from all BOPF Group units calculated using Equation 1 of this section. Divide that sum by the sum of the total amount of steel scrap charged to the BOPFs (in tons).

■ 14. Section 63.7831 is amended by revising paragraphs (a)(4) through (6) and (f)(4) to read as follows:

§ 63.7831 What are the installation, operation, and maintenance requirements for my monitors?

(a) * * *

(4) On or before January 11, 2021, for each existing source, and for each new or reconstructed source for which construction or reconstruction commenced on or before August 16, 2019, ongoing operation and maintenance procedures in accordance with the general requirements of § 63.8(c)(1)(ii), (c)(3), (c)(4)(ii), and (c)(7) and (8). After January 11, 2021 for each such source, and after July 13, 2020 for new and reconstructed sources for which construction or reconstruction commenced after August 16, ongoing operation and maintenance procedures in accordance with the general requirements of § 63.8(c)(1)(ii), (c)(3), (c)(4)(ii), and (c)(7) and (8);

(5) On or before January 11, 2021, for each existing source, and for each new or reconstructed source for which construction or reconstruction commenced on or before August 16, 2019, ongoing data quality assurance procedures in accordance with the general requirements of § 63.8(d). After January 11, 2021 for each such source, and after July 13, 2020 for new and reconstructed sources for which construction or reconstruction commenced after August 16, 2019, ongoing data quality assurance procedures in accordance with the general requirements of § 63.8(d) except for the requirements related to startup, shutdown, and malfunction plans referenced in § 63.8(d)(3). The owner or operator shall keep these written procedures on record for the life of the affected source or until the affected source is no longer subject to the provisions of this part, to be made available for inspection, upon request, by the Administrator. If the performance evaluation plan is revised, the owner or operator shall keep previous (*i.e.,* superseded) versions of the performance evaluation plan on record to be made available for inspection, upon request, by the Administrator, for a period of 5 years after each revision to the plan. The program of corrective action should be included in the plan required under § 63.8(d)(2);

(6) On or before January 11, 2021, for each existing source, and for each new or reconstructed source for which construction or reconstruction commenced on or before August 16, 2019, ongoing recordkeeping and reporting procedures in accordance with the general requirements of § 63.10(c)(1) through (14), (e)(1), and (e)(2)(i). After January 11, 2021 for each such source, and after July 13, 2020 for new and reconstructed sources for which construction or reconstruction commenced after August 16, 2019, ongoing recordkeeping and reporting procedures in accordance with the general requirements of § 63.10(c)(1) through (14), (e)(1), and (e)(2)(i);

* * * * *

(f) * * *

(4) Each system that works based on the triboelectric effect must be installed, operated, and maintained in a manner consistent with the guidance document, ''Fabric Filter Bag Leak Detection Guidance,'' EPA–454/R–98–015 (incorporated by reference, see § 63.14). You may install, operate, and maintain other types of bag leak detection systems in a manner consistent with the manufacturer's written specifications and recommendations.

* * * * *

■ 15. Section 63.7833 is amended by revising paragraph (g)(3) and adding paragraphs (h) and (i) to read as follows:

§ 63.7833 How do I demonstrate continuous compliance with the emission limitations that apply to me?

* * * * *

(g) * * *

(3) For purposes of paragraphs (g)(1) and (2) of this section, in the case of an exceedance of the hourly average opacity operating limit for an electrostatic precipitator, measurements of the hourly average opacity based on visible emission observations in accordance with EPA Method 9 (in appendix A–4 to part 60) may be taken to evaluate the effectiveness of corrective action. ASTM D7520–16 (incorporated by reference, see § 63.14) may be used with the following conditions:

(i) During the DCOT certification procedure outlined in Section 9.2 of ASTM D7520–16 (incorporated by reference, see § 63.14), the owner or operator or the DCOT vendor must present the plumes in front of various backgrounds of color and contrast representing conditions anticipated during field use such as blue sky, trees, and mixed backgrounds (clouds and/or a sparse tree stand).

(ii) The owner or operator must also have standard operating procedures in place including daily or other frequency quality checks to ensure the equipment is within manufacturing specifications as outlined in Section 8.1 of ASTM D7520–16 (incorporated by reference, see § 63.14).

(iii) The owner or operator must follow the recordkeeping procedures outlined in § 63.10(b)(1) for the DCOT certification, compliance report, data sheets, and all raw unaltered JPEGs used for opacity and certification determination.

(iv) The owner or operator or the DCOT vendor must have a minimum of four independent technology users apply the software to determine the visible opacity of the 300 certification plumes. For each set of 25 plumes, the user may not exceed 15-percent opacity of anyone reading and the average error must not exceed 7.5-percent opacity.

(v) Use of this approved alternative does not provide or imply a certification or validation of any vendor's hardware or software. The onus to maintain and verify the certification and/or training of the DCOT camera, software, and operator in accordance with ASTM D7520–16 (incorporated by reference, see § 63.14) and these requirements is on the facility, DCOT operator, and DCOT vendor.

* * * * *

(h) If you are demonstrating compliance with the mercury emission limits in Table 1 of this section for your BOPF Groups through performance testing, you must conduct mercury performance tests in accordance with §§ 63.7821(e) and 63.7825 and calculate

the emissions from each new and existing affected source in pounds of mercury per ton of steel scrap to determine compliance with the mercury emission limits in Table 1. Sum the mercury mass emissions (in pounds) from all BOPF Group units calculated using Equation 1 of § 63.7825. Divide that sum by the sum of the total amount of steel scrap charged to the BOPFs (in tons).

(i) If you are demonstrating compliance with the mercury emission limits in Table 1 of this section for your BOPF Groups by certifying participation in the NVMSRP or another EPA-approved mercury program, or by using scrap that does not contain mercury switches, you must obtain and certify your use of steel scrap per § 63.7791(c), (d), or (e), as applicable, and § 63.7841(b)(11) to demonstrate continuous compliance with the standard.

■ 16. Section 63.7835 is revised to read as follows:

§ 63.7835 What other requirements must I meet to demonstrate continuous compliance?

Except as provided in § 63.7833(g), you must report each instance in which you did not meet each emission limitation in § 63.7790 that applies to you. This includes periods of startup, shutdown, and malfunction. You also must report each instance in which you did not meet each operation and maintenance requirement in § 63.7800 that applies to you. These instances are deviations from the emission limitations and operation and maintenance requirements in this subpart. These deviations must be reported according to the requirements in § 63.7841.

(a) In the event that an affected unit fails to meet an applicable standard, record the date, time, and duration of each failure.

(b) For each failure to meet an applicable standard, record and retain a list of the affected sources or equipment, an estimate of the quantity of each regulated pollutant emitted over any emission limit and a description of the method used to estimate the emissions.

(c) Record actions taken to minimize emissions in accordance with § 63.7810(d), and any corrective actions taken to return the affected unit to its normal or usual manner of operation.

(d) For existing sources and for new or reconstructed sources which commenced construction or reconstruction on or before August 16, 2019, before January 11, 2021, consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). The Administrator will determine whether deviations that occur during a period of startup, shutdown, or malfunction are violations, according to the provisions in § 63.6(e). After January 11, 2021 for such sources, and after July 13, 2020 for new and reconstructed sources which commence construction or reconstruction after August 16, 2019, the exemptions for periods of startup, shutdown, and malfunction in § 63.6(e) no longer apply.

■ 17. Section 63.7840 is amended by revising paragraphs (d), (e) introductory text, and (e)(2) and adding paragraphs (f) through (h) to read as follows:

§ 63.7840 What notifications must I submit and when?

* * * * *

(d) If you are required to conduct a performance test, you must submit a notification of intent to conduct a performance test at least 60 calendar days before the performance test is scheduled to begin as required in § 63.7(b)(1). For the first mercury compliance test in the BOPF Group for anyone sequence of tests, you must include a schedule of all subsequent tests in the BOPF Group in the test series.

(e) If you are required to conduct a performance test, opacity observation, or other initial compliance demonstration, you must submit a notification of compliance according to § 63.9(h)(2)(ii), except that for the purposes of submitting the notification of compliance status for BOPF Group mercury testing, the performance test shall be considered complete when the final unit or control device in the BOPF Group in the sequence is tested.

* * * * *

(2) For each initial compliance demonstration that includes a performance test, you must submit the notification of compliance status, including the summary of performance test results, before the close of business on the 60th calendar day following the completion of the performance test according to § 63.10(d)(2).

(f) The notification of compliance status required by §§ 63.9(b) and (h) and 63.7826(c) must include each applicable certification of compliance, signed by a responsible official, in paragraphs (f)(1) and (2) of this section, regarding the mercury requirements, as applicable, in § 63.7791(c) through (e).

(1) ''This facility participates in and purchases scrap only from scrap providers who participate in a program for removal of mercury switches that has been approved by the EPA Administrator, in accordance with § 63.7791(c) or (e)''; or

(2) ''This facility complies with the requirements for scrap that does not contain mercury switches, in accordance with § 63.7791(d).''

(g) Within 60 calendar days after the date of completing each performance test required by this subpart, you must submit the results of the performance test following the procedures specified in paragraphs (g)(1) through (3) of this section. Where applicable, you may assert a claim of EPA system outage, in accordance with § 63.7841(e), or force majeure, in accordance with § 63.7841(f), for failure to timely comply with this requirement.

(1) Data collected using test methods supported by EPA's Electronic Reporting Tool (ERT) as listed on EPA's ERT website (*https://www.epa.gov/electronic-reporting-air-emissions/electronic-reporting-tool-ert*) at the time of the test. Submit the results of the performance test to the EPA via the Compliance and Emissions Data Reporting Interface (CEDRI), which can be accessed through EPA's Central Data Exchange (CDX) (*https://cdx.epa.gov/*). The data must be submitted in a file format generated through the use of EPA's ERT. Alternatively, you may submit an electronic file consistent with the extensible markup language (XML) schema listed on EPA's ERT website.

(2) Data collected using test methods that are not supported by EPA's ERT as listed on EPA's ERT website at the time of the test. The results of the performance test must be included as an attachment in the ERT or an alternate electronic file consistent with the XML schema listed on EPA's ERT website. Submit the ERT generated package or alternative file to the EPA via CEDRI.

(3) Confidential business information (CBI). If you claim some of the information submitted under paragraph (g) of this section is CBI, you must submit a complete file, including information claimed to be CBI, to the EPA. The file must be generated through the use of EPA's ERT or an alternate electronic file consistent with the XML schema listed on EPA's ERT website. Submit the file on a compact disc, flash drive, or other commonly used electronic storage medium and clearly mark the medium as CBI. Mail the electronic medium to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404–02, 4930 Old Page Rd., Durham, NC 27703. The same file with the CBI omitted must be submitted to the EPA via EPA's CDX as described in paragraph (g) of this section.

(h) Within 60 calendar days after the date of completing each continuous monitoring system (CMS) performance evaluation (as defined in § 63.2), you must submit the results of the performance evaluation following the procedures specified in paragraphs (h)(1) through (3) of this section. Where applicable, you may assert a claim of EPA system outage, in accordance with § 63.7841(e), or force majeure, in accordance with § 63.7841(f), for failure to timely comply with this requirement.

(1) Performance evaluations of CMS measuring relative accuracy test audit (RATA) pollutants that are supported by EPA's ERT as listed on EPA's ERT website at the time of the evaluation. Submit the results of the performance evaluation to the EPA via CEDRI, which can be accessed through EPA's CDX. The data must be submitted in a file format generated through the use of EPA's ERT. Alternatively, you may submit an electronic file consistent with the XML schema listed on EPA's ERT website.

(2) Performance evaluations of CMS measuring RATA pollutants that are not supported by EPA's ERT as listed on EPA's ERT website at the time of the evaluation. The results of the performance evaluation must be included as an attachment in the ERT or an alternate electronic file consistent with the XML schema listed on EPA's ERT website. Submit the ERT generated package or alternative file to the EPA via CEDRI.

(3) Confidential business information (CBI). If you claim some of the information submitted under this paragraph (h) is CBI, you must submit a complete file, including information claimed to be CBI, to the EPA. The file must be generated through the use of EPA's ERT or an alternate electronic file consistent with the XML schema listed on EPA's ERT website. Submit the file on a compact disc, flash drive, or other commonly used electronic storage medium and clearly mark the medium as CBI. Mail the electronic medium to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404–02, 4930 Old Page Rd., Durham, NC 27703. The same file with the CBI omitted must be submitted to the EPA via EPA's CDX as described in this paragraph (h).

■ 18. Section 63.7841 is amended by:

■ a. Revising paragraphs (b) introductory text, (b)(4), (b)(7) introductory text, (b)(7)(ii), (b)(8) introductory text, and (b)(8)(ii), (iv), and (vi);

■ b. Adding paragraphs (b)(9) through (13);

■ c. Revising paragraph (c);

■ d. Redesignating paragraph (d) as paragraph (g) and revising it; and

■ e. Adding new paragraph (d) and paragraphs (e) and (f).

The revisions and additions read as follows:

§ 63.7841 What reports must I submit and when?

* * * * *

(b) *Compliance report contents.* Each compliance report must include the information in paragraphs (b)(1) through (3) of this section and, as applicable, paragraphs (b)(4) through (13) of this section.

* * * * *

(4) For existing sources and for new or reconstructed sources for which construction or reconstruction commenced on or before August 16, 2019, before January 11, 2021, if you had a startup, shutdown, or malfunction during the reporting period and you took actions consistent with your startup, shutdown, and malfunction plan, the compliance report must include the information in § 63.10(d)(5)(i). A startup, shutdown, and malfunction plan and the information in § 63.10(d)(5)(i) is not required after January 11, 2021.

* * * * *

(7) For each deviation from an emission limitation in § 63.7790 that occurs at an affected source where you are not using a continuous monitoring system (including a CPMS, COMS, or CEMS) to comply with an emission limitation in this subpart, the compliance report must contain the information in paragraphs (b)(1) through (4) of this section, the information in paragraphs (b)(7)(i) and (ii) of this section, and the information in (b)(13) of this section. This includes periods of startup, shutdown, and malfunction.

* * * * *

(ii) Information on the duration and cause of deviations (including unknown cause, if applicable) as applicable and the corrective action taken.

* * * * *

(8) For each deviation from an emission limitation occurring at an affected source where you are using a continuous monitoring system (including a CPMS or COMS) to comply with the emission limitation in this subpart, you must include the information in paragraphs (b)(1) through (4) of this section, the information in paragraphs (b)(8)(i) through (xi) of this section, and the information in (b)(13) of this section. This includes periods of malfunction.

* * * * *

(ii) The date, time, and duration that each continuous monitoring was inoperative, except for zero (low-level) and high-level checks.

* * * * *

(iv) The date and time that each deviation started and stopped, and whether each deviation occurred during a malfunction or during another period.

* * * * *

(vi) A breakdown of the total duration of the deviations during the reporting period including those that are due to control equipment problems, process problems, other known causes, and other unknown causes.

* * * * *

(9) Any deviation from the requirements in § 63.7791 and the corrective action taken. For each deviation, you must include the information in (b)(13) of this section.

(10) If there were no deviations from the requirements in § 63.7791, a statement that there were no deviations from the requirements during the reporting period.

(11) If the facility demonstrates compliance with the mercury emission limits in Table 1 through the compliance options in § 63.7791(c), (d), or (e), the report must contain the applicable statement in paragraphs (b)(11)(i) and (ii) of this section, as applicable.

(i) ''This facility participates in and purchases scrap only from scrap providers who participate in a program for removal of mercury switches that has been approved by the EPA Administrator, in accordance with § 63.7791(c) or (e)''; or

(ii) ''This facility complies with the requirements for scrap that does not contain mercury switches, in accordance with § 63.7791(d).''

(12) For existing sources and for new or reconstructed sources which commenced construction or reconstruction on or before August 16, 2019, before January 11, 2021, for each startup, shutdown, or malfunction during the reporting period that is not consistent with your startup, shutdown, and malfunction plan you must submit an immediate startup, shutdown and malfunction report. Unless the Administrator has approved a different schedule for submission of reports under § 63.10(a), you must submit each report according to paragraphs (f)(1) and (2) of this section. An immediate startup, shutdown, and malfunction report is not required after January 11, 2021.

(13) Beginning on January 11, 2021 if you failed to meet an applicable standard, the compliance report must

include the start date, start time, and duration of each failure. For each failure, the compliance report must include a list of the affected sources or equipment, an estimate of the quantity of each regulated pollutant emitted over any emission limit, and a description of the method used to estimate the emissions.

(c) *Use of CEDRI template.* Beginning on January 11, 2021 or 180 days after the date the reporting template becomes available in CEDRI, whichever is later, submit all subsequent reports following the procedure specified in paragraph (d) of this section.

(d) *CEDRI submission.* If you are required to submit reports following the procedure specified in this paragraph, you must submit reports to the EPA via CEDRI, which can be accessed through EPA's CDX (*https://cdx.epa.gov/*). You must use the appropriate electronic report template on the CEDRI website (*https://www.epa.gov/electronic-reporting-air-emissions/compliance-and-emissions-data-reporting-interface-cedri*) for this subpart. The date report templates become available will be listed on the CEDRI website. The report must be submitted by the deadline specified in this subpart, regardless of the method in which the report is submitted. If you claim some of the information required to be submitted via CEDRI is CBI, submit a complete report, including information claimed to be CBI, to the EPA. The report must be generated using the appropriate form on the CEDRI website. Submit the file on a compact disc, flash drive, or other commonly used electronic storage medium and clearly mark the medium as CBI. Mail the electronic medium to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404–02, 4930 Old Page Rd., Durham, NC 27703. The same file with the CBI omitted must be submitted to the EPA via EPA's CDX as described earlier in this paragraph.

(e) *CDX outage.* If you are required to electronically submit a report through CEDRI in EPA's CDX, you may assert a claim of EPA system outage for failure to timely comply with the reporting requirement. To assert a claim of EPA system outage, you must meet the requirements outlined in paragraphs (e)(1) through (7) of this section.

(1) You must have been or will be precluded from accessing CEDRI and submitting a required report within the time prescribed due to an outage of either EPA's CEDRI or CDX systems.

(2) The outage must have occurred within the period of time beginning five business days prior to the date that the submission is due.

(3) The outage may be planned or unplanned.

(4) You must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or has caused a delay in reporting.

(5) You must provide to the Administrator a written description identifying:

(i) The date(s) and time(s) when CDX or CEDRI was accessed and the system was unavailable;

(ii) A rationale for attributing the delay in reporting beyond the regulatory deadline to EPA system outage;

(iii) Measures taken or to be taken to minimize the delay in reporting; and

(iv) The date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported.

(6) The decision to accept the claim of EPA system outage and allow an extension to the reporting deadline is solely within the discretion of the Administrator.

(7) In any circumstance, the report must be submitted electronically as soon as possible after the outage is resolved.

(f) *Claim of force majeure.* If you are required to electronically submit a report through CEDRI in EPA's CDX, you may assert a claim of force majeure for failure to timely comply with the reporting requirement. To assert a claim of force majeure, you must meet the requirements outlined in paragraphs (f)(1) through (5) of this section.

(1) You may submit a claim if a force majeure event is about to occur, occurs, or has occurred or there are lingering effects from such an event within the period of time beginning five business days prior to the date the submission is due. For the purposes of this section, a force majeure event is defined as an event that will be or has been caused by circumstances beyond the control of the affected facility, its contractors, or any entity controlled by the affected facility that prevents you from complying with the requirement to submit a report electronically within the time period prescribed. Examples of such events are acts of nature (*e.g.,* hurricanes, earthquakes, or floods), acts of war or terrorism, or equipment failure or safety hazard beyond the control of the affected facility (*e.g.,* large scale power outage).

(2) You must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or has caused a delay in reporting.

(3) You must provide to the Administrator:

(i) A written description of the force majeure event;

(ii) A rationale for attributing the delay in reporting beyond the regulatory deadline to the force majeure event;

(iii) Measures taken or to be taken to minimize the delay in reporting; and

(iv) The date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported.

(4) The decision to accept the claim of force majeure and allow an extension to the reporting deadline is solely within the discretion of the Administrator.

(5) In any circumstance, the reporting must occur as soon as possible after the force majeure event occurs.

(g) *Part 70 monitoring report.* If you have obtained a title V operating permit for an affected source pursuant to part 70 or 71 of this chapter, you must report all deviations as defined in this subpart in the semiannual monitoring report required by § 70.6(a)(3)(iii)(A) or § 71.6(a)(3)(iii)(A) of this chapter. If you submit a compliance report for an affected source along with, or as part of, the semiannual monitoring report required by § 70.6(a)(3)(iii)(A) or § 71.6(a)(3)(iii)(A) of this chapter, and the compliance report includes all the required information concerning deviations from any emission limitation, standard, or operation and maintenance requirement in this subpart, submission of the compliance report satisfies any obligation to report the same deviations in the semiannual monitoring report. However, submission of a compliance report does not otherwise affect any obligation you may have to report deviations from permit requirements for an affected source to your permitting authority.

■ 19. Section 63.7842 is amended by:

■ a. Revising paragraph (a)(2);

■ b. Redesignating paragraph (a)(3) as paragraph (a)(5);

■ c. Adding new paragraph (a)(3) and paragraph (a)(4);

■ d. Revising paragraph (b)(3); and

■ e. Adding paragraph (e).

The revisions and additions read as follows:

§ 63.7842 What records must I keep?

(a) * * *

(2) For existing sources and for new or reconstructed sources which commenced construction or reconstruction on or before August 16, 2019, before January 11, 2021, the records in § 63.6(e)(3)(iii) through (v) related to startup, shutdown, and malfunction for a period of five years. A

startup, shutdown, and malfunction plan is not required after January 11, 2021.

(3) For each failure to meet an applicable standard, a list of the affected sources or equipment, an estimate of the quantity of each regulated pollutant emitted over any emission limit, and a description of the method used to estimate the emissions.

(4) Records of the actions taken to minimize emissions in accordance with § 63.7810(d), and any corrective actions taken to return the affected unit to its normal or usual manner of operation.

* * * * *

(b) * * *

(3) Previous (that is, superseded) versions of the performance evaluation plan required under § 63.8(d)(2), with the program of corrective action included in the plan.

* * * * *

(e) If you are demonstrating compliance with the mercury emission limit in Table 1 through § 63.7791(c), you must keep records to demonstrate compliance with the requirements for mercury in § 63.7791(c) as applicable. If you are demonstrating compliance with the mercury emission limit in Table 1 through § 63.7791(d), you must keep records documenting compliance with § 63.7791(d) for scrap that does not contain mercury switches. If you are demonstrating compliance with the mercury emission limit in Table 1 through § 63.7791(e), you must maintain records identifying each scrap provider and documenting the scrap provider's participation in an approved mercury switch removal program. If you purchase scrap from a broker, you must maintain records identifying each broker and documentation that all scrap provided by the broker was obtained from other scrap providers who participate in an approved mercury switch removal program.

■ 20. Section 63.7851 is amended by revising paragraph (c) introductory text and adding paragraph (c)(5) to read as follows:

§ 63.7851 Who implements and enforces this subpart?

* * * * *

(c) The authorities that will not be delegated to State, local, or tribal agencies are specified in paragraphs (c)(1) through (5) of this section.

* * * * *

(5) Approval of an alternative to any electronic reporting to the EPA required by this subpart.

■ 21. Section 63.7852 is amended by:

■ a. Adding in alphabetical order a definition for ''basic oxygen process furnace group'';

■ b. Revising the definition of ''deviation''; and

■ c. Adding in alphabetical order definitions for ''mercury switch'', ''motor vehicle'', ''motor vehicle scrap'', ''opening'', ''post-consumer steel scrap'', ''pre-consumer steel scrap'', ''scrap provider'', ''shredded motor vehicle scrap'', ''specialty metal scrap'', and ''steel scrap''.

The additions and revision read as follows:

§ 63.7852 What definitions apply to this subpart?

* * * * *

Basic oxygen process furnace group means the collection of BOPF shop steelmaking operating units and their control devices including the BOPF primary emission control system, BOPF secondary control system, ladle metallurgy units, and hot metal transfer, desulfurization and slag skimming units that are operating at the time of each mercury test sequence. In the case of duplicate units in the BOPF Group, the BOPF Group for purposes of this rule means only those units operating at the time of the test sequence. See related definitions in this section for ''primary emissions,'' ''primary emission control system,'' ''secondary emissions,'' and ''secondary emission control system.''

* * * * *

Deviation means any instance in which an affected source subject to this subpart, or an owner or operator of such a source:

(1) Fails to meet any requirement or obligation established by this subpart, including but not limited to any emission limitation (including operating limits), standard, or operation and maintenance requirement;

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any affected source required to obtain such a permit; or

(3) Fails to meet any emission limitation in this subpart during startup, shutdown, or malfunction, regardless of whether or not such failure is permitted by this subpart.

* * * * *

Mercury switch means each mercury-containing capsule or switch assembly that is part of a convenience light switch mechanism installed in a motor vehicle.

Motor vehicle means an automotive vehicle not operated on rails and usually operated with rubber tires for use on roads and highways.

Motor vehicle scrap means post-consumer scrap from discarded automotive vehicles, in whole or in part, including automobile body hulks that have been processed through a shredder. Motor vehicle scrap does not include automobile manufacturing bundles or miscellaneous vehicle parts, such as wheels and bumpers, which do not contain mercury switches.

Opening means any roof monitor, vent, door, window, hole, crack or other conduit that allows gas to escape to the atmosphere from a blast furnace casthouse or BOPF shop.

Post-consumer steel scrap means steel scrap that is composed of materials made of steel that were purchased by households or by commercial, industrial, and institutional facilities in their role as end-users of the product and which can no longer be used for its intended purpose.

Pre-consumer steel scrap means steel scrap that is left over from industrial or manufacturing processes and which is subsequently recycled as scrap. Other terms used to describe this scrap are new, home, run-around, prompt-industrial, and return scrap.

* * * * *

Scrap provider means the company or person (including a broker) who contracts directly with an integrated iron and steel manufacturing facility to provide steel scrap. Scrap processors, such as shredder operators or vehicle dismantlers, who do not sell scrap directly to an integrated iron and steel manufacturing facility are not scrap providers.

* * * * *

Shredded motor vehicle scrap means post-consumer scrap from discarded automotive vehicles that has been processed through a shredder.

* * * * *

Specialty metal scrap means scrap where the only materials from motor vehicles in the scrap are materials (such as certain exhaust systems) recovered for their specialty alloy content (including, but not limited to, chromium, nickel, molybdenum, or other alloys), and, based on the nature of the scrap and purchase specifications, the scrap is not expected to contain mercury switches.

* * * * *

Steel scrap means pre-consumer and post-consumer discarded steel that is processed by scrap providers for resale (post-consumer) or used on-site (pre-consumer or run-around scrap from within a facility or company). Post-consumer steel scrap may or may not

contain motor vehicle scrap, depending on the type of scrap.

* * * * *

■ 22. Table 1 to Subpart FFFFF of Part 63 is revised to read as follows:

As required in § 63.7790(a), you must comply with each applicable emission and opacity limit in the following table:

TABLE 1 TO SUBPART FFFFF OF PART 63—EMISSION AND OPACITY LIMITS

For . . .	You must comply with each of the following . . .
1. Each windbox exhaust stream at an existing sinter plant.	You must not cause to be discharged to the atmosphere any gases that contain particulate matter in excess of 0.4 lb/ton of product sinter.
2. Each windbox exhaust stream at a new sinter plant.	You must not cause to be discharged to the atmosphere any gases that contain particulate matter in excess of 0.3 lb/ton of product sinter.
3. Each discharge end at an existing sinter plant.	a. You must not cause to be discharged to the atmosphere any gases that exit from one or more control devices that contain, on a flow-weighted basis, particulate matter in excess of 0.02 gr/dscf [1] [2]; and b. You must not cause to be discharged to the atmosphere any secondary emissions that exit any opening in the building or structure housing the discharge end that exhibit opacity greater than 20 percent (6-minute average).
4. Each discharge end at a new sinter plant.	a. You must not cause to be discharged to the atmosphere any gases that exit from one or more control devices that contain, on a flow weighted basis, particulate matter in excess of 0.01 gr/dscf; and b. You must not cause to be discharged to the atmosphere any secondary emissions that exit any opening in the building or structure housing the discharge end that exhibit opacity greater than 10 percent (6-minute average).
5. Each sinter cooler at an existing sinter plant.	You must not cause to be discharged to the atmosphere any emissions that exhibit opacity greater than 10 percent (6-minute average).
6. Each sinter cooler at a new sinter plant.	You must not cause to be discharged to the atmosphere any gases that contain particulate matter in excess of 0.01 gr/dscf.
7. Each casthouse at an existing blast furnace.	a. You must not cause to be discharged to the atmosphere any gases that exit from a control device that contain particulate matter in excess of 0.01 gr/dscf [2]; and b. You must not cause to be discharged to the atmosphere any secondary emissions that exit all openings in the casthouse or structure housing the blast furnace that exhibit opacity greater than 20 percent (6-minute average).
8. Each casthouse at a new blast furnace.	a. You must not cause to be discharged to the atmosphere any gases that exit from a control device that contain particulate matter in excess of 0.003 gr/dscf; and b. You must not cause to be discharged to the atmosphere any secondary emissions that exit all openings in the casthouse or structure housing the blast furnace that exhibit opacity greater than 15 percent (6-minute average).
9. Each BOPF at a new or existing shop.	a. You must not cause to be discharged to the atmosphere any gases that exit from a primary emission control system for a BOPF with a closed hood system at a new or existing BOPF shop that contain, on a flow-weighted basis, particulate matter in excess of 0.03 gr/dscf during the primary oxygen blow [2] [3]; and b. You must not cause to be discharged to the atmosphere any gases that exit from a primary emission control system for a BOPF with an open hood system that contain, on a flow-weighted basis, particulate matter in excess of 0.02 gr/dscf during the steel production cycle for an existing BOPF shop [2] [3] or 0.01 gr/dscf during the steel production cycle for a new BOPF shop [3]; and c. You must not cause to be discharged to the atmosphere any gases that exit from a control device used solely for the collection of secondary emissions from the BOPF that contain particulate matter in excess of 0.01 gr/dscf for an existing BOPF shop [2] or 0.0052 gr/dscf for a new BOPF shop.
10. Each hot metal transfer, skimming, and desulfurization operation at a new or existing BOPF shop.	You must not cause to be discharged to the atmosphere any gases that exit from a control device that contain particulate matter in excess of 0.01 gr/dscf for an existing BOPF shop [2] or 0.003 gr/dscf for a new BOPF shop.
11. Each ladle metallurgy operation at a new or existing BOPF shop.	You must not cause to be discharged to the atmosphere any gases that exit from a control device that contain particulate matter in excess of 0.01 gr/dscf for an existing BOPF shop [2] or 0.004 gr/dscf for a new BOPF shop.
12. Each existing BOPF shop.	You must not cause to be discharged to the atmosphere any secondary emissions that exit any opening in the BOPF shop or any other building housing the BOPF or BOPF shop operation that exhibit opacity greater than 20 percent (3-minute average).
13. Each new BOPF shop ...	a. You must not cause to be discharged to the atmosphere any secondary emissions that exit any opening in the BOPF shop or other building housing a bottom-blown BOPF or BOPF shop operations that exhibit opacity (for any set of 6-minute averages) greater than 10 percent, except that one 6-minute period not to exceed 20 percent may occur once per steel production cycle; or b. You must not cause to be discharged to the atmosphere any secondary emissions that exit any opening in the BOPF shop or other building housing a top-blown BOPF or BOPF shop operations that exhibit opacity (for any set of 3-minute averages) greater than 10 percent, except that one 3-minute period greater than 10 percent but less than 20 percent may occur once per steel production cycle.
14. Each BOPF Group at an existing BOPF shop.	You must not cause to be discharged to the atmosphere any gases that exit from the collection of BOPF Group control devices that contain mercury in excess of 0.00026 lb/ton of steel scrap input to the BOPF.
15. Each BOPF Group at a new BOPF shop.	You must not cause to be discharged to the atmosphere any gases that exit from the collection of BOPF Group control devices that contain mercury in excess of 0.000081 lb/ton of steel scrap input to the BOPF.

[1] This limit applies if the cooler is vented to the same control device as the discharge end.

[2] This concentration limit (gr/dscf) for a control device does not apply to discharges inside a building or structure housing the discharge end at an existing sinter plant, inside a casthouse at an existing blast furnace, or inside an existing BOPF shop if the control device was installed before August 30, 2005.

[3] This limit applies to control devices operated in parallel for a single BOPF during the oxygen blow.

■ 23. Table 2 to Subpart FFFFF of Part 63 is revised to read as follows:

As required in § 63.7826(a)(1), you must demonstrate initial compliance with the emission and opacity limits according to the following table:

TABLE 2 TO SUBPART FFFFF OF PART 63—INITIAL COMPLIANCE WITH EMISSION AND OPACITY LIMITS

For . . .	You have demonstrated initial compliance if . . .
1. Each windbox exhaust stream at an existing sinter plant.	The process-weighted mass rate of particulate matter from a windbox exhaust stream, measured according to the performance test procedures in § 63.7822(c), did not exceed 0.4 lb/ton of product sinter.
2. Each windbox exhaust stream at a new sinter plant.	The process-weighted mass rate of particulate matter from a windbox exhaust stream, measured according to the performance test procedures in § 63.7822(c), did not exceed 0.3 lb/ton of product sinter.
3. Each discharge end at an existing sinter plant.	a. The flow-weighted average concentration of particulate matter from one or more control devices applied to emissions from a discharge end, measured according to the performance test procedures in § 63.7822(d), did not exceed 0.02 gr/dscf; and b. The opacity of secondary emissions from each discharge end, determined according to the performance test procedures in § 63.7823(c), did not exceed 20 percent (6-minute average).
4. Each discharge end at a new sinter plant.	a. The flow-weighted average concentration of particulate matter from one or more control devices applied to emissions from a discharge end, measured according to the performance test procedures in § 63.7822(d), did not exceed 0.01 gr/dscf; and b. The opacity of secondary emissions from each discharge end, determined according to the performance test procedures in § 63.7823(c), did not exceed 10 percent (6-minute average).
5. Each sinter cooler at an existing sinter plant.	The opacity of emissions, determined according to the performance test procedures in § 63.7823(e), did not exceed 10 percent (6-minute average).
6. Each sinter cooler at a new sinter plant.	The average concentration of particulate matter, measured according to the performance test procedures in § 63.7822(b), did not exceed 0.01 gr/dscf.
7. Each casthouse at an existing blast furnace.	a. The average concentration of particulate matter from a control device applied to emissions from a casthouse, measured according to the performance test procedures in § 63.7822(e), did not exceed 0.01 gr/dscf; and b. The opacity of secondary emissions from each casthouse, determined according to the performance test procedures in § 63.7823(c), did not exceed 20 percent (6-minute average).
8. Each casthouse at a new blast furnace.	a. The average concentration of particulate matter from a control device applied to emissions from a casthouse, measured according to the performance test procedures in § 63.7822(e), did not exceed 0.003 gr/dscf; and b. The opacity of secondary emissions from each casthouse, determined according to the performance test procedures in § 63.7823(c), did not exceed 15 percent (6-minute average).
9. Each BOPF at a new or existing BOPF shop.	a. The average concentration of particulate matter from a primary emission control system applied to emissions from a BOPF with a closed hood system, measured according to the performance test procedures in § 63.7822(f), did not exceed 0.03 gr/dscf for a new or existing BOPF shop; b. The average concentration of particulate matter from a primary emission control system applied to emissions from a BOPF with an open hood system, measured according to the performance test procedures in § 63.7822(g), did not exceed 0.02 gr/dscf for an existing BOPF shop or 0.01 gr/dscf for a new BOPF shop; and c. The average concentration of particulate matter from a control device applied solely to secondary emissions from a BOPF, measured according to the performance test procedures in § 63.7822(g), did not exceed 0.01 gr/dscf for an existing BOPF shop or 0.0052 gr/dscf for a new BOPF shop.
10. Each hot metal transfer skimming, and desulfurization at a new or existing BOPF shop.	The average concentration of particulate matter from a control device applied to emissions from hot metal transfer, skimming, or desulfurization, measured according to the performance test procedures in § 63.7822(h), did not exceed 0.01 gr/dscf for an existing BOPF shop or 0.003 gr/dscf for a new BOPF shop.
11. Each ladle metallurgy operation at a new or existing BOPF shop.	The average concentration of particulate matter from a control device applied to emissions from a ladle metallurgy operation, measured according to the performance test procedures in § 63.7822(h), did not exceed 0.01 gr/dscf for an existing BOPF shop or 0.004 gr/dscf for a new BOPF shop.
12. Each existing BOPF shop.	The opacity of secondary emissions from each BOPF shop, determined according to the performance test procedures in § 63.7823(d), did not exceed 20 percent (3-minute average).
13. Each new BOPF shop ...	a. The opacity of the highest set of 6-minute averages from each BOPF shop housing a bottom-blown BOPF, determined according to the performance test procedures in § 63.7823(d), did not exceed 20 percent and the second highest set of 6-minute averages did not exceed 10 percent; or b. The opacity of the highest set of 3-minute averages from each BOPF shop housing a top-blown BOPF, determined according to the performance test procedures in § 63.7823(d), did not exceed 20 percent and the second highest set of 3-minute averages did not exceed 10 percent.
14. Each BOPF Group at an existing BOPF shop.	If demonstrating compliance through performance testing, the average emissions of mercury from the collection of BOPF Group control devices applied to the emissions from the BOPF Group, measured according to the performance test procedures in § 63.7825, did not exceed 0.00026 lb/ton steel scrap input to the BOPF.
15. Each BOPF Group at a new BOPF shop.	If demonstrating compliance through performance testing, the average emissions of mercury from the collection of BOPF Group control devices applied to the emissions from the BOPF Group, measured according to the performance test procedures in § 63.7825, did not exceed 0.000081 lb/ton steel scrap input to the BOPF.

■ 24. Table 3 to Subpart FFFFF of Part 63 is revised to read as follows:

As required in § 63.7833(a), you must demonstrate continuous compliance with the emission and opacity limits according to the following table:

TABLE 3 TO SUBPART FFFFF OF PART 63—CONTINUOUS COMPLIANCE WITH EMISSION AND OPACITY LIMITS

For . . .	You must demonstrate continuous compliance by . . .
1. Each windbox exhaust stream at an existing sinter plant.	a. Maintaining emissions of particulate matter at or below 0.4 lb/ton of product sinter; and
	b. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
2. Each windbox exhaust stream at a new sinter plant.	a. Maintaining emissions of particulate matter at or below 0.3 lb/ton of product sinter; and
	b. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
3. Each discharge end at an existing sinter plant.	a. Maintaining emissions of particulate matter from one or more control devices at or below 0.02 gr/dscf; and
	b. Maintaining the opacity of secondary emissions that exit any opening in the building or structure housing the discharge end at or below 20 percent (6-minute average); and
	c. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
4. Each discharge end at a new sinter plant.	a. Maintaining emissions of particulate matter from one or more control devices at or below 0.01 gr/dscf; and
	b. Maintaining the opacity of secondary emissions that exit any opening in the building or structure housing the discharge end at or below 10 percent (6-minute average); and
	c. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
5. Each sinter cooler at an existing sinter plant.	a. Maintaining the opacity of emissions that exit any sinter cooler at or below 10 percent (6-minute average); and
	b. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
6. Each sinter cooler at a new sinter plant.	a. Maintaining emissions of particulate matter at or below 0.1 gr/dscf; and
	b. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
7. Each casthouse at an existing blast furnace.	a. Maintaining emissions of particulate matter from a control device at or below 0.01 gr/dscf; and
	b. Maintaining the opacity of secondary emissions that exit all openings in the casthouse or structure housing the casthouse at or below 20 percent (6-minute average); and
	c. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
8. Each casthouse at a new blast furnace.	a. Maintaining emissions of particulate matter from a control device at or below 0.003 gr/dscf; and
	b. Maintaining the opacity of secondary emissions that exit all openings in the casthouse or structure housing the casthouse at or below 15 percent (6-minute average); and
	c. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
9. Each BOPF at a new or existing BOPF shop.	a. Maintaining emissions of particulate matter from the primary control system for a BOPF with a closed hood system at or below 0.03 gr/dscf; and
	b. Maintaining emissions of particulate matter from the primary control system for a BOPF with an open hood system at or below 0.02 gr/dscf for an existing BOPF shop or 0.01 gr/dscf for a new BOPF shop; and
	c. Maintaining emissions of particulate matter from a control device applied solely to secondary emissions from a BOPF at or below 0.01 gr/dscf for an existing BOPF shop or 0.0052 gr/dscf for a new BOPF shop; and
	d. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
10. Each hot metal transfer, skimming, and desulfurization operation at a new or existing BOPF shop.	a. Maintaining emissions of particulate matter from a control device at or below 0.01 gr/dscf at an existing BOPF or 0.003 gr/dscf for a new BOPF; and
	b. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
11. Each ladle metallurgy operation at a new or existing BOPF shop.	a. Maintaining emissions of particulate matter from a control device at or below 0.01 gr/dscf at an existing BOPF shop or 0.004 gr/dscf for a new BOPF shop; and
	b. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
12. Each existing BOPF shop.	a. Maintaining the opacity of secondary emissions that exit any opening in the BOPF shop or other building housing the BOPF shop or shop operation at or below 20 percent (3-minute average); and
	b. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
13. Each new BOPF shop ...	a. Maintaining the opacity (for any set of 6-minute averages) of secondary emissions that exit any opening in the BOPF shop or other building housing a bottom-blown BOPF or shop operation at or below 10 percent, except that one 6-minute period greater than 10 percent but no more than 20 percent may occur once per steel production cycle; and
	b. Maintaining the opacity (for any set of 3-minute averages) of secondary emissions that exit any opening in the BOPF shop or other building housing a top-blown BOPF or shop operation at or below 10 percent, except that one 3-minute period greater than 10 percent but less than 20 percent may occur once per steel production cycle; and
	c. Conducting subsequent performance tests at the frequencies specified in § 63.7821.
14. Each BOPF Group at an existing BOPF shop.	a. Maintaining emissions of mercury from the collection of BOPF Group control devices at or below 0.00026 lb/ton steel scrap input to the BOPF; and
	b. If demonstrating compliance through performance testing, conducting subsequent performance tests at the frequencies specified in § 63.7821; and
	c. If demonstrating compliance through § 63.7791(c), (d), or (e), maintaining records pursuant to § 63.7842(e).
15. Each BOPF Group at a new BOPF shop.	a. Maintaining emissions of mercury from the collection of BOPF Group control devices at or below 0.000081 lb/ton steel scrap input to the BOPF; and
	b. If demonstrating compliance through performance testing, conducting subsequent performance tests at the frequencies specified in § 63.7821; and

TABLE 3 TO SUBPART FFFFF OF PART 63—CONTINUOUS COMPLIANCE WITH EMISSION AND OPACITY LIMITS—Continued

For . . .	You must demonstrate continuous compliance by . . .
	c. If demonstrating compliance through § 63.7791(c), (d), or (e), maintaining records pursuant to § 63.7842(e).

■ 25. Table 4 to Subpart FFFFF of Part 63 is revised to read as follows:

As required in § 63.7850, you must comply with the requirements of the NESHAP General Provisions (40 CFR part 63, subpart A) shown in the following table:

TABLE 4 TO SUBPART FFFFF OF PART 63—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART FFFFF

Citation	Subject	Applies to Subpart FFFFF	Explanation
§ 63.1	Applicability	Yes	
§ 63.2	Definitions	Yes	
§ 63.3	Units and Abbreviations	Yes	
§ 63.4	Prohibited Activities	Yes	
§ 63.5	Construction/Reconstruction	Yes	
§ 63.6(a), (b), (c), (d), (e)(1)(iii), (f)(2)–(3), (g), (h)(2)(ii)–(h)(9).	Compliance with Standards and Maintenance Requirements.	Yes	
§ 63.6(e)(1)(i)	General Duty to Minimize Emissions.	No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes on or before January 11, 2021 and No thereafter.	See § 63.7810(d) for general duty requirement.
§ 63.6(e)(1)(ii)	Requirement to Correct Malfunctions ASAP.	No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes, on or before January 11, 2021 and No thereafter.	
§ 63.6(e)(3)	SSM Plan Requirements	No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes on or before January 11, 2021 and No thereafter.	See § 63.7810(c)
§ 63.6(f)(1)	Compliance except during SSM	No	See § 63.7810(a).
§ 63.6(h)(1)	Compliance except during SSM	No	See § 63.7810(a).
§ 63.6(h)(2)(i)	Determining Compliance with Opacity and VE Standards.	No	Subpart FFFFF specifies methods and procedures for determining compliance with opacity emission and operating limits.
§ 63.6(i)	Extension of Compliance with Emission Standards.	Yes	
§ 63.6(j)	Exemption from Compliance with Emission Standards.	Yes	
§ 63.7(a)(1)–(2)	Applicability and Performance Test Dates.	No	Subpart FFFFF and specifies performance test applicability and dates.
§ 63.7(a)(3), (b)–(d), (e)(2)–(4), (f)–(h).	Performance Testing Requirements.	Yes	
§ 63.7(e)(1)	Performance Testing	No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes on or before January 11, 2021 and No thereafter.	See §§ 63.7822(a), 63.7823(a), and 63.7825(a).
§ 63.8(a)(1)–(3), (b), (c)(1)(ii), (c)(2)–(3), (c)(4)(i)–(ii), (c)(5)–(6), (c)(7)–(8), (d)(1)–(2), (e), (f)(1)–(5), (g)(1)–(4).	Monitoring Requirements	Yes	CMS requirements in § 63.8(c)(4)(i)–(ii), (c)(5)–(6), (d)(1)–(2), and (e) apply only to COMS.
§ 63.8(a)(4)	Additional Monitoring Requirements for Control Devices in § 63.11.	No	Subpart FFFFF does not require flares.

TABLE 4 TO SUBPART FFFFF OF PART 63—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART FFFFF—Continued

Citation	Subject	Applies to Subpart FFFFF	Explanation
§ 63.8(c)(1)(i)	General Duty to Minimize Emissions and CMS Operation.	No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes on or before January 11, 2021 and No thereafter.	
§ 63.8(c)(1)(iii)	Requirement to Develop SSM Plan for CMS.	No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes on or before January 11, 2021 and No thereafter.	
§ 63.8(c)(4)	Continuous Monitoring System Requirements.	No	Subpart FFFFF specifies requirements for operation of CMS.
§ 63.8(d)(3)	Written procedures for CMS	No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes on or before January 11, 2021 and No thereafter.	See § 63.7842(b)(3).
§ 63.8(f)(6)	RATA Alternative	No	
§ 63.8(g)(5)	Data Reduction	No	Subpart FFFFF specifies data reduction requirements.
§ 63.9	Notification Requirements	Yes	Additional notifications for CMS in § 63.9(g) apply only to COMS.
§ 63.10(a), (b)(1), (b)(2)(x), (b)(2)(xiv), (b)(3), (c)(1)–(6), (c)(9)–(14), (d)(1)–(4), (e)(1)–(2), (e)(4), (f).	Recordkeeping and Reporting Requirements.	Yes	Additional records for CMS in § 63.10(c)(1)–(6), (9)–(14), and reports in § 63.10(d)(1)–(2) apply only to COMS.
§ 63.10(b)(2)(i)	Recordkeeping of Occurrence and Duration of Startups and Shutdowns.	No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes on or before January 11, 2021 and No thereafter.	
§ 63.10(b)(2)(ii)	Recordkeeping of Failures to Meet a Standard.	No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes on or before January 11, 2021 and No thereafter.	See § 63.7842(a)(2)–(4) for recordkeeping of (1) date, time, and duration of failure to meet the standard; (2) listing of affected source or equipment, and an estimate of the quantity of each regulated pollutant emitted over the standard; and (3) actions to minimize emissions and correct the failure.
§ 63.10(b)(2)(iii)	Maintenance Records	Yes	
§ 63.10(b)(2)(iv)	Actions Taken to Minimize Emissions During SSM.	No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes on or before January 11, 2021 and No thereafter.	See § 63.7842(a)(4) for records of actions taken to minimize emissions.
§ 63.10(b)(2)(v)	Actions Taken to Minimize Emissions During SSM.	No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes on or before January 11, 2021 and No thereafter.	See § 63.7842(a)(4) for records of actions taken to minimize emissions.
§ 63.10(b)(2)(vi)	Recordkeeping for CMS Malfunctions.	Yes	
§ 63.10(b)(2)(vii)–(ix)	Other CMS Requirements	Yes	
§ 63.10(b)(2)(xiii)	CMS Records for RATA Alternative.	No	

TABLE 4 TO SUBPART FFFFF OF PART 63—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART FFFFF—Continued

Citation	Subject	Applies to Subpart FFFFF	Explanation
§ 63.10(c)(7)–(8)	Records of Excess Emissions and Parameter Monitoring Exceedances for CMS.	No	Subpart FFFFF specifies record requirements; see § 63.7842.
§ 63.10(c)(15)	Use of SSM Plan	No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes on or before January 11, 2021 and No thereafter.	
§ 63.10(d)(5)(i)	Periodic SSM Reports	No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes on or before January 11, 2021 and No thereafter.	See § 63.7841(b)(4) for malfunction reporting requirements.
§ 63.10(d)(5)(ii)	Immediate SSM Reports	No, for new or reconstructed sources which commenced construction or reconstruction after August 16, 2019. For all other affected sources, Yes on or before January 11, 2021 and No thereafter.	
§ 63.10(e)(3)	Excess Emission Reports	No	Subpart FFFFF specifies reporting requirements; see § 63.7841.
§ 63.11	Control Device Requirements	No	Subpart FFFFF does not require flares.
§ 63.12	State Authority and Delegations	Yes	
§ 63.13–§ 63.16	Addresses, Incorporations by Reference, Availability of Information and Confidentiality, Performance Track Provisions.	Yes

National Emission Standards for Hazardous Air Pollutants: Iron and Steel Foundries Major Source Residual Risk and Technology Review and Area Source Technology Review

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action finalizes the residual risk and technology review (RTR) conducted for the major source Iron and Steel Foundries source category and the technology review for the area source Iron and Steel Foundries source category regulated under national emission standards for hazardous air pollutants (NESHAP). In addition, we are taking final action to remove exemptions for periods of startup, shutdown, and malfunction (SSM) and to specify that emissions standards apply at all times. These final amendments also require electronic reporting of performance test results and compliance reports and make minor corrections and clarifications to a few other rule provisions for major sources and area sources.

DATES: This final rule is effective on September 10, 2020. The incorporation by reference of certain publications listed in the rule is approved by the Director of the Federal Register as of January 2, 2008.

ADDRESSES: The U.S. Environmental Protection Agency (EPA) has established a docket for this action under Docket ID No. EPA–HQ–OAR–2019–0373. All documents in the docket are listed on the *https://www.regulations.gov/* website. Although listed, some information is not publicly available, *e.g.,* Confidential Business Information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the internet and will be publicly available only in hard copy form. Publicly available docket materials are available electronically through *https://www.regulations.gov/.* Out of an abundance of caution for members of the public and our staff, the EPA Docket Center and Reading Room was closed to public visitors on March 31, 2020, to reduce the risk of transmitting COVID–19. Our Docket Center staff will continue to provide remote customer service via email, phone, and webform. There is a temporary suspension of mail delivery to the EPA, and no hand deliveries are currently accepted. For further information and updates on EPA Docket Center services and the current status, please visit us online at *https://www.epa.gov/dockets.*

FOR FURTHER INFORMATION CONTACT: For questions about this final action, contact Phil Mulrine, Sector Policies and Programs Division (D243–02), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–5289; fax number: (919) 541–4991; and email address: *mulrine.phil@epa.gov.* For specific information regarding the risk modeling methodology, contact Ted Palma, Health and Environmental Impacts Division (C539–02), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–5470; fax number: (919) 541–0840; and email address: *palma.ted@epa.gov.* For information about the applicability of the NESHAP to a particular entity, contact Maria Malave, Office of Enforcement and Compliance Assurance, U.S. Environmental Protection Agency, WJC South Building (Mail Code 2227A), 1200 Pennsylvania Ave. NW, Washington, DC 20460; telephone number: (202) 564–7027; and email address: *malave.maria@epa.gov.*

SUPPLEMENTARY INFORMATION:

Preamble acronyms and abbreviations. We use multiple acronyms and terms in this preamble. While this list may not be exhaustive, to ease the reading of this preamble and for reference purposes, the EPA defines the following terms and acronyms here:

ATSDR Agency for Toxic Substances and Disease Registry
CAA Clean Air Act
CalEPA California EPA
CDX Central Data Exchange
CEDRI Compliance and Emissions Data Reporting Interface
CFR Code of Federal Regulations
CRA Congressional Review Act
e.g. exempli gratia (for example)
EPA Environmental Protection Agency
FQPA Food Quality Protection Act
GACT generally available control technology
HAP hazardous air pollutant(s)
HQ hazard quotient
i.e. id est (that is)
IRIS Integrated Risk Information System
km kilometer
MACT maximum achievable control technology
MIR maximum individual risk
MOA mode of action
NAICS North American Industry Classification System
NESHAP national emission standards for hazardous air pollutants

VOHAP volatile organic hazardous air pollutant(s)

Background information. On October 9, 2019 (84 FR 54394), the EPA proposed decisions related to the major source Iron and Steel Foundries NESHAP based on our RTR and the area source Iron and Steel Foundries NESHAP based on our technology review. In this action, we are finalizing those decisions and other revisions to the rules. We summarize some of the more significant comments we timely received regarding the proposed rules and provide our responses in this preamble. A summary of all other public comments on the proposal and the EPA's responses to those comments is available in the *National Emission Standards for Hazardous Air Pollutants: Iron and Steel Foundries Major Source Residual Risk and Technology Review and Area Source Technology Review—Final Rule—Summary of Public Comments and Responses,* which is available in the docket (Docket ID No. EPA–HQ–OAR–2019–0373). A ''track changes'' version of the regulatory language that incorporates the changes in this action is available in the docket.

Organization of this document. The information in this preamble is organized as follows:

I. General Information
A. Does this action apply to me?
B. Where can I get a copy of this document and other related information?
C. Judicial Review and Administrative Reconsideration
II. Background
A. What is the statutory authority for this action?
B. What are the Iron and Steel Foundries source categories and how do the NESHAP regulate HAP emissions from the source categories?
C. What changes did we propose for the Iron and Steel Foundries source categories in our October 9, 2019, proposal?

III. What is included in these final rules?
A. What are the final rule amendments based on the risk review for the major source Iron and Steel Foundries source category?
B. What are the final rule amendments based on the technology review for the Iron and Steel Foundries source categories?
C. What are the final rule amendments addressing emissions during periods of SSM?
D. What other changes have been made to the NESHAP?
E. What are the effective and compliance dates of the standards?
IV. What is the rationale for our final decisions and amendments for the Iron and Steel Foundries source categories?
A. Residual Risk Review for the Major Source Iron and Steel Foundries Source Category
B. Technology Review for the Iron and Steel Foundries Source Categories
C. Removal of the SSM Exemptions
D. Electronic Reporting
E. Technical and Editorial Corrections
V. Summary of Cost, Environmental, and Economic Impacts and Additional Analyses Conducted
A. What are the affected sources?
B. What are the air quality impacts?
C. What are the cost impacts?
D. What are the economic impacts?
E. What are the benefits?
F. What analysis of environmental justice did we conduct?
G. What analysis of children's environmental health did we conduct?
VI. Statutory and Executive Order Reviews
A. Executive Orders 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review
B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs
C. Paperwork Reduction Act (PRA)
D. Regulatory Flexibility Act (RFA)
E. Unfunded Mandates Reform Act (UMRA)
F. Executive Order 13132: Federalism
G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks
I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
J. National Technology Transfer and Advancement Act (NTTAA)
K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations
L. Congressional Review Act (CRA)

I. General Information

A. Does this action apply to me?

Regulated entities. Categories and entities potentially regulated by this action are shown in Table 1 of this preamble.

TABLE 1—NESHAP AND INDUSTRIAL SOURCE CATEGORIES AFFECTED BY THIS FINAL ACTION

Source category	NESHAP	NAICS [1] code
Iron and Steel Foundries	40 CFR part 63, subpart EEEEE	331511
	40 CFR part 63, subpart ZZZZZ	331512
		331513

[1] North American Industry Classification System.

Table 1 of this preamble is not intended to be exhaustive, but rather to provide a guide for readers regarding entities likely to be affected by the final action for the source category listed. To determine whether your facility is affected, you should examine the applicability criteria in the appropriate NESHAP. If you have any questions regarding the applicability of any aspect of this NESHAP, please contact the appropriate person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section of this preamble.

B. Where can I get a copy of this document and other related information?

In addition to being available in the docket, an electronic copy of this final action will also be available on the internet. Following signature by the EPA Administrator, the EPA will post a copy of this final action at: *https://www.epa.gov/stationary-sources-air-pollution/iron-and-steel-foundries-national-emissions-standards-hazardous-air* and *https://www.epa.gov/stationary-sources-air-pollution/iron-and-steel-foundries-national-emission-standards-hazardous-air.* Following publication in the **Federal Register**, the EPA will post the **Federal Register** version and key technical documents at this same website.

Additional information is available on the RTR website at *https://www.epa.gov/stationary-sources-air-pollution/risk-and-technology-review-national-emissions-standards-hazardous.* This information includes an overview of the RTR program and links to project websites for the RTR source categories.

C. Judicial Review and Administrative Reconsideration

Under Clean Air Act (CAA) section 307(b)(1), judicial review of this final action is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit (the Court) by November 9, 2020. Under CAA section 307(b)(2), the requirements established by this final rule may not be challenged separately in any civil or criminal proceedings brought by the EPA to enforce the requirements.

Section 307(d)(7)(B) of the CAA further provides that only an objection to a rule or procedure which was raised with reasonable specificity during the period for public comment (including any public hearing) may be raised during judicial review. This section also provides a mechanism for the EPA to reconsider the rule if the person raising an objection can demonstrate to the Administrator that it was impracticable to raise such objection within the period for public comment or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule. Any person seeking to make such a demonstration should submit a Petition for Reconsideration to the Office of the Administrator, U.S. EPA, Room 3000, WJC South Building, 1200 Pennsylvania Ave. NW, Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. EPA, 1200 Pennsylvania Ave. NW, Washington, DC 20460.

II. Background

A. What is the statutory authority for this action?

Section 112 of the CAA establishes a two-stage regulatory process to address emissions of hazardous air pollutants (HAP) from stationary sources. In the first stage, we must identify categories of sources emitting one or more of the HAP listed in CAA section 112(b) and then promulgate technology-based NESHAP for those sources. ''Major

sources'' are those that emit, or have the potential to emit, any single HAP at a rate of 10 tons per year (tpy) or more, or 25 tpy or more of any combination of HAP. All other sources are ''area sources.'' For major sources, these standards are commonly referred to as maximum achievable control technology (MACT) standards and must reflect the maximum degree of emission reductions of HAP achievable (after considering cost, energy requirements, and non-air quality health and environmental impacts). In developing MACT standards, CAA section 112(d)(2) directs the EPA to consider the application of measures, processes, methods, systems, or techniques, including, but not limited to, those that reduce the volume of or eliminate HAP emissions through process changes, substitution of materials, or other modifications; enclose systems or processes to eliminate emissions; collect, capture, or treat HAP when released from a process, stack, storage, or fugitive emissions point; are design, equipment, work practice, or operational standards; or any combination of the above.

For these MACT standards, the statute specifies certain minimum stringency requirements, which are referred to as MACT floor requirements, and which may not be based on cost considerations. See CAA section 112(d)(3). For new sources, the MACT floor cannot be less stringent than the emission control achieved in practice by the best-controlled similar source. The MACT standards for existing sources can be less stringent than floors for new sources, but they cannot be less stringent than the average emission limitation achieved by the best-performing 12 percent of existing sources in the category or subcategory (or the best-performing five sources for categories or subcategories with fewer than 30 sources). In developing MACT standards, we must also consider control options that are more stringent than the floor under CAA section 112(d)(2). We may establish standards more stringent than the floor, based on the consideration of the cost of achieving the emissions reductions, any non-air quality health and environmental impacts, and energy requirements. For area sources, CAA section 112(d)(5) gives the EPA discretion to set standards based on generally available control technologies or management practices (GACT standards) in lieu of MACT standards.

In the second stage of the NESHAP regulatory process, the CAA requires the EPA to undertake two different analyses, which we refer to as the technology review and the residual risk review. Under the technology review, which is applicable to both MACT and GACT standards, we must review the technology-based standards and revise them ''as necessary (taking into account developments in practices, processes, and control technologies)'' no less frequently than every 8 years, pursuant to CAA section 112(d)(6). Under the residual risk review, which is limited to the MACT standards, we must evaluate the risk to public health remaining after application of the technology-based standards and revise the standards, if necessary, to provide an ample margin of safety to protect public health or to prevent, taking into consideration costs, energy, safety, and other relevant factors, an adverse environmental effect. The residual risk review is required within 8 years after promulgation of the technology-based MACT standards, pursuant to CAA section 112(f). In conducting the residual risk review, if the EPA determines that the current standards provide an ample margin of safety to protect public health, it is not necessary to revise the MACT standards pursuant to CAA section 112(f).[1] For more information on the statutory authority for this rule, see 84 FR 54394.

B. What are the Iron and Steel Foundries source categories and how do the NESHAP regulate HAP emissions from these source categories?

The EPA promulgated the MACT standards for major source iron and steel foundries on April 22, 2004 (69 FR 21906). The standards are codified at 40 CFR part 63, subpart EEEEE. The EPA promulgated GACT standards for area source iron and steel foundries on January 2, 2008, under 40 CFR part 63, subpart ZZZZZ (73 FR 252). Iron and steel foundries manufacture metal castings by melting iron and/or steel in a furnace, pouring the molten iron or steel into a mold of a desired shape, allowing the casting to cool (solidify) in the mold, removing the casting from the mold, and finishing (grinding and cleaning) the final cast product. There are approximately 45 major source iron and steel foundries in the United States and approximately 390 area source foundries.

The MACT standards for major source iron and steel foundries established the following: Particulate matter (PM) emission limits (as a surrogate for metal HAP) and alternative metal HAP emission limits for metal melting furnaces; triethylamine emission limits from phenolic urethane cold box mold and core making operations; and organic HAP emission limits for new and existing cupola melting furnaces and scrap preheaters and for new automated cooling and shakeout lines. The MACT standards also included work practice standards prohibiting methanol to be used as a specific component of furan (also known as furfuryl alcohol) warm box mold and core making lines and instituting scrap selection and inspection requirements to limit the amount of mercury, lead, chlorinated plastics, and free liquids present in the scrap fed to metal melting furnaces. For other ancillary sources at the foundry, such as casting finishing, the MACT standards include a building opacity limit.

The GACT standards for area source iron and steel foundries established PM emission limits (as a surrogate for metal HAP) and alternative metal HAP emission limits for metal melting furnaces at ''large'' foundries.[2] The GACT standards for metal melting furnaces at area source foundries are less stringent than the MACT standards for major source foundries and include an allowance to use emissions averaging. Small and large area source iron and steel foundries are required to operate according to scrap selection and inspection requirements to limit the amount of mercury, lead, chlorinated plastics, and free liquids present in the scrap fed to metal melting furnaces and to operate furan warm box mold and core making lines without the use of methanol as a component of the catalyst formulation.

C. What changes did we propose for the Iron and Steel Foundries source categories in our October 9, 2019, proposal?

On October 9, 2019, the EPA published a proposed rule in the **Federal Register** (84 FR 54394) for the Iron and Steel Foundries NESHAP for both major and area sources, 40 CFR part 63, subparts EEEEE and ZZZZZ, that took into consideration the RTR analyses for major sources and the technology review for area sources. In the proposed rule, we proposed that the health risks due to HAP emissions from major source iron and steel foundries

[1] The Court has affirmed this approach of implementing CAA section 112(f)(2)(A): *NRDC* v. *EPA,* 529 F.3d 1077, 1083 (D.C. Cir. 2008) (''If EPA determines that the existing technology-based standards provide an 'ample margin of safety,' then the Agency is free to readopt those standards during the residual risk rulemaking.'').

[2] Existing area source foundries with annual metal melt production exceeding 20,000 tons and new area source foundries with annual metal melt capacity exceeding 10,000 tons are defined as ''large'' foundries; area source foundries at or below these metal melt rates are defined as ''small'' foundries.

are acceptable and that the Iron and Steel Foundries major source NESHAP (40 CFR part 63, subpart EEEEE) provides an ample margin of safety to protect public health and that additional standards are not necessary to prevent an adverse environmental effect. We also proposed that no revisions to the Iron and Steel Foundries major source or area source NESHAP are necessary based on our technology review. We proposed revisions to the SSM provisions of both NESHAP in order to ensure that they are consistent with the Court decision in *Sierra Club* v. *EPA,* 551 F. 3d 1019 (D.C. Cir. 2008). We proposed revisions to the recordkeeping and reporting requirements of both NESHAP to require the use of electronic reporting of performance test reports and semiannual reports. We also proposed to correct a section reference error in the major source NESHAP (40 CFR part 63, subpart EEEEE) and to correct several section reference errors and make other minor editorial revisions to the area source NESHAP (40 CFR part 63, subpart ZZZZZ). For additional information regarding the proposed rule, see the October 9, 2019, proposal (84 FR 54394).

III. What is included in these final rules?

This action finalizes the EPA's determinations pursuant to the RTR provisions of CAA section 112 for the Iron and Steel Foundries major source category and the CAA technology review provisions for the Iron and Steel Foundries area source category. This action also finalizes other changes to the NESHAP, including proposed revisions to SSM requirements, electronic reporting requirements, and editorial corrections. This action also reflects several changes to the October 2019 proposal in consideration of comments received during the public comment period described in section IV of this preamble.

A. What are the final rule amendments based on the risk review for the major source Iron and Steel Foundries source category?

The EPA proposed no changes to Iron and Steel Foundries major source NESHAP based on the risk review conducted pursuant to CAA section 112(f). In this action, we are finalizing our proposed determination that risks from the Iron and Steel Foundries source category are acceptable, the standards provide an ample margin of safety to protect public health, and more stringent standards are not necessary to prevent an adverse environmental effect. The EPA received no new data or other information during the public comment period that causes us to change that proposed determination. Therefore, we are not making any revisions to the existing standards under CAA section 112(f), and we are readopting the existing standards. Further information regarding these decisions are provided in section IV of this preamble.

B. What are the final rule amendments based on the technology review for the Iron and Steel Foundries source categories?

We determined that there are no developments in practices, processes, and control technologies that necessitate revisions to the MACT or GACT standards for these source categories. Therefore, we are not finalizing revisions to the MACT or GACT standards under CAA section 112(d)(6). The analyses and rationale for these decisions are described in section IV of this preamble.

C. What are the final rule amendments addressing emissions during periods of SSM?

We are finalizing amendments to the major source and area source Iron and Steel Foundries NESHAP to remove and revise provisions related to SSM consistent with what we proposed (84 FR 54415) except for the volatile organic HAP (VOHAP) standards during startup and shutdown for cupola melting furnaces at major source iron and steel foundries.[3] With regard to cupola furnaces VOHAP standards, we are removing the SSM exemptions consistent with what we proposed, however, with regard to the VOHAP emissions standards, we are finalizing work practice standards for VOHAP emissions for periods of startup and shutdown based on consideration of public comments instead of applying numeric emissions limits during these periods, as described in more detail below.

In its 2008 decision in *Sierra Club* v. *EPA,* 551 F.3d 1019 (D.C. Cir. 2008), the Court vacated portions of two provisions in the EPA's CAA section 112 regulations governing the emissions of HAP during periods of SSM. Specifically, the Court vacated the SSM exemption contained in 40 CFR 63.6(f)(1) and (h)(1), holding that under section 302(k) of the CAA, emissions standards or limitations must be continuous in nature and that the SSM exemption violates the CAA's requirement that some CAA section 112 standards apply continuously. As explained in section IV.D.1 of the October 2019 proposal preamble (84 FR 54415, October 9, 2019), the EPA proposed that the Iron and Steel Foundries NESHAP would require that the standards apply at all times, consistent with the Court decision in *Sierra Club* v. *EPA,* 551 F. 3d 1019 (D.C. Cir. 2008). Except for cupola melting furnace VOHAP emission limits, the EPA is finalizing the SSM provisions as proposed without setting a separate standard for startup and shutdown as discussed in the October 2019 proposal (84 FR 54415).

For VOHAP emissions from cupola melting furnaces, the EPA is finalizing separate standards during periods of cupola startup and shutdown to address public comments received on the proposed rule. Specifically, the EPA is finalizing amendments to the 20 ppmv VOHAP emission limit to apply only during normal production operations (*e.g.,* when furnace is actively producing molten metal), or more specifically, what the major source NESHAP refers to as ''on blast'' conditions as defined in the rule. With regard to cupola furnace startup and shutdown periods, which are considered part of the ''off blast'' conditions in the major source NESHAP, the EPA is finalizing work practice standards that require compliance with the building opacity limit during initial cupola startup procedures (*e.g.,* refractory curing, cupola bed preparation, and beginning stage of cupola coke bed preparation) and final shutdown procedures (*e.g.,* cooling and cupola banking or bottom drop). For other startup, shutdown, and idling periods, the EPA is finalizing work practice standards requiring that owners/operators (1) begin operating the cupola afterburner or other thermal combustion device as soon as practicable after beginning the coke bed preparatory step but no later than 30 minutes after the blast air is started to begin the coke bed burn-in and (2) operate the afterburner or other thermal combustion device with a flame present at all times during other off blast periods. Furthermore, we are requiring facilities to operate according to procedures to minimize emissions and ensure safety during all of these periods as specified in the operation and maintenance (O&M) plan. We are finalizing new definitions of ''cupola startup'' and ''cupola shutdown'' to

[3] The 20 parts per million by volume (ppmv) VOHAP emission limit for cupola melting furnaces applies only to major source iron and steel foundries (40 CFR part 63, subpart EEEEE). The area source NESHAP only regulates metal HAP emissions from melting furnaces so the SSM revisions for 40 CFR part 63, subpart ZZZZZ, are being finalized as proposed without exception.

clarify when these work practice standards apply and adding recordkeeping requirements for facilities to demonstrate compliance with the new work practice standards. We also added monitoring and recordkeeping requirements for foundry owners or operators to demonstrate compliance with the new work practice standards. More detail regarding these revisions from the proposal are provided in section IV.C of this preamble.

Further, the EPA is not finalizing separate standards for malfunctions. We are finalizing provisions in the final rule consistent with our proposal with regard to malfunctions (see 84 FR 54415). As discussed in the October 2019 proposal preamble, the EPA interprets CAA section 112 as not requiring emissions that occur during periods of malfunction to be factored into development of CAA section 112 standards, although the EPA has the discretion to set standards for malfunctions where feasible. For this action, it is unlikely that a malfunction would result in a violation of the standards, and no comments were submitted that would suggest otherwise. Refer to section IV.D.1 of the proposal preamble for further discussion of the EPA's rationale for the decision not to set separate standards for malfunctions, as well as a discussion of the actions a source could take in the unlikely event that a source fails to comply with the applicable CAA section 112(d) standards as a result of a malfunction event, given that administrative and judicial procedures for addressing exceedances of the standards fully recognize that violations may occur despite good faith efforts to comply and can accommodate those situations.

As is explained in more detail below, we are finalizing revisions to the General Provisions table to 40 CFR part 63, subparts EEEEE and ZZZZZ, to eliminate requirements that include rule language providing exemptions for periods of SSM. Additionally, we are finalizing our proposal to eliminate language related to SSM that treats periods of startup and shutdown the same as periods of malfunction, as explained further below. Finally, we are finalizing our proposal to revise the Deviation Notification Report and related records as they relate to malfunctions, as described below. As discussed in the October 2019 proposal preamble, these revisions are consistent with the requirement that the standards apply at all times. Refer to sections III.D.1 through 5 of the October 2019 proposal preamble for a detailed discussion of these amendments (see 84 FR 54415).

D. What other changes have been made to the NESHAP?

The EPA is requiring owners or operators of iron and steel foundries to submit electronic copies of certain required performance test reports, performance evaluation reports, and semiannual reports through the EPA's Central Data Exchange using the Compliance and Emissions Data Reporting Interface (CEDRI). The final rule requires that performance test results and performance evaluation results be submitted using the Electronic Reporting Tool. For semiannual reports, the final rule requires that owners or operators use the appropriate spreadsheet template to submit information to CEDRI. The final version of the templates for these reports are located on the CEDRI website.[4]

The electronic submittal of the reports addressed in this rulemaking will increase the usefulness of the data contained in those reports, is in keeping with current trends in data availability and transparency, will further assist in the protection of public health and the environment, will improve compliance by facilitating the ability of regulated facilities to demonstrate compliance with requirements and by facilitating the ability of delegated state, local, tribal, and territorial air agencies and the EPA to assess and determine compliance, and will ultimately reduce burden on regulated facilities, delegated air agencies, and the EPA. Electronic reporting also eliminates paper-based, manual processes, thereby saving time and resources, simplifying data entry, eliminating redundancies, minimizing data reporting errors, and providing data quickly and accurately to the affected facilities, air agencies, the EPA and the public. For a more thorough discussion of electronic reporting, see the memorandum, *Electronic Reporting Requirements for New Source Performance Standards (NSPS) and National Emission Standards for Hazardous Air Pollutants (NESHAP) Rules,* available in Docket ID No. EPA–HQ–OAR–2019–0373.

E. What are the effective and compliance dates of the standards?

We proposed that all of the SSM revisions would become effective upon promulgation. The SSM revisions to the area source NESHAP being promulgated in this action are effective on September 10, 2020, as proposed. The SSM revisions to the General Provisions table in major source NESHAP (Table 1 to subpart EEEEE of part 63) being promulgated in this action are also effective on September 10, 2020, as proposed. However, as previously noted in section III.C of this preamble, we are finalizing new work practice standards specific to cupola startup and shutdown. Therefore, we are providing 180 days for facilities to transition to these new requirements and retaining specific provisions within the major source NESHAP at 40 CFR 63.7720 regarding SSM for this 180-day transition period. As proposed, we are also providing 180 days for facilities to transition to the electronic reporting requirements. As such, revisions for selected SSM provisions and for the electronic reporting requirements being promulgated in this action are effective on March 9, 2021.

IV. What is the rationale for our final decisions and amendments for the Iron and Steel Foundries source categories?

For each issue, this section provides a description of what we proposed and what we are finalizing for the issue, the EPA's rationale for the final decisions and amendments, and a summary of key comments and responses. For all comments not discussed in this preamble, comment summaries and the EPA's responses can be found in the comment summary and response document titled *National Emission Standards for Hazardous Air Pollutants: Iron and Steel Foundries Major Source Residual Risk and Technology Review and Area Source Technology Review—Final Rule—Summary of Public Comments and Responses,* which is available in the docket (Docket ID No. EPA–HQ–OAR–2019–0373).

A. Residual Risk Review for the Major Source Iron and Steel Foundries Source Category

1. What did we propose pursuant to CAA section 112(f) for the major source Iron and Steel Foundries source category?

We proposed that the health risks due to emissions of HAP from the major source Iron and Steel Foundries source category are acceptable and that the NESHAP provides an ample margin of safety to protect public health and that no additional standards are necessary to prevent an adverse environmental effect.

Table 2 of this preamble provides a summary of the results of the inhalation risk assessment for the source category. More detailed information on the risk assessment can be found in the *Residual Risk Assessment for the Iron and Steel Foundries Major Source Category in*

[4] *https://www.epa.gov/electronic-reporting-air-emissions/cedri.*

Support of the 2020 Risk and Technology Review Final Rule document, available in the docket for this action.

TABLE 2—IRON AND STEEL FOUNDRIES SOURCE CATEGORY INHALATION RISK ASSESSMENT RESULTS

Number of facilities [1]	Maximum individual cancer risk (in 1 million) [2]		Population at increased risk of cancer ≥ 1-in-1 million		Annual cancer incidence (cases per year)		Maximum chronic noncancer TOSHI [3]		Maximum screening acute noncancer HQ [4]
	Based on . . .		Based on . . .		Based on . . .		Based on . . .		
	Actual emissions level	Allowable emissions level	Actual emissions level	Allowable emissions level	Actual emissions level	Allowable emissions level	Actual emissions level	Allowable emissions level	Based on actual emissions level
46	50	50	144,000	144,000	0.02	0.02	0.5 (spleen)	0.5 (spleen)	HQ_{REL} = 1 (arsenic).

[1] Number of facilities evaluated in the risk analysis.
[2] Maximum individual excess lifetime cancer risk due to HAP emissions from the source category.
[3] Maximum target organ-specific hazard index (TOSHI). The target organ system with the highest TOSHI for the source category is respiratory. The respiratory TOSHI was calculated using the California EPA (CalEPA) chronic reference exposure level (REL) for acrolein.
[4] The maximum estimated acute exposure concentration was divided by available short-term dose-response values to develop an array of hazard quotient (HQ) values. HQ values shown use the lowest available acute dose-response value, which in most cases is the REL. When an HQ exceeds 1, we also show the HQ using the next lowest available acute dose-response value.

As shown in Table 2, for the major source Iron and Steel Foundries source category, the maximum cancer risk to the individual most exposed is 50-in-1 million due to actual emissions or allowable emissions. This risk is less than 100-in-1 million, which is the presumptive upper limit of acceptable risk. The estimated incidence of cancer due to inhalation exposures for the source category is 0.02 excess cancer cases per year, or one excess case every 50 years. We estimated that approximately 144,000 people face an increased cancer risk greater than or equal to 1-in-1 million due to inhalation exposure to HAP emissions from this source category. The Agency estimated that the maximum chronic noncancer TOSHI from inhalation exposure, 0.5 (spleen), is less than 1. The screening assessment of worst-case acute inhalation impacts estimated a maximum acute HQ of 1 (due to arsenic) based on the REL.

With regard to multipathway human health risks, we estimated the maximum cancer risk for the highest exposed individual is 20-in-1 million (due to polycyclic organic matter (POM)) and the maximum noncancer chronic HQs are less than 1 for all the HAP known to be persistent and bio-accumulative in the environment (PB–HAP).

A screening-level evaluation of the potential adverse environmental risk associated with emissions of arsenic, cadmium, dioxins, hydrogen chloride, hydrogen flouride, lead, mercury, and POM indicated that no ecological benchmarks were exceeded. Considering all the health risk information and factors discussed above, the EPA proposed that the risks are acceptable and that no additional standards are necessary to prevent an adverse environmental effect.

Under the ample margin of safety analysis, we evaluated the cost and feasibility of available control technologies and other measures that could be applied to further reduce the risks (or potential risks) due to emissions of HAP from the source category. The main control we evaluated to reduce organic HAP emissions was carbon adsorption as a possible add-on control to further reduce VOHAP and associated risks from mold- and core-making and pouring, cooling and shakeout lines at existing sources. The main control we evaluated to reduce metal HAP emissions was improved capture of fugitive PM emissions from scrap handling and melting furnaces and routing them to fabric filter control devices.

We estimated the cost of the additional controls to reduce organic HAP emissions would be $12,700 per ton of organic HAP reduced or greater and would require a capital investment exceeding $27 million. With regard to risk reductions, we estimated the maximum individual risk (MIR) would be reduced from 50-in-1 million to 30-in-1 million, and the number of people with risks ≥ 1-in-1 million would also be reduced.

We estimated the cost of the improved capture and control to reduce metal HAP emissions would be almost $800,000 per ton metal HAP reduced and would require a capital investment of $23 million. With regard to risk reductions, we estimated the HAP metals contribution to the MIR would be reduced from 30-in-1 million to 3-in-1 million, and the number of people with risks ≥ 1-in-1 million would also be reduced.

Based on consideration of the costs and cost effectiveness of both the organic HAP and metal HAP emission control systems, consideration of potential impacts to small businesses, the moderate risk reductions that would be achieved, and the uncertainties in the emissions estimates, we proposed that the Iron and Steel Foundries major source NESHAP provides an ample margin of safety to protect public health, and we did not propose any changes to the NESHAP based on the risk review. For more details regarding the risk review, including the ample margin of safety analysis, see the proposal preamble (84 FR 54398).

2. How did the risk review change for the major source Iron and Steel Foundries source category?

The EPA has not made any changes to either the risk assessments or our determinations regarding risk acceptability, ample margin of safety, or adverse environmental effects for the major source Iron and Steel Foundries source category since the proposal was published on October 9, 2019. We are finalizing the risk review as proposed with no changes (84 FR 54394, October 9, 2019).

3. What key comments did we receive on the risk review, and what are our responses?

Comment: Several commenters agreed with the EPA's conclusion that risks from iron and steel foundry emissions are acceptable and that the current standards provide an ample margin of safety, but they suggested that the emissions data used by the EPA are outdated and flawed and that actual emissions are lower, which would result in even lower risk projections. They also stated that the costs of additional controls were significantly understated. According to the commenters, the higher cost coupled with lower emissions, which would also lower the estimated emission reductions, demonstrates that additional controls are not cost effective. On the other hand, one commenter opposed the risk conclusions stating that the EPA did not fully consider fugitive emissions.

Response: Regarding comments on the accuracy and completeness of the emissions and cost estimates, we used the best available emissions data in our risk assessment. We consider the emissions and release characteristics

used in the risk assessment to be reasonable and appropriate for the analysis conducted. It is clear that fugitive emission sources were included as several of these sources were driving the risk estimates for most facilities. We intentionally conducted a screening assessment of control measures using best-case (lowest cost) assumptions to determine whether, under ideal conditions, these controls might be cost effective. Based on the results of our screening analysis, we concluded that the controls were not warranted based on costs and that more detailed analyses of these control systems were not necessary (for more details see the preamble of the proposed rule, 84 FR 54412, October 9, 2019).

Comment: One commenter opposed the risk acceptability conclusion stating that the EPA significantly underestimated the risk because the EPA's Residual Risk Assessment failed to follow the best available science, including:

(1) Underestimating health threats to children and from early-life exposure by ignoring increased risk in childhood and from prenatal exposure;

(2) underestimating health threats to communities exposed to multiple sources by refusing to add factors to account for the increased risks caused by such exposure;

(3) underestimating health threats by refusing to assess health risks at all for pollutants such as lead and refusing to assess multipathway risks for additional emitted persistent bioaccumulative pollutants such as toxic metals like chromium (VI), nickel, beryllium, antimony, and manganese; and

(4) underestimating the cancer, chronic noncancer, and acute health risks by using modeling assumptions that ignore real-world exposures, underestimating risk from chemicals such as benzene, 1,3-butadiene, nickel, manganese, and lead due to the EPA's refusal to follow the best available science and ignoring the more protective health values created by CalEPA's Office of Environmental Health Hazard Assessment (OEHHA).

Response: The EPA disagrees with the commenter's claim that the risk assessment for this source category does not consider the groups that may be most at risk (*e.g.,* children and developing fetuses). When the EPA derives dose-response values for HAP, it considers the most sensitive populations identified in the available literature, and these are the values used in the Agency's risk assessments.[5] The EPA has an approach for selecting appropriate health benchmark values and, in general, this approach places greater weight on the EPA-derived health benchmarks than those from other agencies for the reasons explained in the document titled *Residual Risk Assessment for the Iron and Steel Foundries Major Source Category in Support of the 2020 Risk and Technology Review Final Rule,* available in the docket (Docket ID No. EPA–HQ–OAR–2019–0373). Additionally, the approach of favoring the EPA benchmarks (when they exist) has been endorsed by the Science Advisory Board (SAB) and ensures the use of values most consistent with well-established and scientifically-based EPA science policy. The EPA continually evaluates other benchmarks, including CalEPA OEHHA child-specific reference doses (RfDs) and more recent inhalation RELs[6] in the context of assessing risk from exposure to HAP.

With respect to cancer, the EPA uses an age-dependent adjustment factor approach referred to by the commenter but limits the application of age-dependent adjustment factors to carcinogenic pollutants that are known to act via mutagenic mode of action (MOA); in contrast, the CalEPA OEHHA approach is to apply adjustment factors across the board for all carcinogens, regardless of MOA. In lieu of chemical-specific data on which age or life-stage specific risk estimates or potencies can be determined, default age-dependent adjustment factors can be applied when assessing cancer risk for early-life exposures to chemicals that cause cancer through a mutagenic MOA. With regard to other carcinogenic pollutants (*e.g.,* non-mutagenic) for which early-life susceptibility data are lacking, it is the Agency's long-standing science policy position that use of the linear low-dose extrapolation approach (without further adjustment) provides adequate public health conservatism in the absence of chemical-specific data indicating differential early-life susceptibility or when the MOA is not mutagenicity.[7] The basis for this methodology is provided in the EPA's 2005 *Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens.*[8]

The EPA also disagrees with the commenter that a children's default safety factor of 10 or more should be added to the EPA's reference values in response to the 10X factor enacted by Congress in the Food Quality Protection Act (FQPA) in 1996.[9] [10] In response to the EPA noncancer reference value derivation, the Agency evaluated the methods for considering children's risk in the development of reference values. As part of the response, the EPA (*i.e.,* the Science Policy Council and Risk Assessment Forum) established the RfD/reference concentration (RfC) Technical Panel to develop a strategy for implementing the FQPA and examine the issues relative to protecting children's health and application of the 10X safety factor. One of the outcomes of the Technical Panel's efforts was an in-depth review of a number of issues related to the RfD/RfC process.[11] The most critical aspect in the derivation of a reference value pertaining to the FQPA has to do with variation between individual humans and is accounted for by a default UF when no chemical-specific data are available. The EPA reviewed the default UF for inter-human variability and found the EPA's default value of 10 adequate for all susceptible populations, including children and infants. The EPA also recommended the use of chemical-specific data in preference to default UFs when available[12] and has developed Agency guidance to facilitate consistency in the development and use of data-derived extrapolation factors for RfCs and RfDs.[13] Additionally, the EPA also

[6] More recently published OEHHA RELs use a more protective set of inter-individual uncertainty factors (UFs), with a default of 30 as opposed to the EPA default of 10 with the intent of protecting for more susceptible individuals, most notably children.

applies a database UF, which is intended to account for the potential for deriving an under protective RfD/RfC as a result of an incomplete characterization of the chemical's toxicity. In addition to the identification of toxicity information that is lacking, review of existing data may also suggest that a lower reference value might result if additional data were available.

In conclusion, the estimated risks must also be considered in the context of the full set of assumptions used for this risk assessment. The EPA's dose-response values for HAP are considered plausible upper-bound estimates with an appropriate age-dependent adjustment factor. The EPA's chronic noncancer reference values have been derived considering the potential susceptibility of different subgroups, with specific consideration of children. An extra 10-fold UF is not needed in the RfC/RfD methodology because the currently applied factors are considered sufficient to account for uncertainties in the database from which the reference values are derived.

Regarding the commenter's assertion that the EPA has underestimated health threats to communities exposed to multiple sources, the EPA typically examines facility-wide risks to provide additional context to the source category risks. The development of facility-wide risk estimates provides additional information about the potential cumulative risks in the vicinity of the RTR sources, as one means of informing potential risk-based decisions about the RTR source category in question. Because these risk estimates were derived from facility-wide emissions estimates that have not generally been subjected to the same level of engineering review as the source category emission estimates, they may be less certain than the risk estimates for the source category in question, but they remain important for providing context as long as their uncertainty is taken into consideration in the process.

The EPA notes that section 112(f)(2) of the CAA expressly preserves the EPA's use of the two-step process for developing standards to address residual risk and interpret ''acceptable risk'' and ''ample margin of safety'' as developed in the Benzene NESHAP. In the Benzene NESHAP, the EPA rejected approaches that would have mandated consideration of background levels of pollution in assessing the acceptability of risk, concluding that ''With respect to considering other sources of risk from benzene exposure and determining the acceptable risk level for all exposures to benzene, the EPA considered this inappropriate because only the risk associated with the emissions under consideration are relevant to the regulation being established and, consequently, the decisions being made.'' (54 FR 38044, September 14, 1989). The EPA's authority to use the two-step process laid out in the Benzene NESHAP, and to consider a variety of measures of risk to public health, is discussed more thoroughly in the preamble to the proposed rule. Nothing in the CAA or the Benzene NESHAP in any way forecloses the EPA from considering facility-wide risks in making a determination under CAA section 112(f)(2), as such information can constitute relevant health information. Although not considered in the determination of acceptable risk, the EPA notes that background risks or contributions to risk from sources outside the source category under review could be one of the relevant factors considered in the ample margin of safety determination, along with cost and economic factors, technological feasibility, and other factors.

The EPA acknowledges it does not have screening values for some of the PB–HAP but the EPA disagrees that the multipathway assessment is inadequate. In the Air Toxics Assessment Library (available at: *https://www.epa.gov/fera/risk-assessment-and-modeling-air-toxics-risk-assessment-reference-library*), the EPA developed the current PB–HAP list considering all of the available information on persistence and bioaccumulation. This list reviewed HAP identified as PB–HAP by other EPA program offices (*e.g.,* the Great Waters Program). This list was peer-reviewed by the SAB and found to be acceptable and, therefore, the EPA considers it to be reasonable for use in the RTR program. Based on these sources and the limited available information on the persistence and bioaccumulation of other HAP, the EPA does not think that the potential for multipathway risk from other HAP rises to the level of the PB–HAP currently on the list.

The EPA disagrees that it has failed to assess potential risks from lead. As for other pollutants included in the assessment of noncancer hazard from inhalation, RTR assessments include lead in the calculation of TOSHIs. For lead, neurological and developmental TOSHIs are calculated. In these indices, modeled concentrations of lead are compared to the 2008 lead National Ambient Air Quality Standards (NAAQS) (which was reviewed and retained in 2016),[14] and other pollutant concentrations are compared to their respective noncancer reference values, then the individual pollutant HQs are summed to calculate the TOSHIs. To assess the potential for hazard from multipathway exposures, modeled air concentrations are compared to the lead NAAQS. The EPA notes that in developing the NAAQS for lead, air-related multipathway effects were already taken into account. That is, as noted at 73 FR 66971, ''As was true in the setting of the current standard, multimedia distribution of and multipathway exposure to Pb that has been emitted into the ambient air play a key role in the Agency's consideration of the Pb NAAQS.''

While recognizing that lead has been demonstrated to exert ''a broad array of deleterious effects on multiple organ systems,'' the lead NAAQS targets the effects associated with relatively lower exposures and associated blood lead levels, specifically nervous system effects in children including cognitive and neurobehavioral effects (73 FR 66976). The 2008 decision on the lead NAAQS was informed by an evidence-based framework for neurocognitive effects in young children. In applying the evidence-based framework, the EPA focused on a subpopulation of U.S. children, those living near air sources and more likely to be exposed at the level of the standard; to the same effect see 73 FR 67000/3—''The framework in effect focuses on the sensitive subpopulation that is the group of children living near sources and more likely to be exposed at the level of the standard. The evidence-based framework estimates a mean air-related IQ loss for this subpopulation of children; it does not estimate a mean for all U.S. children''; 73 FR 67005/1—''the air-related IQ loss framework provides estimates for the mean air-related IQ loss of a subset of the population of U.S. children, and there are uncertainties associated with those estimates. It provides estimates for that subset of children likely to be exposed to the level of the standard, which is generally expected to be the subpopulation of children living near sources who are likely to be most highly exposed.'' In addition, in reviewing and sustaining the lead primary NAAQS, the EPA notes that the Court specifically noted that the rule was targeted to protect children living near lead sources: ''EPA explained that the scientific evidence

Intraspecies Extrapolation. EPA/100/R–14/002F. *https://www.epa.gov/risk/guidance-applying-quantitative-data-develop-data-derived-extrapolation-factors-interspecies-and.*

[14] *https://www.epa.gov/lead-air-pollution/national-ambient-air-quality-standards-naaqs-lead-pb.*

showing the impact of lead exposure in young children in the United States led it 'to give greater prominence to children as the sensitive subpopulation in this review' and to focus its revision of the lead NAAQS on the 'sensitive subpopulation that is the group of children living near [lead emission] sources and more likely to be exposed at the level of the standard.' Given the scientific evidence on which it relied, the EPA's decision to base the revised lead NAAQS on protecting the subset of children likely to be exposed to airborne lead at the level of the standard was not arbitrary or capricious.'' *Coalition of Battery Recyclers,* 604 F. 3d at 618.

Regarding the comment that the EPA underestimates the cancer, chronic noncancer, and acute health risks by using modeling assumptions that ignore real-world exposures, underestimating risk from other chemicals such as benzene, 1,3-butadiene, nickel and manganese, due to the EPA's refusal to follow the best available science and ignoring the more protective health values created by CalEPA's OEHHA, the EPA uses dose-response information that has been obtained from various sources. As noted above, the dose-response information is prioritized according to (1) conceptual consistency with the EPA's risk assessment guidelines and (2) level of public and peer review received. The prioritization process is aimed at incorporating into RTR assessments the best available science with respect to dose-response information. Application of this approach generally results in the following priority order: (1) U.S. EPA IRIS, (2) Agency for Toxic Substances and Disease Registry (ATSDR), (3) CalEPA, and (4) other sources. Deviations from this prioritization only occur if there are concerns that the top priority values have become outdated or newer evidence suggests they are not protective; such was not the case for the values used in this RTR assessment. Based on this approach, the EPA determined that the best available science was used in the risk assessment, that the risks are acceptable, that the existing standards provide an ample margin of safety to protect public health, and that no changes are needed from the proposal based on this comment.

4. What is the rationale for our final approach and final decisions for the risk review?

As noted in our proposal, the EPA sets standards under CAA section 112(f)(2) using ''a two-step standard-setting approach, with an analytical first step to determine an 'acceptable risk' that considers all health information, including risk estimation uncertainty, and includes a presumptive limit on MIR of approximately 1-in-10 thousand'' (see 54 FR 38045, September 14, 1989). We weigh all health risk factors in our risk acceptability determination, including the cancer MIR, cancer incidence, the maximum chronic noncancer TOSHI, the maximum acute noncancer HQ, the extent of noncancer risks, the distribution of cancer and noncancer risks in the exposed population, and the risk estimation uncertainties.

In the second step of the approach, the EPA considers whether the emissions standards provide an ample margin of safety to protect public health ''in consideration of all health information, including the number of persons at risk levels higher than approximately 1-in-1 million, as well as other relevant factors, including costs and economic impacts, technological feasibility, and other factors relevant to each particular decision.'' *Id.* We evaluated additional control measures to reduce the number of persons exposed at risk levels higher than approximately 1-in-1 million and determined that these additional control measures were not reasonable considering the costs and economic impacts. Therefore, we concluded that the major source Iron and Steel Foundries NESHAP provides an ample margin of safety to protect public health without any revisions. After conducting the ample margin of safety analysis, we consider whether a more stringent standard is necessary to prevent, taking into consideration costs, energy, safety, and other relevant factors, an adverse environmental effect.

We evaluated all of the comments on the risk review and determined that no changes to the review are needed. For the reasons explained in the proposal, we determined that the risks from the major source Iron and Steel Foundries source category are acceptable, the current standards provide an ample margin of safety to protect public health, and more stringent standards are not necessary to prevent an adverse environmental effect. Therefore, pursuant to CAA section 112(f)(2), we are finalizing our residual risk review as proposed and readopting the standards for the major source Iron and Steel Foundries source category.

B. Technology Review for the Iron and Steel Foundries Source Categories

1. What did we propose pursuant to CAA section 112(d)(6) for the Iron and Steel Foundries source categories?

Pursuant to CAA section 112(d)(6), we proposed to conclude that no revisions to the current major source or area source NESHAP for Iron and Steel Foundries are necessary. Based on our technology review described in the October 9, 2019, proposal (84 FR 54414), we determined that there are no developments in practices, processes, or control technologies that necessitate revisions to the NESHAP for major source Iron and Steel Foundries (40 CFR part 63, subpart EEEEE) or the NESHAP for area source Iron and Steel Foundries (40 CFR part 63, subpart ZZZZZ).

2. How did the technology review change for the Iron and Steel Foundries source categories?

The EPA has not made any changes to the technology review since the proposal was published on October 9, 2019. We are finalizing the technology review as proposed with no changes.

3. What key comments did we receive on the technology reviews, and what are our responses?

Comment: Several commenters agreed with the EPA's proposed technology review conclusions. Other commenters suggested that the EPA needed to revise the standards because the EPA specifically considered the National Vehicle Mercury Switch Recovery Program (NVMSRP) to be a ''development'' with respect to the major source MACT standards. These commenters also suggested that the EPA should consider fugitive control measures required by Bay Area Air Quality Management District (''BAAQMD'') and South Coast Air Quality Management District (''SCAQMD'') standards and work practices considered in the EPA's proposed Integrated Iron and Steel Manufacturing RTR proposed rule (84 FR 42704, August 16, 2019) to be ''developments'' for major and area source foundries and take these into account in this rulemaking.

Response: As an initial matter, CAA section 112(d)(6) does not require the EPA to revise the standards if a ''development'' is identified, but to consider whether it is necessary to revise the standards in light of the developments. While we acknowledge that the NVMSRP was initiated after the major source rule (40 CFR part 63, subpart EEEEE) was promulgated, we note that the major source rule includes

requirements to remove mercury switches from automotive scrap consistent with the NVMSRP and that it acted as a catalyst for the development of the NVMSRP. Because the major source rule already requires mercury switch removal consistent with this ''development,'' no additional revisions to the major source rule were deemed ''necessary.'' With respect to additional fugitive emissions requirements, we specifically assessed adding improved capture and control requirements to reduce emissions of fugitive metal HAP emissions similar to those suggested by the commenter (see *Control Cost Estimates for Metal HAP Emissions from Iron and Steel Foundries,* which is available in the docket as Docket Item No. EPA–HQ–OAR–2019–0373–0015). We concluded that these control measures were not cost effective and that it was not necessary to revise the rule to reduce fugitive metal HAP emissions. Thus, we maintain our conclusion that it is not necessary to revise the standards based on the developments cited by the commenter.

4. What is the rationale for our final approach for the technology reviews?

We evaluated all of the comments on the technology reviews and determined that no changes to the reviews are needed. Therefore, pursuant to CAA section 112(d)(6), we are finalizing our technology reviews as proposed.

C. Removal of the SSM Exemptions

1. What did we propose?

The EPA proposed amendments to the major and area source Iron and Steel Foundries NESHAP to remove the provisions related to SSM in order to ensure that they are consistent with the Court decision in *Sierra Club* v. *EPA,* 551 F. 3d 1019 (D.C. Cir. 2008) that standards apply at all times. As detailed in the October 2019 proposal, we proposed the following amendments.

- Revising the General Provisions applicability tables (Table 1 to subpart EEEEE of part 63 and Table 3 to subpart ZZZZZ of part 63) to change the following entries from a ''yes'' in column 3 (indicating the provision applies) to a ''no'':
  - 40 CFR 63.6(e)
  - 40 CFR 63.6(f)(1)
  - 40 CFR 63.6(h)(1)
  - 40 CFR 63.7(e)(1)
  - 40 CFR 63.8(c)(1)(i) and (iii)
  - 40 CFR 63.8(d)(3)
  - 40 CFR 63.10(b)(2)(i), (ii), (iv), and (v)
  - 40 CFR 63.10(c)(7) [for subpart EEEEE]; 40 CFR 63.10(c) [for subpart ZZZZZ]
  - 40 CFR 63.10(d)(5)
  - 40 CFR 63.10(e)(3) [for subpart ZZZZZ; subpart EEEEE already indicates ''no'']
- Revising the following paragraphs in 40 CFR part 63, subpart EEEEE, to remove the language in the rule that exempted affected sources from compliance with the standards during periods of SSM, as well as references to General Provision sections or requirements that no longer apply.
  - 40 CFR 63.7710(a) to remove reference to 40 CFR 63.6(e)(1)(i)
  - 40 CFR 63.7720(a) to delete the phrase ''. . ., except during periods of startup, shutdown, or malfunction''
  - 40 CFR 63.7720(c) to delete and reserve the paragraph
  - 40 CFR 63.7746(b) to delete and reserve the paragraph
  - 40 CFR 63.7751(b)(4) and (c) to delete and reserve the paragraphs
  - 40 CFR 63.7752(a)(2) to remove reference to 40 CFR 63.6(e)(3) and require records require by 40 CFR 63.10(b)(2)(iii)
  - 40 CFR 63.7752(b)(4) to remove the records needed to indicate whether deviation of a continuous emission monitoring system occurred during periods of SSM
- Revising the following paragraphs in 40 CFR part 63, subpart ZZZZZ, to remove references to General Provision sections or requirements that no longer apply.
  - 40 CFR 63.10890(i) [re-designated to 40 CFR 63.10890(j)] to remove reference to 40 CFR 63.6(e)
  - 40 CFR 63.10897(g) to remove reference to minimizing periods of SSM
  - 40 CFR 63.10899(b) to revise the general reference to records required by 40 CFR 63.10 to specify that only records required by 40 CFR 63.10(b)(2)(iii), (vi) through (xiv), and (b)(3) are necessary
- Adding 40 CFR 63.7752(d) of subpart EEEEE and 40 CFR 63.10899(b)(15) of subpart ZZZZZ to specify recordkeeping requirements during a malfunction.
- Revising 40 CFR 63.7751(b)(7) and (8) of subpart EEEEE and 40 CFR 63.10899(c) of subpart ZZZZZ to specify reporting requirements for specific deviations.

We proposed that the effective date of these revisions be the date of promulgation of the final rule. More information concerning the elimination of SSM provisions is in the preamble to the proposed rule (84 FR 54415–44419, October 9, 2019).

2. What changed since proposal?

For the area source rule (40 CFR part 63, subpart ZZZZZ), we are finalizing the revisions to the SSM provisions as proposed with no changes. For the major source rule (40 CFR part 63, subpart EEEEE), we are finalizing most revisions regarding SSM provisions as proposed such that the emission limits apply at all times without the need for different standards during periods of startup and shutdown. However, for new and existing major source cupola melting furnaces, we are finalizing specific work practice standards for VOHAP emissions that apply during startup and shutdown. For cupola melting furnaces, we are finalizing that the 20 ppmv VOHAP emission limit in 40 CFR 63.7690(a)(8) applies only while the cupola is ''on blast'' (normal operations) and we are adding work practice standards at 40 CFR 63.7700(g) to limit VOHAP emissions during periods of off blast, which includes startup, shutdown, or idling. We are adding reference to these new work practice standards in 40 CFR 63.7710(b) so that the O&M plan specifically covers the capture and control systems used to comply with the new work practice standards. We are adding reference to these new work practice standards at 40 CFR 63.7740(e) and 63.7741(d) to require temperature monitoring to demonstrate that the afterburner or other thermal combustion device flame is present as required in 40 CFR 63.7700(g)(2)(i). We are also adding additional recordkeeping requirements at 40 CFR 63.7744(e) for facilities to demonstrate continuous compliance with the new work practice standards. These records include: Combustion zone temperature for the cupola's thermal combustion control device, the time blast air is started to begin the coke bed burn-in, the time the cupola afterburner or other thermal combustion device is lit, the time metal production starts during cupola startup, the time when metal production ends, the time slag removal was completed, the time the afterburner or other thermal combustion device is turned off during cupola shutdown, and the times idling starts and stops.

With regard to compliance dates, we are providing 180 days to comply with these new work practice standards for major source iron and steel foundries and also for the SSM related provisions in 40 CFR 63.7720 including provisions that state the emission limits apply at all times. We are retaining the rule-specific SSM provisions from the original NESHAP (including the requirement to have an SSM plan) for the first 180 days until the compliance date for the new work practice standards becomes effective. For other proposed SSM

revisions in the major source rule and for all of the proposed SSM revisions in that area source rule, which are predominately revisions to General Provisions applicability tables, we are finalizing requirements that foundry owners or operators will need to comply with these revisions on the date this final rule is published in the **Federal Register**.

3. What are the key comments and what are our responses?

Comments: Several commenters supported the proposed removal of the SSM exemptions. One commenter indicated that meeting the parametric monitoring requirement of 1,300 degrees Fahrenheit for afterburners that are used to control VOHAP emissions from cupola furnaces is likely to be an issue during cupola startup and shutdown and recommended new definitions of ''cupola startup'' and ''cupola shutdown,'' and revisions to the definition of ''off blast'' as follows:

Cupola Startup means the time beginning when molten metal is first tapped from a cupola that had previously been shut down.

Cupola Shutdown means the time ending once the last charge is added to the cupola preceding either cupola banking or cupola bottom drop.

Off Blast means those periods of cupola operation when the cupola is not actively being used to produce molten metal. Off blast conditions also include idling conditions when the blast air is turned off or down to the point that the cupola does not produce additional molten metal.

The same commenter recommended that the compliance date related to SSM-related rule changes be revised to 180 days after the date of the final rule for both subparts EEEEE and ZZZZZ of 40 CFR part 63 to allow facilities sufficient time to extract O&M plans that may be integrated with SSM plans as well as to develop other facility-specific procedures to address amended rule requirements related to SSM events.

Response: As discussed in the preamble to the October 2019 proposal (84 FR 54415, October 9, 2019), we acknowledged that the cupola afterburners would not be able to meet the 1,300 degrees Fahrenheit parametric monitoring temperature limit during off blast conditions, but we expected that the emissions would still be compliant with the 20 ppmv VOHAP emission limit. Therefore, initially, we did not understand why the new definitions would be helpful or necessary. So, we contacted the commenter to seek clarification of their comments. On February 12, 2020, we had a teleconference meeting with the commenter to try to better understand the issue. The notes of the meeting are in the docket for this rulemaking (Docket ID No. EPA–HQ–OAR–2019–0373). On March 9, 2020, the commenter provided a document providing further detail of the cupola startup and shutdown procedures and suggested work practices as an alternative to the suggested definitions (see email from Jeff Hannapel to Phil Mulrine dated March 9, 2020, included in Docket ID No. EPA–HQ–OAR–2019–0373). On April 2, 2020, we had an additional teleconference meeting with the commenter to discuss the information provided in the March 9, 2020, email. The notes of this meeting are also in the docket for this rulemaking (Docket ID No. EPA–HQ–OAR–2019–0373).

During the meetings, the commenter clarified that their main concern was the VOHAP emissions limit, not the temperature limit. They explained that there is uncertainty as to whether the cupola furnaces would meet the VOHAP limit during these periods and that no one has ever tested emissions during these periods. We also learned that the definitions suggested by the commenter were intended to remove preparatory steps from what was considered startup because of the uncertainty regarding whether they would be able to meet the VOHAP emissions limit during those periods. However, as some of these preparatory steps have the potential to emit VOHAP, we concluded that the suggested definitions were not consistent with the 2008 Court decision in *Sierra Club* v. *EPA,* 551 F. 3d 1019 (D.C. Cir. 2008).

Based on our improved understanding of the startup and shutdown procedures for the cupola furnace and related issues, we have determined that work practice standards are appropriate for these periods. As noted in CAA section 112(h)(1), ''if it is not feasible in the judgment of the Administrator to prescribe or enforce an emission standard for control of a hazardous air pollutant or pollutants, the Administrator may, in lieu thereof, promulgate a design, equipment, work practice, or operational standard, or combination thereof, which in the Administrator's judgment is consistent with the provisions of subsection (d) or (f).'' CAA section 112(h)(2) defines the phrase ''not feasible to prescribe or enforce an emission standard'' as any situation in which the Administrator determines that either ''a hazardous air pollutant or pollutants cannot be emitted through a conveyance designed and constructed to emit or capture such pollutant, or that any requirement for, or use of, such a conveyance would be inconsistent with any Federal, State or local law'' or ''the application of measurement methodology to a particular class of sources is not practicable due to technological and economic limitations.''

We have concluded that, during periods of cupola off blast, which includes startup, shutdown, and idling, it is not feasible to prescribe or enforce the numeric limits of the emission standard for VOHAP and that standards may be appropriately established under CAA section 112(h). The cupola furnace is essentially an open column during the initial cupola startup steps and during the final cupola shutdown steps, and the emissions are not emitted through a conveyance. Further, the initial procedures to prepare the cupola bed or remove the cupola from service cannot be safely completed with the cupola VOHAP control system operating. After further evaluation, we have determined the appropriate requirements for these steps (specifically refractory curing, cupola bed preparation, and the initial phases of cupola coke bed preparation during cupola startup and the final cooling stages and cupola banking or bottom drop during cupola shutdown) are the general duty requirements in 40 CFR 63.7710(a) to operate according to procedures to minimize emissions as contained in the O&M plan and to comply with the opacity limit at 40 CFR 63.7690(a)(7). We are adding definitions of ''cupola startup'' and ''cupola shutdown'' to describe the various steps for cupola startup and cupola shutdown to clarify when the work practice standards apply. For other startup and shutdown procedures, the cupola tuyere covers are closed, and the capture and control system can be operated. We modified the definition of ''off blast'' to clearly specify that off blast includes shutdown procedures as well as startup procedures. Even though the capture system can be operated during portions of off blast periods, we determined that the application of reliable emissions measurement methodologies to this source during these off blast periods is not practicable due to technological limitations. First, the flow rates during periods of off blast are typically low and highly variable. Additionally, the off blast periods are short duration (*e.g.,* less than 3 hours), and the required duration of a performance test to evaluate compliance with the VOHAP emission limit is 3 hours. As such, we determined that work practice standards

are appropriate for VOHAP during off blast periods. We are requiring that owners/operators (1) begin operating the cupola afterburner or other thermal combustion device as soon as practicable after beginning the coke bed preparatory step but no later than 30 minutes after the blast air is started to begin the coke bed burn-in and (2) operate the afterburner or other thermal combustion device with a flame present at all times during other off blast periods. Maintaining the operation of the afterburner during off blast periods will ensure VOHAP emissions that come from the process are combusted. Based on our understanding of the current operations of these furnaces and practices applied in the industry, we believe these requirements reflect the procedures of the best performing sources.

With respect to the compliance dates related to SSM changes, we proposed that the proposed revisions would become effective immediately because we expected that facilities could comply immediately with the standards at all times and that no or limited revisions in procedures would be needed. Because we are finalizing specific work-practice standards that apply to VOHAP emissions during cupola startup and shutdown for major source iron and steel foundries, we expect that some facilities will need to revise their startup procedures and revise their O&M plans to comply with the new work practice standards. Consequently, as suggested by the commenter, we are providing 180 days for major source facilities to transition from their existing SSM plans to compliance with the emission limitations, including the new work practice standards, at all times. We consider 180 days to be the minimum time needed to complete the management of these changes, which includes evaluating the changes, forming a team to accomplish the changes, conducting safety assessments, updating associated plans and procedures, and providing training to implement the changes. We consider a period of 180 days to be the most expeditious compliance period practicable, and, thus, we are finalizing the requirement that existing affected sources be in compliance with all of the revised requirements in the major source NESHAP within 180 days of the effective date of this final rule. We are revising 40 CFR 63.7720(a) and (c), which require preparation and operation according to an SSM plan, to provide a 180-day compliance period with these specific SSM provisions in the major source NESHAP as foundry owners or operators transition to the new work practice standards for cupola VOHAP emissions. Additional time is not required for the areas source NESHAP SSM revisions that were proposed or other major source NESHAP SSM revisions (not referenced above) that were proposed because operational changes are not needed to implement these other revisions, which are primarily revisions to the General Provisions applicability tables. As such, we are finalizing that those requirements become effective upon the date of promulgation as proposed.

4. What is the rationale for our final approach for the SSM provisions?

We evaluated all comments on the EPA's proposed amendments to remove the SSM provisions. For the reasons explained in the proposed rule, we determined that the proposed removal of the SSM exemptions is required to be consistent with the 2008 Court decision that standards apply at all times. For the area source NESHAP, we are finalizing our approach for removing the SSM exemptions as proposed. For the major source NESHAP, we are finalizing our approach for removing the SSM exemptions as proposed, except for provisions related to cupola furnace VOHAP emission limits. More information concerning the non-cupola amendments that we are finalizing for SSM is in the preamble to the proposed rule (84 FR 54415–54419, October 9, 2019). For cupola furnaces at major source iron and steel foundries, as described above in section IV.C.3 of this preamble, we determined that work practice standards during startup and shutdown are appropriate for the VOHAP standards under the provision of CAA section 112(h). We added monitoring and recordkeeping requirements for foundry owners or operators to demonstrate compliance with the new work practice standards. The temperature monitoring requirement is the same as needed to demonstrate compliance during normal ''on blast'' conditions, so we expect the monitoring requirement will not increase burden appreciably. The recordkeeping requirements are new and specific to documenting relevant times of off blast so facilities can demonstrate compliance with the new work practice standards. Semiannual reporting of deviations is required in the major source NESAHP, so reporting of deviations from the new work practice standards is also required. We determined that these additional requirements were the minimum necessary to demonstrate compliance with the new work practice standards for VOHAP from cupola furnaces during periods of off blast.

For the reasons detailed in section IV.C.3 of this preamble, we are finalizing these new work practice standards in the major source NESHAP during cupola startup and shutdown and providing 180 days to comply with these new requirements. During this 180-day transition period, major source foundry owners or operators must operate according to their SSM plan and we are retaining these specific SSM provisions in the major source NESHAP at 40 CFR 63.7720(a) and (c) for the 180-day transition period. We determined 180 days to be the most expeditious compliance period practicable to implement operational changes. For affected sources that commence construction or reconstruction after the effective date of these amendments, they must be in compliance with all emission limitations, including the new work practice standards, upon startup because additional time is not needed for these sources.

D. Electronic Reporting

1. What did we propose?

We proposed amendments to the major and area source Iron and Steel Foundries NESHAP to require foundry owners or operators to submit electronic copies of initial notifications, notifications of compliance status, performance test reports, performance evaluation reports, and semiannual reports through the EPA's Central Data Exchange (CDX) using CEDRI. Additionally, we proposed two broad circumstances in which electronic reporting extensions may be provided at the discretion of the Administrator. The EPA proposed these extensions to protect owners or operators from noncompliance in cases where they are unable to successfully submit a report by the reporting deadline for reasons outside of their control, including CDX and CEDRI outages and *force majeure* events, such as acts of nature, war, or terrorism.

2. What changed since proposal?

We determined that no changes were necessary to the proposed requirements for foundry owners or operators to submit initial notifications, notifications of compliance status, performance test reports, performance evaluation reports, and semiannual reports electronically using CEDRI. Therefore, we are finalizing the electronic reporting provisions as proposed (84 FR 54419, October 9, 2019).

3. What are the key comments and what are our responses?

Comment: The EPA received one comment generally supporting the proposed amendment to require electronic reporting but asserting that the *force majeure* language should be removed. The commenter expressed concern that the *force majeure* provisions violate the requirement for standards to be continuous and that they would allow unreported exceedances to go unchecked indefinitely.

Response: Regarding the *force majeure* provisions, we disagree that the ability to request a reporting extension would create a mechanism that owners or operators could use to evade binding emissions standards or provide a mechanism where those emission standards do not apply at all times. Also, we note that there is no exception or exemption to reporting, only a method for requesting an extension of the reporting deadline. There is no predetermined timeframe for the length of extension that can be granted, as this is something best determined by the Administrator when reviewing the circumstances surrounding the request. Different circumstances may require a different length of extension for electronic reporting. For example, a tropical storm may delay electronic reporting for a day, but a category 5 hurricane event may delay electronic reporting much longer, especially if the facility has no power, and, as such, the owner or operator has no ability to access electronically stored data or to submit reports electronically. The Administrator will be the most knowledgeable on the events leading to the request for extension and will assess whether an extension is appropriate and, if so, determine a reasonable length. The Administrator may even request that the report be sent in hard copy until electronic reporting can be resumed. While no new fixed duration deadline is set, the regulation does require that the report be submitted electronically as soon as possible after the CEDRI outage is resolved or after the *force majeure* event occurs.

Comment: One commenter stated that electronic reporting through CEDRI should not be required for states delegated to administer/enforce the NESHAP, unless electronic reporting is specifically required by the state.

Response: Regarding having delegated states determine whether electronic reporting is required, we note that the delegation of authority to states does not relieve facilities of their obligation to report to the EPA per 40 CFR 63.13(a), which requires all requests, reports, applications, submittals, and other communications shall be submitted to the appropriate Regional office of the EPA. In the case of the electronic reporting, those obligations are met through the submission to CEDRI. We are retaining the requirement to report through CEDRI for all reporters, as proposed. To clarify that electronic submission when required by regulation meets the requirement of 40 CFR 63.13(a), Table 1 of subpart EEEEE and Table 3 of ZZZZZ have been amended to specify in the explanation column that ''Except: reports and notifications required to be submitted to CEDRI meet this obligation through electronic reporting.''

4. What is the rationale for our final approach to electronic reporting?

We are finalizing as proposed a requirement in both the area source NESHAP and major source NESHAP that owners or operators of iron and steel foundries submit electronic copies of notifications, performance evaluation reports, and semiannual compliance reports using CEDRI. We also are finalizing, as proposed, provisions that allow facility owners or operators a process to request extensions for submitting electronic reports for circumstances beyond the control of the facility (*i.e.,* for a possible outage in the CDX or CEDRI or for a *force majeure* event). Based on public comments received, we are finalizing an additional revision to the General Provision tables (Table 1 to subpart EEEEE and Table 3 to subpart ZZZZZ) to add a specific entry for 40 CFR 63.13(a), and clarifying in the explanation column that electronic submissions to CEDRI meet the reporting requirement at 40 CFR 63.13(a). These amendments will increase the ease and efficiency of data submittal for owners and operators of iron and steel foundries and will make the data more accessible to regulators and the public.

E. Technical and Editorial Corrections

1. What did we propose?

We proposed one editorial correction for 40 CFR part 63, subpart EEEEE, to revise 40 CFR 63.7732(e)(1) to correct the reference to ''paragraphs (b)(1)(i) through (v)'' to be ''paragraphs (e)(1)(i) through (v).''

We proposed several technical and editorial corrections for 40 CFR part 63, subpart ZZZZZ as follows.

- To match requirements in 40 CFR part 63, subpart EEEEE, revise 40 CFR 63.10885(a)(1) to add the sentence: ''Any post-consumer engine blocks, post-consumer oil filters, or oily turnings that are processed and/or cleaned to the extent practicable such that the materials do not include lead components, mercury switches, chlorinated plastics, or free organic liquids can be included in this certification.''
- Revise 40 CFR 63.10890(c) to correct the reference to ''§ 63.9(h)(1)(i)'' to be ''§ 63.9(h)(2)(i).''
- Revise 40 CFR 63.10890(f) to correct the reference to ''§ 63.10(e)'' to be ''§ 63.13.''
- Revise 40 CFR 63.10897(d)(3) and (g) to replace all instances of ''correction action'' with ''corrective action'' to correct typographical errors.
- Revise 40 CFR 63.10899(c) to correct the reference to ''§ 63.10(e)'' to be ''§ 63.13.''
- To match requirements in 40 CFR part 63, subpart EEEEE, revise the entry for 40 CFR 63.9 in Table 3 to subpart ZZZZZ to add an explanation in column 4 to read ''Except for opacity performance tests.''

2. What changed since proposal?

We determined that no changes were necessary to the proposed technical and editorial corrections outlined above. Therefore, we are finalizing these technical and editorial corrections with no changes (84 FR 54420, October 9, 2019). We did receive notification of a typographical error in 40 CFR 63.10897(d)(1)(i) of subpart ZZZZZ, which specifies detection limits for bag leak detectors. The detectors must be capable of detecting emissions of PM at concentrations of 10 milligrams per actual cubic meter. This requirement includes a parenthetical providing the limit in units of grains per actual cubic feet. Unfortunately, in the area source rule, the limit in units of grains per actual cubic feet included a typographical error, listing it as 0.00044 rather than 0.0044 grains per actual cubic feet. The correct unit conversion for 10 milligrams per actual cubic meter is 0.0044 grains per actual cubic feet. The correct value is included in the major source rule at 40 CFR 63.7741(b)(1). Based on the identification of this additional typographical error, we are finalizing revision of 40 CFR 63.10897(d)(1)(i) to revise the parenthetical from ''(0.00044 grains per actual cubic foot)'' to ''(0.0044 grains per actual cubic foot).''

3. What are the key comments and what are our responses?

The EPA did not receive any comments on the proposed technical and editorial corrections.

4. What is the rationale for our final approach to technical and editorial corrections?

We identified necessary technical and editorial corrections and received no comments except for the identification of a typographical error (discussed above) at 40 CFR 63.10897(d)(1)(i) in subpart ZZZZZ. Therefore, we are finalizing the revisions, including correction of the typographical error in order to correct and clarify the requirements in the rules.

V. Summary of Cost, Environmental, and Economic Impacts and Additional Analyses Conducted

A. What are the affected sources?

There are approximately 45 major source iron and steel foundries subject to 40 CFR part 63, subpart EEEEE, and approximately 390 area source iron and steel foundries subject to 40 CFR part 63, subpart ZZZZZ.

B. What are the air quality impacts?

Because we are not revising the emission limitations for iron and steel foundries other than the new work practice standards for VOHAP for major sources during startup and shutdown for cupola melting furnaces, we do not anticipate any quantifiable air quality impacts as a result of the final amendments. However, since the final amendments include the removal of the SSM exemptions for both major and area sources and the addition of new work practice standards for cupola startup and shutdown for major sources, this final rule may reduce emissions by an unquantified amount by ensuring proper operation of control devices and other measures during SSM periods.

C. What are the cost impacts?

We expect that the final amendments will have minimal cost impacts for iron and steel foundries. The final editorial corrections will have no cost impacts. The final revisions to use electronic reporting effectively replace existing requirements to mail in copies of the required reports and notifications. We expect that the electronic system will save some time and expense compared to printing and mailing the required reports and notifications; however, it will take some time for foundry owners or operators to review the new electronic notification and reporting form, review their recordkeeping processes, and potentially revise their processes to more efficiently complete their semiannual reports. There may also be initial costs associated with electronic reporting of performance tests. We are also finalizing revisions to SSM provisions. Again, these revisions are expected to have minimal impact on affected iron and steel foundries. For major source iron and steel foundries, we are eliminating the need to develop a SSM plan or submit an immediate SSM report when the SSM plan is not followed and there is an exceedance of an applicable emission limitation. While this may reduce some burden, iron and steel foundry owners or operators will still need to assess their operations and make plans to achieve the emission limitations at all times, including periods of startup, shutdown, or malfunction. Additionally, we are adding new recordkeeping requirements for major source foundries related to cupola off blast periods, which includes cupola startup, shutdown, and idling periods to demonstrate compliance with the new work practice standards.

For the 45 major source iron and steel foundries subject to 40 CFR part 63, subpart EEEEE, we estimate the first-year costs associated with the final electronic reporting and SSM revisions will be $107,000 or approximately $2,380 per major source foundry. This includes one-time costs to learn the electronic reporting templates and set up recordkeeping systems to work with the electronic reporting, one-time costs for facilities that conducted a source test to learn the electronic reporting system for submitting performance tests, and costs associated with the new recordkeeping requirements for the work practice standards to reduce cupola VOHAP emissions while off blast. As performance tests are required every 5 years, we expect facilities will continue to incur additional costs for reporting performance test results, since facilities reporting performance test results in Year 2, 3, 4, or 5 would be using that system for the first time. For Years 2 and on, owners or operators of major source foundries will incur annual costs associated with recordkeeping requirements for the work practice standards to reduce cupola VOHAP emissions while off blast, but they will also realize some cost savings for semiannual reporting due to efficiencies achieved once they adapt to the new electronic reporting system. We estimate the nationwide annual costs for Years 2 through 5 would be approximately $32,500 per year or $720 per year per major source foundry.

For the 390 area source foundries subject to 40 CFR part 63, subpart ZZZZZ, we estimate the total first year costs associated with the final electronic reporting and SSM revisions will be $352,000 or approximately $900 per area source foundry. This includes one-time costs to learn the electronic reporting templates and set up recordkeeping systems to work with the electronic reporting and, for large area source foundries only, one-time costs to learn the electronic reporting system for submitting performance tests for those facilities that conducted a performance test. Because performance tests are required every 5 years, we expect a portion of the large area source foundries will continue to incur additional costs for reporting performance test results, since facilities reporting performance test results in Year 2, 3, 4, or 5 would be using that system for the first time. For Years 2 and on, all area source foundries will also realize some cost savings for semiannual reporting due to efficiencies achieved once facilities adapt to the new electronic reporting system. We estimate that all area source will realize a net cost savings for Years 2 and on and that the cumulative saving across all area source foundries would be $67,400 per year or a savings of $170 per year per area source foundry.

D. What are the economic impacts?

Economic impact analyses focus on changes in market prices and output levels. If changes in market prices and output levels in the primary markets are significant enough, impacts on other markets may also be examined. Both the magnitude of costs needed to comply with a final rule and the distribution of these costs among affected facilities can have a role in determining how the market will change in response to a final rule. Because the costs associated with the final revisions are minimal, no significant economic impacts are anticipated as a result of the final amendments.

E. What are the benefits?

The final amendments will result in improvements to the rule. Specifically, the final amendments revise the standards to reflect that they apply at all times. Additionally, the final amendments requiring electronic submittal of initial notifications, performance test results, and semiannual reports will increase the usefulness of the data, are in keeping with current trends of data availability, will further assist in the protection of public health and the environment, and will ultimately result in less burden on the regulated community. The final technical and editorial corrections improve the clarity of the rule.

F. What analysis of environmental justice did we conduct?

Executive Order 12898 (59 FR 7629, February 16, 1994) establishes Federal executive policy on environmental justice. Its main provision directs Federal agencies, to the greatest extent practicable and permitted by law, to make environmental justice part of their mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority populations and low-income populations in the United States.

To examine the potential for any environmental justice issues that might be associated with the source category, we performed a demographic analysis, which is an assessment of risks to individual demographic groups of the populations living within 5 kilometers (km) and within 50 km of the facilities. In the analysis, we evaluated the distribution of HAP-related cancer and noncancer risks from the major source Iron and Steel Foundries source category across different demographic groups within the populations living near facilities.[15]

The results of the major source Iron and Steel Foundries source category demographic analysis indicate that emissions from the source category expose approximately 144,000 people to a cancer risk at or above 1-in-1 million and zero people to a chronic noncancer hazard index greater than or equal to 1. The African American population exposed to a cancer risk at or above 1-in-1 million due to iron and steel foundries emissions is 4 percent above the national average. Likewise, populations living ''Below Poverty Level'' and ''Over 25 and without High School Diploma'' are exposed to cancer risk above 1-in-1 million, 6 and 4 percent above the national average, respectively. The percentages of the at-risk population in other demographic groups are similar to or lower than their respective nationwide percentages. The methodology and the results of the demographic analysis are presented in a technical report, *Risk and Technology Review—Analysis of Demographic Factors for Populations Living Near Iron and Steel Foundries,* available as Docket Item No. EPA–HQ–OAR–2019–0373–0020.

[15] Demographic groups included in the analysis are: White, African American, Native American, other races and multiracial, Hispanic or Latino, children 17 years of age and under, adults 18 to 64 years of age, adults 65 years of age and over, adults without a high school diploma, people living below the poverty level, people living 2 times the poverty level, and linguistically isolated people.

G. What analysis of children's environmental health did we conduct?

The EPA does not believe the environmental health or safety risks addressed by this action present a disproportionate risk to children. The health risk assessments for this action are contained the document titled *Residual Risk Assessment for the Iron and Steel Foundries Major Source Category in Support of the 2020 Risk and Technology Review Final Rule,* available in the docket (Docket ID No. EPA–HQ–OAR–2019–0373).

VI. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at *https://www.epa.gov/laws-regulations/laws-and-executive-orders.*

A. Executive Orders 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is not a significant regulatory action and was, therefore, not submitted to the Office of Management and Budget (OMB) for review.

B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs

This action is not an Executive Order 13771 regulatory action because this action is not significant under Executive Order 12866.

C. Paperwork Reduction Act (PRA)

The information collection activities in this final rule have been submitted for approval to OMB under the PRA.

1. Iron and Steel Foundries Major Sources

The information collection request (ICR) document that the EPA prepared has been assigned EPA ICR number 2096.09. You can find a copy of the ICR in the docket for this rule, and it is briefly summarized here. The information collection requirements are not enforceable until OMB approves them.

We are finalizing amendments that require electronic reporting, remove the malfunction exemption, and impose other revisions that affect reporting and recordkeeping for iron and steel foundries major source facilities. This information will be collected to assure compliance with 40 CFR part 63, subpart EEEEE.

Respondents/affected entities: Owners or operators of iron and steel foundries major source facilities.

Respondent's obligation to respond: Mandatory (40 CFR part 63, subpart EEEEE).

Estimated number of respondents: 45 (total).

Frequency of response: Initial, semiannual, and annual.

Total estimated burden: The annual recordkeeping and reporting burden for facilities to comply with all of the requirements in the NESHAP is estimated to be 15,400 hours (per year). Burden is defined at 5 CFR 1320.3(b).

Total estimated cost: The annual recordkeeping and reporting burden for facilities to comply with all of the requirements in the NESHAP is estimated to be $1,440,000 (per year), which includes $206,000 annualized capital or O&M costs.

2. Iron and Steel Foundries Area Sources

The ICR document that the EPA prepared has been assigned EPA ICR number 2267.07. You can find a copy of the ICR in the docket for this rule, and it is briefly summarized here. The information collection requirements are not enforceable until OMB approves them.

We are finalizing amendments that require electronic reporting, remove the malfunction exemption, and impose other revisions that affect reporting and recordkeeping for iron and steel foundries area source facilities. This information will be collected to assure compliance with 40 CFR part 63, subpart ZZZZZ.

Respondents/affected entities: Owners or operators of iron and steel foundries area source facilities.

Respondent's obligation to respond: Mandatory (40 CFR part 63, subpart ZZZZZ).

Estimated number of respondents: 390 (total), 75 of these are classified as large iron and steel foundries and 315 are classified as small iron and steel foundries.

Frequency of response: Initial, semiannual, and annual.

Total estimated burden: The annual recordkeeping and reporting burden for facilities to comply with all of the requirements in the NESHAP is estimated to be 14,400 hours (per year). Burden is defined at 5 CFR 1320.3(b).

Total estimated cost: The annual recordkeeping and reporting burden for facilities to comply with all of the requirements in the NESHAP is estimated to be $1,150,000 (per year); there are no annualized capital or O&M costs.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information

unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations in 40 CFR are listed in 40 CFR part 9. When OMB approves this ICR, the Agency will announce that approval in the **Federal Register** and publish a technical amendment to 40 CFR part 9 to display the OMB control number for the approved information collection activities contained in this final rule.

D. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. In making this determination, the impact of concern is any significant adverse economic impact on small entities. An agency may certify that a rule will not have a significant economic impact on a substantial number of small entities if the rule relieves regulatory burden, has no net burden or otherwise has a positive economic effect on the small entities subject to the rule. The final amendments have a very limited one-time burden as affected facilities implement electronic reporting for the first time, but affected facilities will see a net cost savings in subsequent years that will off-set the initial one-time costs within the first 3 years after implementation. We have, therefore, concluded that this action will have no net regulatory burden for all directly regulated small entities.

E. Unfunded Mandates Reform Act (UMRA)

This action does not contain an unfunded mandate of $100 million or more as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. While this action creates an enforceable duty on the private sector, the cost does not exceed $100 million or more.

F. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the National Government and the states, or on the distribution of power and responsibilities among the various levels of government.

G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications as specified in Executive Order 13175. It will not have substantial direct effects on tribal governments, on the relationship between the Federal Government and Indian Tribes, or on the distribution of power and responsibilities between the Federal Government and Indian Tribes. No tribal governments own facilities subject to the NESHAP. Thus, Executive Order 13175 does not apply to this action.

H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

This action is not subject to Executive Order 13045 because it is not economically significant as defined in Executive Order 12866, and because the EPA does not believe the environmental health or safety risks addressed by this action present a disproportionate risk to children. This action's health and risk assessments are contained in sections III.A and IV.A of this preamble. Further documentation is provided in the following risk report titled *Residual Risk Assessment for the Iron and Steel Foundries Major Source Category in Support of the 2020 Risk and Technology Review Final Rule,* which can be found in the docket for this action.

I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This action is not subject to Executive Order 13211 because it is not a significant regulatory action under Executive Order 12866.

J. National Technology Transfer and Advancement Act (NTTAA)

This rulemaking does not involve technical standards.

K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes that this action does not have disproportionately high and adverse human health or environmental effects on minority populations, low income populations, and/or indigenous peoples, as specified in Executive Order 12898 (59 FR 7629, February 16, 1994). The documentation for this decision is contained in the technical report titled *Risk and Technology Review—Analysis of Demographic Factors for Populations Living Near Iron and Steel Foundries,* available as Docket Item No. EPA–HQ–OAR–2019–0373–0020.

L. Congressional Review Act (CRA)

This action is subject to the CRA, and the EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action is not a ''major rule'' as defined by 5 U.S.C. 804(2).

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedures, Air pollution control, Hazardous substances, Incorporation by reference, Intergovernmental relations, Reporting and recordkeeping requirements.

Andrew Wheeler,

Administrator.

For the reasons set forth in the preamble, the EPA is amending 40 CFR part 63 as follows:

PART 63—NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart EEEEE—National Emission Standards for Hazardous Air Pollutants for Iron and Steel Foundries

■ 2. Section 63.7690 is amended by revising paragraph (a)(8) to read as follows:

§ 63.7690 What emissions limitations must I meet?

(a) * * *

(8) For each cupola metal melting furnace at a new or existing iron and steel foundry, you must not discharge emissions of volatile organic hazardous air pollutants (VOHAP) through a conveyance to the atmosphere that exceed 20 parts per million by volume (ppmv) corrected to 10-percent oxygen while on blast.

* * * * *

■ 3. Section 63.7700 is amended by adding paragraph (g) to read as follows:

§ 63.7700 What work practice standards must I meet?

* * * * *

(g) For each cupola at a new or existing iron and steel foundry, you must reduce VOHAP emissions to the extent practicable during periods of off blast, as defined in § 63.7765, by meeting the applicable requirements in paragraph (g)(1) or (2) of this section.

(1) On and before March 9, 2021, you must comply with the requirements in § 63.7710 and the requirements specified in the startup, shutdown, and malfunction plan required at § 63.7720(c).

(2) After March 9, 2021, you must comply with the applicable requirements in paragraphs (g)(2)(i) through (iii) of this section.

(i) Except as provided in paragraphs (g)(2)(ii) and (iii) of this section, you

must operate an afterburner or other thermal combustion control device with a flame present at all times while the cupola is off blast. This includes the latter portion of coke bed preparation step and the initial metallics charging step during cupola startup, the slag and residual metal removal step during cupola shutdown, and idling conditions when the blast air is turned off or down to the point that the cupola does not produce additional molten metal.

(ii) During cupola startup steps of refractory curing and cupola bed preparation and during the cupola shutdown steps of cupola cooling and banking or bottom drop, you must comply with the requirements in § 63.7710 and the opacity limit in § 63.7690(a)(7).

(iii) You must light the cupola afterburner or other thermal combustion control device as soon as practicable during the cupola startup step of coke bed preparation following the procedures included in the operation and maintenance plan required at § 63.7710(b), but no later than 30 minutes after the blast air is started to begin the coke bed burn-in.

■ 4. Section 63.7710 is amended by revising paragraphs (a) and (b) introductory text to read as follows:

§ 63.7710 What are my operation and maintenance requirements?

(a) You must always operate and maintain your iron and steel foundry, including air pollution control and monitoring equipment, in a manner consistent with good air pollution control practices for minimizing emissions at least to the levels required by this subpart.

(b) You must prepare and operate at all times according to a written operation and maintenance plan for each capture and collection system and control device for an emissions source subject to a PM, metal HAP, TEA, or VOHAP emissions limit in § 63.7690(a) or the work practice standards in § 63.7700(g). Your operation and maintenance plan also must include procedures for igniting gases from mold vents in pouring areas and pouring stations that use a sand mold system. This operation and maintenance plan is subject to approval by the Administrator. Each plan must contain the elements described in paragraphs (b)(1) through (6) of this section.

* * * * *

■ 5. Section 63.7720 is amended by revising paragraphs (a) and (c) to read as follows:

§ 63.7720 What are my general requirements for complying with this subpart?

(a) On and before March 9, 2021, for affected sources that commenced construction or reconstruction on or before September 10, 2020, you must be in compliance with the emissions limitations, work practice standards, and operation and maintenance requirements in this subpart at all times, except during periods of startup and shutdown. After March 9, 2021, for affected sources that commenced construction or reconstruction on or before September 10, 2020, and upon startup for affected sources that commenced construction or reconstruction after September 10, 2020, you must be in compliance with the emissions limitations, work practice standards, and operation and maintenance requirements in this subpart at all times.

* * * * *

(c) On and before March 9, 2021, for affected sources that commenced construction or reconstruction on or before March 9, 2021, you must develop a written startup, shutdown, and malfunction plan according to the provisions in § 63.6(e)(3). The startup, shutdown, and malfunction plan also must specify what constitutes a shutdown of a cupola and how to determine that operating conditions are normal following startup of a cupola. After March 9, 2021, for affected sources that commenced construction or reconstruction on or before September 10, 2020, and upon startup for affected sources that commenced construction or reconstruction after September 10, 2020, the startup, shutdown, and malfunction plan requirements no longer apply.

■ 6. Section 63.7732 is amended by revising paragraphs (a) and (e)(1) introductory text to read as follows:

§ 63.7732 What test methods and other procedures must I use to demonstrate initial compliance with the emissions limitations?

(a) You must conduct each performance test that applies to your iron and steel foundry based on your selected compliance alternative, if applicable, according to the requirements in paragraphs (b) through (i) of this section. Each performance test must be conducted under conditions representative of normal operations. Normal operating conditions exclude periods of startup and shutdown. You may not conduct performance tests during periods of malfunction. You must record the process information that is necessary to document operating conditions during the test and include in such record an explanation to support that such conditions represent normal operation. Upon request, you shall make available to the Administrator such records as may be necessary to determine the conditions of performance tests.

* * * * *

(e) * * *

(1) Determine the VOHAP concentration for each test run according to the test methods in 40 CFR part 60, appendix A, that are specified in paragraphs (e)(1)(i) through (v) of this section.

* * * * *

■ 7. Section 63.7740 is amended by revising paragraph (e) to read as follows:

§ 63.7740 What are my monitoring requirements?

* * * * *

(e) For each combustion device subject to the operating limit in § 63.7690(b)(3) or the work practice standard in § 63.7700(g)(2)(i), you must at all times monitor the 15-minute average combustion zone temperature using a CPMS according to the requirements of § 63.7741(d).

* * * * *

■ 8. Section 63.7741 is amended by revising paragraph (d) introductory text to read as follows:

§ 63.7741 What are the installation, operation, and maintenance requirements for my monitors?

* * * * *

(d) For each combustion device subject to the operating limit in § 63.7690(b)(3) or (4) or the work practice standard in § 63.7700(g)(2)(i), you must install and maintain a CPMS to measure and record the combustion zone temperature according to the requirements in paragraphs (d)(1) through (8) of this section.

* * * * *

■ 9. Section 63.7744 is amended by adding paragraph (e) to read as follows:

§ 63.7744 How do I demonstrate continuous compliance with the work practice standards that apply to me?

* * * * *

(e) For each cupola furnace at a new or existing iron and steel foundry in off blast, you must keep daily records to document the relevant times of off blast, in conjunction with the requirements to monitor and record the combustion zone temperature for the cupola's thermal combustion control device as required in §§ 63.7740(e) and 63.7741(d), to demonstrate continuous compliance with the requirements in § 63.7700(g). The relevant times of off

blast include: The time blast air is started to begin the coke bed burn-in, the time the cupola afterburner or other thermal combustion device is lit, and the time metal production starts during cupola startup; the time when metal production ends, the time slag removal is completed, and the time the afterburner or other thermal combustion device is turned off during cupola shutdown; and the times idling starts and stops.

§ 63.7746 [Amended]

■ 10. Section 63.7746 is amended by removing and reserving paragraph (b).

■ 11. Section 63.7751 is amended by:

■ a. In paragraph (a) introductory text, removing ''Compliance report due dates'' and adding ''*Compliance report due dates*'' in its place;

■ b. In paragraph (b) introductory text, removing ''Compliance report contents'' and adding ''*Compliance report contents*'' in its place;

■ c. Removing and reserving paragraph (b)(4);

■ d. Revising paragraphs (b)(6) through (8);

■ e. Removing and reserving paragraph (c);

■ f. In paragraph (d), removing ''Part 70 monitoring report'' and adding ''*Part 70 monitoring report*'' in its place; and

■ g. Adding paragraphs (e) through (i).

The revisions and additions read as follows:

§ 63.7751 What reports must I submit and when?

* * * * *

(b) * * *

(6) If there were no periods during which a continuous monitoring system (including a CPMS or CEMS) was inoperable or out-of-control as specified by § 63.8(c)(7), a statement that there were no periods during which the CPMS was inoperable or out-of-control during the reporting period.

(7) For each affected source or equipment for which there was a deviation from an emissions limitation (including an operating limit, work practice standard, or operation and maintenance requirement) that occurs at an iron and steel foundry during the reporting period, the compliance report must contain the information specified in paragraphs (b)(7)(i) through (iii) of this section. The requirement in this paragraph (b)(7) includes periods of startup, shutdown, and malfunction.

(i) A list of the affected source or equipment and the total operating time of each emissions source during the reporting period.

(ii) For each deviation from an emissions limitation (including an operating limit, work practice standard, or operation and maintenance requirement) that occurs at an iron and steel foundry during the reporting period, report:

(A) The date, start time, duration (in hours), and cause of each deviation (characterized as either startup, shutdown, control equipment problem, process problem, other known cause, or unknown cause, as applicable) and the corrective action taken; and

(B) An estimate of the quantity of each regulated pollutant emitted over any emission limit and a description of the method used to estimate the emissions.

(iii) A summary of the total duration (in hours) of the deviations that occurred during the reporting period by cause (characterized as startup, shutdown, control equipment problems, process problems, other known causes, and unknown causes) and the cumulative duration of deviations during the reporting period across all causes both in hours and as a percent of the total source operating time during the reporting period.

(8) For each continuous monitoring system (including a CPMS or CEMS) used to comply with the emissions limitation or work practice standard in this subpart that was inoperable or out-of-control during any portion of the reporting period, you must include the information specified in paragraphs (b)(8)(i) through (vi) of this section. The requirement in this paragraph (b)(8) includes periods of startup, shutdown, and malfunction.

(i) A brief description of the continuous monitoring system, including manufacturer and model number.

(ii) The date of the latest continuous monitoring system certification or audit.

(iii) A brief description and the total operating time of the affected source or equipment that is monitored by the continuous monitoring system during the reporting period.

(iv) A description of any changes in continuous monitoring systems, processes, or controls since the last reporting period.

(v) For each period for which the continuous monitoring system was inoperable or out-of-control during the reporting period, report:

(A) The date, start time, and duration (in hours) of the deviation;

(B) The type of deviation (inoperable or out-of-control); and

(C) The cause of deviation (characterized as monitoring system malfunctions, non-monitoring equipment malfunctions, quality assurance/quality control calibrations, other known causes, and unknown causes, as applicable) and the corrective action taken.

(vi) A summary of the total duration (in hours) of the deviations that occurred during the reporting period by cause (characterized as monitoring system malfunctions, non-monitoring equipment malfunctions, quality assurance/quality control calibrations, other known causes, and unknown causes) and the cumulative duration of deviations during the reporting period across all causes both in hours and as a percent of the total source operating time during the reporting period.

* * * * *

(e) *Compliance report submission requirements.* Prior to March 9, 2021, you must submit semiannual compliance reports to the Administrator as specified in § 63.13. Beginning on March 9, 2021, you must submit all subsequent semiannual compliance reports to the EPA via the Compliance and Emissions Data Reporting Interface (CEDRI), which can be accessed through the EPA's Central Data Exchange (CDX) (*https://cdx.epa.gov/*). The EPA will make all the information submitted through CEDRI available to the public without further notice to you. Do not use CEDRI to submit information you claim as confidential business information (CBI). Anything submitted using CEDRI cannot later be claimed to be CBI. You must use the appropriate electronic report template on the CEDRI website (*https://www.epa.gov/electronic-reporting-air-emissions/cedri*) for this subpart. The date report templates become available will be listed on the CEDRI website. The report must be submitted by the deadline specified in this subpart, regardless of the method in which the report is submitted. If you claim some of the information required to be submitted via CEDRI is CBI, submit a complete report, including information claimed to be CBI, to the EPA. The report must be generated using the appropriate form on the CEDRI website or an alternate electronic file consistent with the extensible markup language (XML) schema listed on the CEDRI website. Although we do not expect persons to assert a claim of CBI, if persons wish to assert a CBI, submit the file on a compact disc, flash drive, or other commonly used electronic storage medium and clearly mark the medium as CBI. Mail the electronic medium to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404–02, 4930 Old Page Rd., Durham, NC 27703. The same file with the CBI omitted must be submitted to the EPA via the EPA's CDX

as described earlier in this paragraph (e). All CBI claims must be asserted at the time of submission. Furthermore, under CAA section 114(c) emissions data is not entitled to confidential treatment and requires EPA to make emissions data available to the public. Thus, emissions data will not be protected as CBI and will be made publicly available.

(f) *Performance test results submission requirements.* Within 60 days after the date of completing each performance test required by this subpart, you must submit the results of the performance test following the procedures specified in paragraphs (f)(1) through (3) of this section.

(1) *Data collected using test methods supported by the EPA's Electronic Reporting Tool (ERT) as listed on the EPA's ERT website (https://www.epa.gov/electronic-reporting-air-emissions/electronic-reporting-tool-ert) at the time of the test.* Submit the results of the performance test to the EPA via the CEDRI, which can be accessed through the EPA's CDX (*https://cdx.epa.gov/*). The data must be submitted in a file format generated through the use of the EPA's ERT. Alternatively, you may submit an electronic file consistent with the XML schema listed on the EPA's ERT website.

(2) *Data collected using test methods that are not supported by the EPA's ERT as listed on the EPA's ERT website at the time of the test.* The results of the performance test must be included as an attachment in the ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT website. Submit the ERT generated package or alternative file to the EPA via CEDRI.

(3) *Confidential business information.* The EPA will make all the information submitted through CEDRI available to the public without further notice to you. Do not use CEDRI to submit information you claim as CBI. Anything submitted using CEDRI cannot later be claimed to be CBI. Although we do not expect persons to assert a claim of CBI, if you claim some of the information submitted under paragraph (f)(1) or (2) of this section is CBI, you must submit a complete file, including information claimed to be CBI, to the EPA. The file must be generated through the use of the EPA's ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT website. Submit the file on a compact disc, flash drive, or other commonly used electronic storage medium and clearly mark the medium as CBI. Mail the electronic medium to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404–02, 4930 Old Page Rd., Durham, NC 27703. The same file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described in paragraph (f)(1) of this section. All CBI claims must be asserted at the time of submission. Furthermore, under CAA section 114(c) emissions data is not entitled to confidential treatment and requires EPA to make emissions data available to the public. Thus, emissions data will not be protected as CBI and will be made publicly available.

(g) *Performance evaluation results submission requirements.* Within 60 days after the date of completing each continuous monitoring system (CMS) performance evaluation (as defined in § 63.2), you must submit the results of the performance evaluation following the procedures specified in paragraphs (g)(1) through (3) of this section.

(1) *Performance evaluations of CMS measuring relative accuracy test audit (RATA) pollutants that are supported by the EPA's ERT as listed on the EPA's ERT website at the time of the evaluation.* Submit the results of the performance evaluation to the EPA via CEDRI, which can be accessed through the EPA's CDX. The data must be submitted in a file format generated through the use of the EPA's ERT. Alternatively, you may submit an electronic file consistent with the XML schema listed on the EPA's ERT website.

(2) *Performance evaluations of CMS measuring RATA pollutants that are not supported by the EPA's ERT as listed on the EPA's ERT website at the time of the evaluation.* The results of the performance evaluation must be included as an attachment in the ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT website. Submit the ERT generated package or alternative file to the EPA via CEDRI.

(3) *Confidential business information.* The EPA will make all the information submitted through CEDRI available to the public without further notice to you. Do not use CEDRI to submit information you claim as CBI. Anything submitted using CEDRI cannot later be claimed to be CBI. Although we do not expect persons to assert a claim of CBI, if you claim some of the information submitted under paragraph (g)(1) or (2) of this section is CBI, you must submit a complete file, including information claimed to be CBI, to the EPA. The file must be generated through the use of the EPA's ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT website. Submit the file on a compact disc, flash drive, or other commonly used electronic storage medium and clearly mark the medium as CBI. Mail the electronic medium to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404–02, 4930 Old Page Rd., Durham, NC 27703. The same file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described in paragraph (g)(1) of this section. All CBI claims must be asserted at the time of submission. Furthermore, under CAA section 114(c) emissions data is not entitled to confidential treatment and requires EPA to make emissions data available to the public. Thus, emissions data will not be protected as CBI and will be made publicly available.

(h) *Claims of EPA system outage.* If you are required to electronically submit a report through CEDRI in the EPA's CDX, you may assert a claim of EPA system outage for failure to timely comply with the reporting requirement. To assert a claim of EPA system outage, you must meet the requirements outlined in paragraphs (h)(1) through (7) of this section.

(1) You must have been or will be precluded from accessing CEDRI and submitting a required report within the time prescribed due to an outage of either the EPA's CEDRI or CDX systems.

(2) The outage must have occurred within the period of time beginning five business days prior to the date that the submission is due.

(3) The outage may be planned or unplanned.

(4) You must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or has caused a delay in reporting.

(5) You must provide to the Administrator a written description identifying:

(i) The date(s) and time(s) when CDX or CEDRI was accessed and the system was unavailable;

(ii) A rationale for attributing the delay in reporting beyond the regulatory deadline to EPA system outage;

(iii) Measures taken or to be taken to minimize the delay in reporting; and

(iv) The date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported.

(6) The decision to accept the claim of EPA system outage and allow an extension to the reporting deadline is solely within the discretion of the Administrator.

(7) In any circumstance, the report must be submitted electronically as

soon as possible after the outage is resolved.

(i) *Claims of force majeure.* If you are required to electronically submit a report through CEDRI in the EPA's CDX, you may assert a claim of force majeure for failure to timely comply with the reporting requirement. To assert a claim of force majeure, you must meet the requirements outlined in paragraphs (i)(1) through (5) of this section.

(1) You may submit a claim if a force majeure event is about to occur, occurs, or has occurred or there are lingering effects from such an event within the period of time beginning five business days prior to the date the submission is due. For the purposes of this section, a force majeure event is defined as an event that will be or has been caused by circumstances beyond the control of the affected facility, its contractors, or any entity controlled by the affected facility that prevents you from complying with the requirement to submit a report electronically within the time period prescribed. Examples of such events are acts of nature (*e.g.,* hurricanes, earthquakes, or floods), acts of war or terrorism, or equipment failure or safety hazard beyond the control of the affected facility (*e.g.,* large scale power outage).

(2) You must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or has caused a delay in reporting.

(3) You must provide to the Administrator:

(i) A written description of the force majeure event;

(ii) A rationale for attributing the delay in reporting beyond the regulatory deadline to the force majeure event;

(iii) Measures taken or to be taken to minimize the delay in reporting; and

(iv) The date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported.

(4) The decision to accept the claim of force majeure and allow an extension to the reporting deadline is solely within the discretion of the Administrator.

(5) In any circumstance, the reporting must occur as soon as possible after the force majeure event occurs.

■ 12. Section 63.7752 is amended by:

■ a. Revising paragraph (a)(2);

■ b. Revising paragraphs (b)(2) and (4); and

■ c. Adding paragraphs (d) and (e).

The revisions and additions read as follows:

§ 63.7752 What records must I keep?

(a) * * *

(2) Records of required maintenance performed on the air pollution control and monitoring equipment as required by § 63.10(b)(2)(iii).

* * * * *

(b) * * *

(2) Records of the site-specific performance evaluation test plan required under § 63.8(d)(2) for the life of the affected source or until the affected source is no longer subject to the provisions of this part, to be made available for inspection, upon request, by the Administrator. If the performance evaluation plan is revised, you shall keep previous (*i.e.,* superseded) versions of the performance evaluation plan on record to be made available for inspection, upon request, by the Administrator, for a period of 5 years after each revision to the plan. The program of corrective action should be included in the plan as required under § 63.8(d)(2)(vi).

* * * * *

(4) Records of the date and time that each deviation started and stopped.

* * * * *

(d) You must keep the following records for each failure to meet an emissions limitation (including operating limit), work practice standard, or operation and maintenance requirement in this subpart.

(1) Date, start time, and duration of each failure.

(2) List of the affected sources or equipment for each failure, an estimate of the quantity of each regulated pollutant emitted over any emission limit and a description of the method used to estimate the emissions.

(3) Actions taken to minimize emissions in accordance with § 63.7710(a), and any corrective actions taken to return the affected unit to its normal or usual manner of operation.

(e) Any records required to be maintained by this part that are submitted electronically via the EPA's CEDRI may be maintained in electronic format. This ability to maintain electronic copies does not affect the requirement for facilities to make records, data, and reports available upon request to a delegated air agency or the EPA as part of an on-site compliance evaluation.

■ 13. Section 63.7761 is amended by revising paragraph (c) introductory text and adding paragraph (c)(5) to read as follows:

§ 63.7761 Who implements and enforces this subpart?

* * * * *

(c) The authorities that cannot be delegated to state, local, or tribal agencies are specified in paragraphs (c)(1) through (5) of this section.

* * * * *

(5) Approval of an alternative to any electronic reporting to the EPA required by this subpart.

■ 14. Section 63.7765 is amended by adding in alphabetical order the definitions for ''Cupola shutdown'' and ''Cupola startup'' and revising the definitions for ''Deviation'' (including the undesignated paragraph following the definition) and ''Off blast'' to read as follows:

§ 63.7765 What definitions apply to this subpart?

* * * * *

Cupola shutdown means the period beginning when the last of the molten metal is tapped from the cupola's primary tap hole and ending when the cupola is cooled and the cupola is either banked or the bottom contents are removed (''bottom drop''). *Cupola shutdown* includes the following steps: slag and residual metal removal from secondary tap; cupola cooling; and cupola banking or bottom drop.

Cupola startup means the commencement of activities needed to take a banked cupola or a cupola that has had the bottom dropped back into melt production. *Cupola startup* includes the following steps: refractory curing, if needed; cupola bed preparation (during which the sand bed is preheated), if needed; coke bed preparation (during which coke is added to the cupola and lit); and initial metallics charging.

Deviation means any instance in which an affected source or an owner or operator of such an affected source:

(1) Fails to meet any requirement or obligation established by this subpart including, but not limited to, any emissions limitation (including operating limits), work practice standard, or operation and maintenance requirement; or

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart and that is included in the operating permit for any iron and steel foundry required to obtain such a permit.

(3) A deviation is not always a violation. The determination of whether a deviation constitutes a violation of the standard is up to the discretion of the entity responsible for enforcement of the standards.

* * * * *

Off blast means those periods of cupola operation when the cupola is not actively being used to produce molten metal. *Off blast* conditions include

cupola startup and cupola shutdown. *Off blast* conditions also include idling conditions when the blast air is turned off or down to the point that the cupola does not produce additional molten metal.

* * * * *

■ 15. Table 1 to subpart EEEEE of part 63 is revised to read as follows:

TABLE 1 TO SUBPART EEEEE OF PART 63—APPLICABILITY OF GENERAL PROVISIONS TO THIS SUBPART

[As stated in § 63.7760, you must meet each requirement in the following table that applies to you]

Citation	Subject	Applies to this subpart?	Explanation
63.1	Applicability	Yes	
63.2	Definitions	Yes	
63.3	Units and abbreviations	Yes	
63.4	Prohibited activities	Yes	
63.5	Construction/reconstruction	Yes	
63.6(a) through (d)	Compliance applicability and dates	Yes	
63.6(e)	Operating and maintenance requirements.	No	This subpart specifies operating and maintenance requirements.
63.6(f)(1)	Applicability of non-opacity emission standards.	No	This subpart specifies applicability of non-opacity emission standards.
63.6(f)(2) through (3)	Methods and finding of compliance with non-opacity emission standards.	Yes	
63.6(g)	Use of an alternative nonopacity emission standard.	Yes	
63.6(h)(1)	Applicability of opacity and visible emissions standards.	No	This subpart specifies applicability of opacity and visible emission standards.
63.6(h)(2) through (9)	Methods and other requirements for opacity and visible emissions standards.	Yes	
63.6(i) through (j)	Compliance extension and Presidential compliance exemption.	Yes	
63.7(a)(1) through (2)	Applicability and performance test dates	No	This subpart specifies applicability and performance test dates.
63.7(a)(3) through (4)	Administrators rights to require a performance test and force majeure provisions.	Yes	
63.7(b) through (d)	Notification of performance test, quality assurance program, and testing facilities.	Yes	
63.7(e)(1)	Performance test conditions	No	This subpart specifies performance test conditions.
63.7(e)(2) through (4), (f) through (h)	Other performance testing requirements	Yes	
63.8(a)(1) through (3), (b), (c)(1)(ii), (c)(2) through (3), (c)(6) through (8), (d)(1) through (2).	Monitoring requirements	Yes	
63.8(a)(4)	Additional monitoring requirements for control devices in § 63.11.	No	This subpart does not require flares.
63.8(c)(1)(i), (c)(1)(iii)	Operation and maintenance of continuous monitoring systems.	No	Not necessary in light of other requirements of § 63.8 that apply.
63.8(c)(4)	CMS requirements	No	This subpart specifies requirements for operation of CMS and CEMS.
63.8(c)(5)	Continuous opacity monitoring system (COMS) Minimum Procedures.	No	This subpart does not require COMS.
63.8(d)(3)	Quality control program	No	This subpart specifies records that must be kept associated with site-specific performance evaluation test plan.
63.8(e), (f)(1) through (6), (g)(1) through (4).	Performance evaluations and alternative monitoring.	Yes	This subpart specifies requirements for alternative monitoring systems.
63.8(g)(5)	Data reduction	No	This subpart specifies data reduction requirements.
63.9	Notification requirements	Yes	Except: for opacity performance tests, this subpart allows the notification of compliance status to be submitted with the semiannual compliance report or the semiannual part 70 of this chapter monitoring report.
63.10(a),(b)(1), (b)(2)(iii) and (vi) through (xiv), (b)(3), (c)(1) through (6), (c)(9) through (14), (d)(1) through (4), (e)(1) through (2), (f).	Recordkeeping and reporting requirements.	Yes	Additional records for CMS in § 63.10(c)(1)-(6), (9)-(15) apply only to CEMS.
63.10(b)(2)(i), (ii), (iv) and (v)	Recordkeeping for startup, shutdown, and malfunction events.	No	

TABLE 1 TO SUBPART EEEEE OF PART 63—APPLICABILITY OF GENERAL PROVISIONS TO THIS SUBPART—Continued

[As stated in § 63.7760, you must meet each requirement in the following table that applies to you]

Citation	Subject	Applies to this subpart?	Explanation
63.10(c)(7), (8) and (15)	Records of excess emissions and parameter monitoring exceedances for CMS.	No	This subpart specifies records requirements.
63.10(d)(5)	Periodic startup, shutdown, and malfunction reports.	No	
63.10(e)(3)	Excess emissions reports	No	This subpart specifies reporting requirements.
63.10(e)(4)	Reporting COMS data	No	This subpart data does not require COMS.
63.11	Control device requirements	No	This subpart does not require flares.
63.12	State authority and delegations	Yes	
63.13(a)	Reporting to EPA regional offices	Yes	Except: reports and notifications required to be submitted to CEDRI meet this obligation through electronic reporting.
63.13(b) through 63.15	Addresses of state air pollution control agencies. Incorporation by reference. Availability of information and confidentiality.	Yes	

Subpart ZZZZZ—National Emission Standards for Hazardous Air Pollutants for Iron and Steel Foundries Area Sources

■ 16. Section 63.10885 is amended by revising paragraph (a)(1) to read as follows:

§ 63.10885 What are my management practices for metallic scrap and mercury switches?

(a) * * *

(1) *Restricted metallic scrap.* You must prepare and operate at all times according to written material specifications for the purchase and use of only metal ingots, pig iron, slitter, or other materials that do not include post-consumer automotive body scrap, post-consumer engine blocks, post-consumer oil filters, oily turnings, lead components, chlorinated plastics, or free liquids. For the purpose of this subpart, ''free liquids'' is defined as material that fails the paint filter test by EPA Method 9095B, ''Paint Filter Liquids Test'' (revision 2), November 2004 (incorporated by reference—see § 63.14). The requirements for no free liquids do not apply if the owner or operator can demonstrate that the free liquid is water that resulted from scrap exposure to rain. Any post-consumer engine blocks, post-consumer oil filters, or oily turnings that are processed and/or cleaned to the extent practicable such that the materials do not include lead components, mercury switches, chlorinated plastics, or free organic liquids can be included in this certification.

* * * * *

■ 17. Section 63.10890 is amended by revising paragraphs (c) introductory text, (d), (e)(3), (f), and (i) and adding paragraph (j) to read as follows:

§ 63.10890 What are my management practices and compliance requirements?

* * * * *

(c) You must submit a notification of compliance status according to § 63.9(h)(2)(i). You must send the notification of compliance status before the close of business on the 30th day after the applicable compliance date specified in § 63.10881. The notification must include the following compliance certifications, as applicable:

* * * * *

(d) As required by § 63.10(b)(1), you must maintain files of all information (including all reports and notifications) for at least 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record. At a minimum, the most recent 2 years of data shall be retained on site. The remaining 3 years of data may be retained off site. Such files may be maintained on microfilm, on a computer, on computer floppy disks, on magnetic tape disks, or on microfiche. Any records required to be maintained by this part that are submitted electronically via the EPA's Compliance and Emissions Data Reporting Interface (CEDRI) may be maintained in electronic format. This ability to maintain electronic copies does not affect the requirement for facilities to make records, data, and reports available upon request to a delegated air agency or the EPA as part of an on-site compliance evaluation.

(e) * * *

(3) If you are subject to the requirements for a site-specific plan for mercury switch removal under § 63.10885(b)(1), you must maintain records of the number of mercury switches removed or the weight of mercury recovered from the switches and properly managed, the estimated number of vehicles processed, and an estimate of the percent of mercury switches recovered.

* * * * *

(f) You must submit semiannual compliance reports to the Administrator according to the requirements in § 63.10899(c), (f), and (g), except that § 63.10899(c)(5) and (7) do not apply.

* * * * *

(i) At all times, you must operate and maintain any affected source, including associated air pollution control equipment and monitoring equipment, in a manner consistent with safety and good air pollution control practices for minimizing emissions.

(j) You must comply with the following requirements of the general provisions in subpart A of this part: §§ 63.1 through 63.5; § 63.6(a), (b), and (c); § 63.9; § 63.10(a), (b)(1), (b)(2)(xiv), (b)(3), (d)(1) and (4), and (f); and §§ 63.13 through 63.16. Requirements of the general provisions not cited in the preceding sentence do not apply to the owner or operator of a new or existing affected source that is classified as a small foundry.

■ 18. Section 63.10896 is amended by adding paragraph (c) to read as follows:

§ 63.10896 What are my operation and maintenance requirements?

* * * * *

(c) At all times, you must operate and maintain any affected source, including associated air pollution control equipment and monitoring equipment, in a manner consistent with safety and good air pollution control practices for minimizing emissions.

■ 19. Section 63.10897 is amended by revising paragraphs (d)(1)(i), (d)(3) introductory text, and (g) to read as follows:

§ 63.10897 What are my monitoring requirements?

* * * * *

(d) * * *

(1) * * *

(i) The system must be certified by the manufacturer to be capable of detecting emissions of particulate matter at concentrations of 10 milligrams per actual cubic meter (0.0044 grains per actual cubic foot) or less.

* * * * *

(3) In the event that a bag leak detection system alarm is triggered, you must initiate corrective action to determine the cause of the alarm within 1 hour of the alarm, initiate corrective action to correct the cause of the problem within 24 hours of the alarm, and complete corrective action as soon as practicable, but no later than 10 calendar days from the date of the alarm. You must record the date and time of each valid alarm, the time you initiated corrective action, the corrective action taken, and the date on which corrective action was completed. Corrective actions may include, but are not limited to:

* * * * *

(g) In the event of an exceedance of an established emissions limitation (including an operating limit), you must restore operation of the emissions source (including the control device and associated capture system) to its normal or usual manner or operation as expeditiously as practicable in accordance with good air pollution control practices for minimizing emissions. The response shall include taking any necessary corrective actions to restore normal operation and prevent the likely recurrence of the exceedance. You must record the date and time corrective action was initiated, the corrective action taken, and the date corrective action was completed.

* * * * *

■ 20. Section 63.10898 is amended by revising paragraph (c) to read as follows:

§ 63.10898 What are my performance test requirements?

* * * * *

(c) You must conduct each performance test under conditions representative of normal operations according to the requirements in Table 1 to this subpart and paragraphs (d) through (g) of this section. Normal operating conditions exclude periods of startup and shutdown. You may not conduct performance tests during periods of malfunction. You must record the process information that is necessary to document operating conditions during the test and include in such record an explanation to support that such conditions represent normal operation. Upon request, you shall make available to the Administrator such records as may be necessary to determine the conditions of performance tests.

* * * * *

■ 21. Section 63.10899 is amended is amended by:

■ a. Revising paragraphs (a), (b) introductory text, and (b)(2);

■ b. Adding paragraphs (b)(14) and (15);

■ c. Revising paragraph (c); and

■ d. Adding paragraphs (e) through (g).

The revisions and additions read as follows:

§ 63.10899 What are my recordkeeping and reporting requirements?

(a) As required by § 63.10(b)(1), you must maintain files of all information (including all reports and notifications) for at least 5 years following the date of each occurrence, measurement, maintenance, corrective action, report, or record. At a minimum, the most recent 2 years of data shall be retained on site. The remaining 3 years of data may be retained off site. Such files may be maintained on microfilm, on a computer, on computer floppy disks or flash drives, on magnetic tape disks, or on microfiche. Any records required to be maintained by this part that are submitted electronically via the EPA's CEDRI may be maintained in electronic format. This ability to maintain electronic copies does not affect the requirement for facilities to make records, data, and reports available upon request to a delegated air agency or the EPA as part of an on-site compliance evaluation.

(b) In addition to the records required by § 63.10(b)(2)(iii) and (vi) through (xiv) and (b)(3), you must keep records of the information specified in paragraphs (b)(1) through (15) of this section.

* * * * *

(2) If you are subject to the requirements for a site-specific plan for mercury under § 63.10885(b)(1), you must maintain records of the number of mercury switches removed or the weight of mercury recovered from the switches and properly managed, the estimated number of vehicles processed, and an estimate of the percent of mercury switches recovered.

* * * * *

(14) You must keep records of the site-specific performance evaluation test plan required under § 63.8(d)(2) for the life of the affected source or until the affected source is no longer subject to the provisions of this part, to be made available for inspection, upon request, by the Administrator. If the performance evaluation plan is revised, you shall keep previous (*i.e.,* superseded) versions of the performance evaluation plan on record to be made available for inspection, upon request, by the Administrator, for a period of 5 years after each revision to the plan. The program of corrective action should be included in the plan as required under § 63.8(d)(2)(vi).

(15) You must keep the following records for each failure to meet an emissions limitation (including operating limit), work practice standard, or operation and maintenance requirement in this subpart.

(i) Date, start time, and duration of each failure.

(ii) List of the affected sources or equipment for each failure, an estimate of the quantity of each regulated pollutant emitted over any emission limit and a description of the method used to estimate the emissions.

(iii) Actions taken to minimize emissions in accordance with § 63.10896(c), and any corrective actions taken to return the affected unit to its normal or usual manner of operation.

(c) Prior to March 9, 2021, you must submit semiannual compliance reports to the Administrator according to the requirements in § 63.13. Beginning on March 9, 2021, you must submit all subsequent semiannual compliance reports to the EPA via the CEDRI, which can be accessed through the EPA's Central Data Exchange (CDX) (*https://cdx.epa.gov/*). The EPA will make all the information submitted through CEDRI available to the public without further notice to you. Do not use CEDRI to submit information you claim as confidential business information (CBI). Anything submitted using CEDRI cannot later be claimed to be CBI. You must use the appropriate electronic report template on the CEDRI website (*https://www.epa.gov/electronic-reporting-air-emissions/cedri*) for this subpart. The date report templates become available

will be listed on the CEDRI website. The report must be submitted by the deadline specified in this subpart, regardless of the method in which the report is submitted. Although we do not expect persons to assert a claim of CBI, if persons wish to assert a CBI if you claim some of the information required to be submitted via CEDRI is CBI, submit a complete report, including information claimed to be CBI, to the EPA. The report must be generated using the appropriate form on the CEDRI website or an alternate electronic file consistent with the extensible markup language (XML) schema listed on the CEDRI website. Submit the file on a compact disc, flash drive, or other commonly used electronic storage medium and clearly mark the medium as CBI. Mail the electronic medium to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404–02, 4930 Old Page Rd., Durham, NC 27703. The same file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described earlier in this paragraph (c). All CBI claims must be asserted at the time of submission. Furthermore, under CAA section 114(c) emissions data is not entitled to confidential treatment and requires EPA to make emissions data available to the public. Thus, emissions data will not be protected as CBI and will be made publicly available. The reports must include the information specified in paragraphs (c)(1) through (3) of this section and, as applicable, paragraphs (c)(4) through (9) of this section.

(1) Company name and address.

(2) Statement by a responsible official, with that official's name, title, and signature, certifying the truth, accuracy, and completeness of the content of the report.

(3) Date of report and beginning and ending dates of the reporting period.

(4) If there were no deviations from any emissions limitations (including operating limits, pollution prevention management practices, or operation and maintenance requirements), a statement that there were no deviations from the emissions limitations, pollution prevention management practices, or operation and maintenance requirements during the reporting period.

(5) If there were no periods during which a continuous monitoring system (including a CPMS or continuous emissions monitoring system (CEMS) was inoperable or out-of-control as specified by § 63.8(c)(7), a statement that there were no periods during which the CPMS was inoperable or out-of-control during the reporting period.

(6) For each affected source or equipment for which there was a deviation from an emissions limitation (including an operating limit, pollution prevention management practice, or operation and maintenance requirement) that occurs at an iron and steel foundry during the reporting period, the compliance report must contain the information specified in paragraphs (c)(6)(i) through (iii) of this section. The requirement in this paragraph (c)(6) includes periods of startup, shutdown, and malfunction.

(i) A list of the affected source or equipment and the total operating time of each emissions source during the reporting period.

(ii) For each deviation from an emissions limitation (including an operating limit, pollution prevention management practice, or operation and maintenance requirement) that occurs at an iron and steel foundry during the reporting period, report:

(A) The date, start time, duration (in hours), and cause of each deviation (characterized as either startup, shutdown, control equipment problem, process problem, other known cause, or unknown cause, as applicable) and the corrective action taken; and

(B) An estimate of the quantity of each regulated pollutant emitted over any emission limit and a description of the method used to estimate the emissions.

(iii) A summary of the total duration (in hours) of the deviations that occurred during the reporting period by cause (characterized as startup, shutdown, control equipment problems, process problems, other known causes, and unknown causes) and the cumulative duration of deviations during the reporting period across all causes both in hours and as a percent of the total source operating time during the reporting period.

(7) For each continuous monitoring system (including a CPMS or CEMS) used to comply with the emissions limitation or work practice standard in this subpart that was inoperable or out-of-control during any portion of the reporting period, you must include the information specified in paragraphs (c)(7)(i) through (vi) of this section. The requirement in this paragraph (c)(7) includes periods of startup, shutdown, and malfunction.

(i) A brief description of the continuous monitoring system, including manufacturer and model number.

(ii) The date of the latest continuous monitoring system certification or audit.

(iii) A brief description and the total operating time of the affected source or equipment that is monitored by the continuous monitoring system during the reporting period.

(iv) A description of any changes in continuous monitoring systems, processes, or controls since the last reporting period.

(v) For each period for which the continuous monitoring system was inoperable or out-of-control during the reporting period, report:

(A) The date, start time, and duration (in hours) of the deviation;

(B) The type of deviation (inoperable or out-of-control); and

(C) The cause of deviation (characterized as monitoring system malfunctions, non-monitoring equipment malfunctions, quality assurance/quality control calibrations, other known causes, and unknown causes, as applicable) and the corrective action taken.

(vi) A summary of the total duration (in hours) of the deviations that occurred during the reporting period by cause (characterized as monitoring system malfunctions, non-monitoring equipment malfunctions, quality assurance/quality control calibrations, other known causes, and unknown causes) and the cumulative duration of deviations during the reporting period across all causes both in hours and as a percent of the total source operating time during the reporting period.

(8) Identification of which option in § 63.10885(b) applies to you. If you comply with the mercury requirements in § 63.10885(b) by using one scrap provider, contract, or shipment subject to one compliance provision and others subject to another compliance provision different, provide an identification of which option in § 63.10885(b) applies to each scrap provider, contract, or shipment.

(9) If you are subject to the requirements for a site-specific plan for mercury under § 63.10885(b)(1), include:

(i) The number of mercury switches removed or the weight of mercury recovered from the switches and properly managed, the estimated number of vehicles processed, an estimate of the percent of mercury switches recovered;

(ii) A certification that the recovered mercury switches were recycled at RCRA-permitted facilities; and

(iii) A certification that you have conducted periodic inspections or taken other means of corroboration as required under § 63.10885(b)(1)(ii)(C).

* * * * *

(e) Within 60 days after the date of completing each performance test required by this subpart, you must

submit the results of the performance test following the procedures specified in paragraphs (e)(1) through (3) of this section.

(1) *Data collected using test methods supported by the EPA's Electronic Reporting Tool (ERT) as listed on the EPA's ERT website (https://www.epa.gov/electronic-reporting-air-emissions/electronic-reporting-tool-ert) at the time of the test.* Submit the results of the performance test to the EPA via the CEDRI, which can be accessed through the EPA's CDX (*https://cdx.epa.gov/*). The data must be submitted in a file format generated through the use of the EPA's ERT. Alternatively, you may submit an electronic file consistent with the XML schema listed on the EPA's ERT website.

(2) *Data collected using test methods that are not supported by the EPA's ERT as listed on the EPA's ERT website at the time of the test.* The results of the performance test must be included as an attachment in the ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT website. Submit the ERT generated package or alternative file to the EPA via CEDRI.

(3) *Confidential business information.* The EPA will make all the information submitted through CEDRI available to the public without further notice to you. Do not use CEDRI to submit information you claim as CBI. Anything submitted using CEDRI cannot later be claimed to be CBI. Although we do not expect persons to assert a claim of CBI if you claim some of the information submitted under paragraph (e)(1) or (2) of this section is CBI, you must submit a complete file, including information claimed to be CBI, to the EPA. The file must be generated through the use of the EPA's ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT website. Submit the file on a compact disc, flash drive, or other commonly used electronic storage medium and clearly mark the medium as CBI. Mail the electronic medium to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404–02, 4930 Old Page Rd., Durham, NC 27703. The same file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described in paragraph (e)(1) of this section. All CBI claims must be asserted at the time of submission. Furthermore, under CAA section 114(c) emissions data is not entitled to confidential treatment and requires EPA to make emissions data available to the public. Thus, emissions data will not be protected as CBI and will be made publicly available.

(f) If you are required to electronically submit a report through CEDRI in the EPA's CDX, you may assert a claim of EPA system outage for failure to timely comply with the reporting requirement. To assert a claim of EPA system outage, you must meet the requirements outlined in paragraphs (f)(1) through (7) of this section.

(1) You must have been or will be precluded from accessing CEDRI and submitting a required report within the time prescribed due to an outage of either the EPA's CEDRI or CDX systems.

(2) The outage must have occurred within the period of time beginning 5 business days prior to the date that the submission is due.

(3) The outage may be planned or unplanned.

(4) You must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or has caused a delay in reporting.

(5) You must provide to the Administrator a written description identifying:

(i) The date(s) and time(s) when CDX or CEDRI was accessed and the system was unavailable;

(ii) A rationale for attributing the delay in reporting beyond the regulatory deadline to EPA system outage;

(iii) Measures taken or to be taken to minimize the delay in reporting; and

(iv) The date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported.

(6) The decision to accept the claim of EPA system outage and allow an extension to the reporting deadline is solely within the discretion of the Administrator.

(7) In any circumstance, the report must be submitted electronically as soon as possible after the outage is resolved.

(g) If you are required to electronically submit a report through CEDRI in the EPA's CDX, you may assert a claim of force majeure for failure to timely comply with the reporting requirement. To assert a claim of force majeure, you must meet the requirements outlined in paragraphs (g)(1) through (5) of this section.

(1) You may submit a claim if a force majeure event is about to occur, occurs, or has occurred or there are lingering effects from such an event within the period of time beginning five business days prior to the date the submission is due. For the purposes of this section, a force majeure event is defined as an event that will be or has been caused by circumstances beyond the control of the affected facility, its contractors, or any entity controlled by the affected facility that prevents you from complying with the requirement to submit a report electronically within the time period prescribed. Examples of such events are acts of nature (*e.g.,* hurricanes, earthquakes, or floods), acts of war or terrorism, or equipment failure or safety hazard beyond the control of the affected facility (*e.g.,* large scale power outage).

(2) You must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or has caused a delay in reporting.

(3) You must provide to the Administrator:

(i) A written description of the force majeure event;

(ii) A rationale for attributing the delay in reporting beyond the regulatory deadline to the force majeure event;

(iii) Measures taken or to be taken to minimize the delay in reporting; and

(iv) The date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported.

■ 22. Section 63.10905 is amended by revising paragraph (c) introductory text and adding paragraph (c)(7) to read as follows:

§ 63.10905 Who implements and enforces this subpart?

* * * * *

(c) The authorities that cannot be delegated to state, local, or tribal agencies are specified in paragraphs (c)(1) through (7) of this section.

* * * * *

(7) Approval of an alternative to any electronic reporting to the EPA required by this subpart.

■ 23. Section 63.10906 is amended by revising the definition for ''Deviation'' to read as follows:

§ 63.10906 What definitions apply to this subpart?

* * * * *

Deviation means any instance in which an affected source or an owner or operator of such an affected source:

(1) Fails to meet any requirement or obligation established by this subpart including, but not limited to, any emissions limitation (including operating limits), management practice, or operation and maintenance requirement; or

(2) Fails to meet any term or condition that is adopted to implement an applicable requirement in this subpart

and that is included in the operating permit for any iron and steel foundry required to obtain such a permit.

* * * * *

■ 24. Table 3 to subpart ZZZZZ of part 63 is revised to read as follows:

TABLE 3 TO SUBPART ZZZZZ OF PART 63—APPLICABILITY OF GENERAL PROVISIONS TO NEW AND EXISTING AFFECTED SOURCES CLASSIFIED AS LARGE FOUNDRIES

[As required in § 63.10900(a), you must meet each requirement in the following table that applies to you]

Citation	Subject	Applies to large foundry?	Explanation
63.1	Applicability	Yes.	
63.2	Definitions	Yes.	
63.3	Units and abbreviations	Yes.	
63.4	Prohibited activities	Yes.	
63.5	Construction/reconstruction	Yes.	
63.6(a) through (d)	Compliance applicability and dates	Yes.	
63.6(e)	Operating and maintenance requirements.	No	This subpart specifies operating and maintenance requirements.
63.6(f)(1)	Applicability of non-opacity emission standards.	No	This subpart specifies applicability of non-opacity emission standards.
63.6(f)(2) through (3)	Methods and finding of compliance with non-opacity emission standards.	Yes.	
63.6(g)	Use of an alternative nonopacity emission standard.	Yes.	
63.6(h)(1)	Applicability of opacity and visible emissions standards.	No	This subpart specifies applicability of opacity and visible emission standards.
63.6(h)(2) through (9)	Methods and other requirements for opacity and visible emissions standards.	Yes.	
63.6(i) through (j)	Compliance extension and Presidential compliance exemption.	Yes.	
63.7(a)(1) through (2)	Applicability and performance test dates.	No	This subpart specifies applicability and performance test dates.
63.7(a)(3) through (4)	Administrators rights to require a performance test and force majeure provisions.	Yes.	
63.7(b) through (d)	Notification of performance test, quality assurance program, and testing facilities.	Yes.	
63.7(e)(1)	Performance test conditions	No	This subpart specifies performance test conditions.
63.7(e)(2) through (4), (f) through (h)	Other performance testing requirements.	Yes.	
63.8(a)(1) through (3), (b), (c)(1)(ii), (c)(2) through (3), (c)(6) through (8), (d)(1) through (2).	Monitoring requirements	Yes.	
63.8(a)(4)	Additional monitoring requirements for control devices in § 63.11.	No.	
63.8(c)(1)(i), (c)(1)(iii)	Operation and maintenance of continuous monitoring systems.	No	Not necessary in light of other requirements of § 63.8 that apply.
63.8(c)(4)	Continuous monitoring system (CMS) requirements.	No.	
63.8(c)(5)	Continuous opacity monitoring system (COMS) minimum procedures.	No.	
63.8(d)(3)	Quality control program	No	This subpart specifies records that must be kept associated with site-specific performance evaluation test plan.
63.8(e), (f)(1) through (6), (g)(1) through (4).	Performance evaluations and alternative monitoring.	Yes.	
63.8(g)(5)	Data reduction	No.	
63.9	Notification requirements	Yes.	Except for opacity performance tests.
63.10(a), (b)(1), (b)(2)(xii) through (xiv), (b)(3), (d)(1) through (4), (e)(1) through (2), (f).	Recordkeeping and reporting requirements.	Yes.	
63.10(b)(2)(i) through (xi)	Malfunction and CMS records	No.	
63.10(c)	Additional records for CMS	No	This subpart specifies records requirements.
63.10(d)(5)	Periodic startup, shutdown, and malfunction reports.	No.	
63.10(e)(3)	Excess emissions reports	No	This subpart specifies reporting requirements.
63.10(e)(4)	Reporting COMS data	No.	

TABLE 3 TO SUBPART ZZZZZ OF PART 63—APPLICABILITY OF GENERAL PROVISIONS TO NEW AND EXISTING AFFECTED SOURCES CLASSIFIED AS LARGE FOUNDRIES—Continued

[As required in § 63.10900(a), you must meet each requirement in the following table that applies to you]

Citation	Subject	Applies to large foundry?	Explanation
63.11	Control device requirements	No.	
63.12	State authority and delegations	Yes.	
63.13(a)	Reporting to EPA regional offices	Yes	Except: reports and notifications required to be submitted to CEDRI meet this obligation through electronic reporting.
63.13(b) through 63.16	Addresses of state air pollution control agencies. Incorporation by reference. Availability of information and confidentiality. Performance track provisions.	Yes.

National Emission Standards for Hazardous Air Pollutants: Lime Manufacturing Plants Residual Risk and Technology Review

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This action finalizes the residual risk and technology review (RTR) conducted for the Lime Manufacturing source category regulated under national emission standards for hazardous air pollutants (NESHAP). In addition, we are taking final action addressing periods of startup, shutdown, and malfunction (SSM). These final amendments include new provisions requiring electronic reporting. We are finalizing our proposed determination that the risks are acceptable and that the current NESHAP provides an ample margin of safety to protect public health. We determined that there are no developments in practices, processes, or control technologies that necessitate revisions to the standards.

DATES: This final rule is effective on July 24, 2020. The incorporation by reference (IBR) of certain publications listed in the rule is approved by the Director of the Federal Register as of July 24, 2020.

ADDRESSES: The U.S. Environmental Protection Agency (EPA) has established a docket for this action under Docket ID No. EPA–HQ–OAR–2017–0015. All documents in the docket are listed on the *https://www.regulations.gov/* website. Although listed, some information is not publicly available, *e.g.,* Confidential Business Information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the internet and will be publicly available only in hard copy form. Publicly available docket materials are available electronically through *https://www.regulations.gov/.* Out of an abundance of caution for members of the public and our staff, the EPA Docket Center and Reading Room was closed to public visitors on March 31, 2020, to reduce the risk of transmitting COVID–19. Our Docket Center staff will continue to provide remote customer service via email, phone, and webform. There is a temporary suspension of mail delivery to the EPA, and no hand deliveries are currently accepted. For further information and updates on EPA Docket Center services and the current status, please visit us online at *https://www.epa.gov/dockets.*

FOR FURTHER INFORMATION CONTACT: For questions about this final action, contact Jim Eddinger, Sector Policies and Programs Division (D243–01), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–5426; and email address: *eddinger.jim@epa.gov.* For specific information regarding the risk modeling methodology, contact James Hirtz, Health and Environmental Impacts Division (C539–02), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–0881; and email address: *hirtz.james@epa.gov.* For information about the applicability of the NESHAP to a particular entity, contact Sara Ayres, Office of Enforcement and Compliance Assurance, U.S. Environmental Protection Agency, U.S. EPA Region 5 (Mail Code E–19), 77 West Jackson Boulevard, Chicago, Illinois 60604; telephone number: (312) 353–6266; and email address: *ayres.sara@epa.gov.*

SUPPLEMENTARY INFORMATION:

Preamble acronyms and abbreviations. We use multiple acronyms and terms in this preamble. While this list may not be exhaustive, to ease the reading of this preamble and for reference purposes, the EPA defines the following terms and acronyms here:

ACI activated carbon injection

VCS voluntary consensus standard

Background information. On September 16, 2019, the EPA proposed revisions to the Lime Manufacturing Plants NESHAP based on our RTR. In this action, we are finalizing decisions and revisions for the rule. We summarize some of the more significant comments we timely received regarding the proposed rule and provide our responses in this preamble. A summary of all other public comments on the proposal and the EPA's responses to those comments is available in *Summary of Public Comments and Responses for the Lime Manufacturing Plants Residual Risk and Technology Review,* Docket ID No. EPA–HQ–OAR–2017–0015. A ''track changes'' version of the regulatory language that incorporates the changes in this action is available in the docket.

Organization of this document. The information in this preamble is organized as follows:

Table of Contents

I. General Information
A. Does this action apply to me?
B. Where can I get a copy of this document and other related information?
C. Judicial Review and Administrative Reconsideration
II. Background
A. What is the statutory authority for this action?
B. What is the Lime Manufacturing source category and how does the NESHAP regulate HAP emissions from the source category?

C. What changes did we propose for the Lime Manufacturing source category in our September 16, 2019, proposal?
III. What is included in this final rule?
A. What are the final rule amendments based on the risk review for the Lime Manufacturing source category?
B. What are the final rule amendments based on the technology review for the Lime Manufacturing source category?
C. What are the final rule amendments addressing emissions during periods of SSM?
D. What other changes have been made to the NESHAP?
E. What are the effective and compliance dates of the standards?
IV. What is the rationale for our final decisions and amendments for the Lime Manufacturing source category?
A. Residual Risk Review for the Lime Manufacturing Source Category
B. Technology Review for the Lime Manufacturing Source Category
C. SSM for the Lime Manufacturing Source Category
D. Electronic Reporting Requirements for the Lime Manufacturing Source Category
E. IBR
F. Technical and Editorial Changes for the Lime Manufacturing source category
V. Summary of Cost, Environmental, and Economic Impacts and Additional Analyses Conducted
A. What are the affected facilities?
B. What are the air quality impacts?
C. What are the cost impacts?
D. What are the economic impacts?
E. What are the benefits?
F. What analysis of environmental justice did we conduct?
G. What analysis of children's environmental health did we conduct?
VI. Statutory and Executive Order Reviews
A. Executive Orders 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review
B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs
C. Paperwork Reduction Act (PRA)
D. Regulatory Flexibility Act (RFA)
E. Unfunded Mandates Reform Act (UMRA)
F. Executive Order 13132: Federalism
G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks
I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
J. National Technology Transfer and Advancement Act (NTTAA) and 1 CFR part 51
K. Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations
L. Congressional Review Act (CRA)

I. General Information

A. Does this action apply to me?

Regulated entities. Categories and entities potentially regulated by this action are shown in Table 1 of this preamble.

TABLE 1—NESHAP AND INDUSTRIAL SOURCE CATEGORIES AFFECTED BY THIS FINAL ACTION

NESHAP and source category	NAICS[1] code
Lime Manufacturing Plants	32741, 33111, 3314, 327125

[1] North American Industry Classification System.

Table 1 of this preamble is not intended to be exhaustive, but rather to provide a guide for readers regarding entities likely to be affected by the final action for the source category listed. To determine whether your facility is affected, you should examine the applicability criteria in the appropriate NESHAP. If you have any questions regarding the applicability of any aspect of this NESHAP, please contact the appropriate person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section of this preamble.

B. Where can I get a copy of this document and other related information?

In addition to being available in the docket, an electronic copy of this final action will also be available on the internet. Following signature by the EPA Administrator, the EPA will post a copy of this final action at: *https://www.epa.gov/lime-manufacturing-plants-national-emission-standards-hazardous-air.* Following publication in the **Federal Register**, the EPA will post the **Federal Register** version and key technical documents at this same website.

Additional information is available on the RTR website at *https://www.epa.gov/stationary-sources-air-pollution/risk-and-technology-review-national-emissions-standards-hazardous.* This information includes an overview of the RTR program and links to project websites for the RTR source categories.

C. Judicial Review and Administrative Reconsideration

Under Clean Air Act (CAA) section 307(b)(1), judicial review of this final action is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit (the Court) by September 22, 2020. Under CAA section 307(b)(2), the requirements established by this final rule may not be challenged separately in any civil or criminal proceedings brought by the EPA to enforce the requirements.

Section 307(d)(7)(B) of the CAA further provides that only an objection to a rule or procedure which was raised with reasonable specificity during the period for public comment (including any public hearing) may be raised during judicial review. This section also provides a mechanism for the EPA to reconsider the rule if the person raising an objection can demonstrate to the Administrator that it was impracticable to raise such objection within the period for public comment or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule. Any person seeking to make such a demonstration should submit a Petition for Reconsideration to the Office of the Administrator, U.S. EPA, Room 3000, WJC South Building, 1200 Pennsylvania Ave. NW, Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. EPA, 1200 Pennsylvania Ave. NW, Washington, DC 20460.

II. Background

A. What is the statutory authority for this action?

Section 112 of the CAA establishes a two-stage regulatory process to address emissions of hazardous air pollutants (HAP) from stationary sources. In the first stage, we must identify categories of sources emitting one or more of the HAP listed in CAA section 112(b) and then promulgate technology-based NESHAP for those sources. ''Major sources'' are those that emit, or have the potential to emit, any single HAP at a rate of 10 tons per year (tpy) or more, or 25 tpy or more of any combination of

HAP. For major sources, these standards are commonly referred to as maximum achievable control technology (MACT) standards and must reflect the maximum degree of emission reductions of HAP achievable (after considering cost, energy requirements, and non-air quality health and environmental impacts). In developing MACT standards, CAA section 112(d)(2) directs the EPA to consider the application of measures, processes, methods, systems, or techniques, including, but not limited to, those that reduce the volume of or eliminate HAP emissions through process changes, substitution of materials, or other modifications; enclose systems or processes to eliminate emissions; collect, capture, or treat HAP when released from a process, stack, storage, or fugitive emissions point; are design, equipment, work practice, or operational standards; or any combination of the above.

For these MACT standards, the statute specifies certain minimum stringency requirements, which are referred to as MACT floor requirements, and which may not be based on cost considerations. See CAA section 112(d)(3). For new sources, the MACT floor cannot be less stringent than the emission control achieved in practice by the best-controlled similar source. The MACT standards for existing sources can be less stringent than floors for new sources, but they cannot be less stringent than the average emission limitation achieved by the best-performing 12 percent of existing sources in the category or subcategory (or the best-performing five sources for categories or subcategories with fewer than 30 sources). In developing MACT standards, we must also consider control options that are more stringent than the floor under CAA section 112(d)(2). We may establish standards more stringent than the floor, based on the consideration of the cost of achieving the emissions reductions, any non-air quality health and environmental impacts, and energy requirements.

In the second stage of the regulatory process, the CAA requires the EPA to undertake two different analyses, which we refer to as the technology review and the residual risk review. Under the technology review, we must review the technology-based standards and revise them ''as necessary (taking into account developments in practices, processes, and control technologies)'' no less frequently than every 8 years, pursuant to CAA section 112(d)(6). Under the residual risk review, we must evaluate the risk to public health remaining after application of the technology-based standards and revise the standards, if necessary, to provide an ample margin of safety to protect public health or to prevent, taking into consideration costs, energy, safety, and other relevant factors, an adverse environmental effect. The residual risk review is required within 8 years after promulgation of the technology-based standards, pursuant to CAA section 112(f). In conducting the residual risk review, if the EPA determines that the current standards provide an ample margin of safety to protect public health, it is not necessary to revise the MACT standards pursuant to CAA section 112(f).[1] For more information on the statutory authority for this rule, see 84 FR 48708, September 16, 2019.

B. What is the Lime Manufacturing source category and how does the NESHAP regulate HAP emissions from the source category?

The EPA promulgated the Lime Manufacturing Plants NESHAP on January 5, 2004 (69 FR 394). The standards are codified at 40 CFR part 63, subpart AAAAA. The lime manufacturing industry consists of facilities that use a lime kiln to produce lime product from limestone by calcination. The source category covered by this MACT standard currently includes 35 facilities.

As promulgated in 2004, the NESHAP regulates HAP emissions from all new and existing lime manufacturing plants that are major sources, co-located with major sources, or are part of major sources. However, lime manufacturing plants located at pulp and paper mills or at beet sugar factories are not subject to the NESHAP. Other captive lime manufacturing plants, such as (but not limited to) those at steel mills and magnesia production facilities, are subject to the NESHAP. See 67 FR 78053 explaining the basis for these determinations. A lime manufacturing plant is defined as any plant which uses a lime kiln to produce lime product from limestone or other calcareous material by calcination. However, the NESHAP specifically excludes lime kilns that use only calcium carbonate waste sludge from water softening processes as the feedstock.

The NESHAP defines the affected source as follows: Each lime kiln and its associated cooler and each individual processed stone handling (PSH) operations system. The PSH operations system includes all equipment associated with PSH operations beginning at the process stone storage bin(s) or open storage pile(s) and ending where the process stone is fed into the kiln. It includes man-made process stone storage bins (but not open process stone storage piles), conveying system transfer points, bulk loading or unloading systems, screening operations, surge bins, bucket elevators, and belt conveyors. The materials processing operations associated with lime products, lime kiln dust handling, quarry or mining operations, limestone sizing operations, and fuels are not subject to the NESHAP. Finally, lime hydrators and cooler nuisance dust collectors are not included under the definition of affected source under the NESHAP.

The NESHAP established particulate matter (PM) emission limits for lime kilns, coolers, and PSH operations with stacks. The NESHAP also established opacity limits for PSH operations without stacks and for kilns equipped with electrostatic precipitators (ESP) and fabric filters (FF). For kilns equipped with wet scrubbers, the NESHAP established scrubbing liquid flow rate and exhaust gas stream pressure drop limits. PM serves as a surrogate for the non-volatile and semi-volatile metal HAP. The NESHAP also regulates opacity or visible emissions from most of the PSH operations, with opacity also serving as a surrogate for non-volatile and semivolatile HAP metals. Refer to section II.B of the proposal preamble (84 FR 48711, September 16, 2019) for additional information on the HAP emissions regulated by the NESHAP.

C. What changes did we propose for the Lime Manufacturing source category in our September 16, 2019, proposal?

On September 16, 2019, the EPA published a proposed rule in the **Federal Register** for the Lime Manufacturing Plants NESHAP, 40 CFR part 63, subpart AAAAA, that took into consideration the RTR analyses. In the proposed rule, we proposed:

- No revisions to the numerical emission limits based on the RTR;
- revisions to the SSM provisions of the NESHAP in order to ensure that they are consistent with the Court decision in *Sierra Club* v. *EPA,* 551 F. 3d 1019 (D.C. Cir. 2008), which vacated two provisions that exempted source owners and operators from the requirement to comply with otherwise applicable CAA section 112(d) emission standards during periods of SSM;

[1] The Court has affirmed this approach of implementing CAA section 112(f)(2)(A): *NRDC* v. *EPA,* 529 F.3d 1077, 1083 (D.C. Cir. 2008) (''If EPA determines that the existing technology-based standards provide an 'ample margin of safety,' then the Agency is free to readopt those standards during the residual risk rulemaking.'').

- a requirement for electronic submittal of notifications, semi-annual reports, and compliance reports (which includes performance test reports); and
- IBR of alternative test methods and references.

III. What is included in this final rule?

This action finalizes the EPA's determinations pursuant to the RTR provisions of CAA section 112 for the Lime Manufacturing source category. This action also finalizes other changes to the NESHAP, including revising the SSM provisions of the NESHAP; a requirement for electronic submittal of notifications, semi-annual reports, compliance reports, and performance test reports; adding an alternative test method to EPA Method 320; and IBR of alternative test methods and references to updated alternative test methods. This action also reflects several changes to the September 2019 proposal in consideration of comments received during the public comment period described in section IV of this preamble.

A. What are the final rule amendments based on the risk review for the Lime Manufacturing source category?

The EPA proposed no changes to 40 CFR part 63, subpart AAAAA NESHAP based on the risk review conducted pursuant to CAA section 112(f). In this action, we are finalizing our proposed determination that risks from the source category are acceptable, the standards provide an ample margin of safety to protect public health, and more stringent standards are not necessary to prevent an adverse environmental effect. The EPA received no new data or other information during the public comment period that causes us to change that proposed determination. Therefore, we are not making any revisions to the existing standards under CAA section 112(f), and we are readopting the existing standards.

B. What are the final rule amendments based on the technology review for the Lime Manufacturing source category?

We determined that there are no developments in practices, processes, and control technologies that necessitate revisions to the MACT standards for this source category. Therefore, we are not finalizing revisions to the MACT standards under CAA section 112(d)(6).

C. What are the final rule amendments addressing emissions during periods of SSM?

The EPA is finalizing, with some revisions, the proposed amendments to the Lime Manufacturing Plants NESHAP to remove and revise provisions related to SSM. In its 2008 decision in *Sierra Club* v. *EPA,* 551 F.3d 1019 (D.C. Cir. 2008), the Court vacated portions of two provisions in the EPA's CAA section 112 regulations governing the emissions of HAP during periods of SSM. Specifically, the Court vacated the SSM exemption contained in 40 CFR 63.6(f)(1) and (h)(1), holding that under section 302(k) of the CAA, emissions standards or limitations must be continuous in nature and that the SSM exemption violates the CAA's requirement that there must always be a CAA section 112 standard that applies. We are finalizing our proposal to eliminate the SSM exemption in this rule. As detailed in section IV.D of the proposal preamble (84 FR 48727, September 16, 2019), we proposed to require that the emission limitations apply at all times (see 40 CFR 63.7100(a)), consistent with the Court decision in *Sierra Club* v. *EPA,* 551 F. 3d 1019 (D.C. Cir. 2008).

We have also revised Table 8 to subpart AAAAA of part 63 (the General Provisions applicability table) in several respects, as is explained in more detail below in section IV.C. For example, we have eliminated the incorporation of the General Provisions' requirement that the source develops an SSM plan. We have also eliminated and revised certain recordkeeping and reporting that is related to the SSM exemption as described in detail in the proposal and summarized below in section IV.C. As discussed in the proposal preamble, these revisions are consistent with the requirement in 40 CFR 63.7100(a) that the standards apply at all times. Refer to section IV.C of this preamble for a detailed discussion of these amendments.

The EPA is finalizing standards for startup and shutdown that differ in some respects from the startup and shutdown standards that were proposed. Changes from the proposal to the standards for periods of startup and shutdown being finalized reflect the EPA's re-evaluation of appropriate startup and shutdown standards in light of public comments. The EPA's rationale for those changes is discussed in section IV.C. below.

The proposed definition of ''Startup'' has been revised by changing the wording from ''lime product'' to ''on-specification lime product'' and adding an alternate ending to startup. Commenters stated that the term ''lime product'' is not specific enough and that off-specification product is discharged almost simultaneously upon startup. In addition, the EPA is not finalizing the proposed work practices for periods of startup. For periods of startup, the EPA has instead established opacity emission limits for kilns equipped with FFs or ESPs. The EPA is not establishing different standards for kilns equipped with wet scrubbers during periods of startup and such kilns must comply with the same standard that apply at all other times. Also, during shutdown, kilns equipped with FFs, ESPs, or wet scrubbers must comply with the same standards that apply during normal operation. (See Table 2 of 40 CFR part 63, subpart AAAAA—Startup and Shutdown Emission Limits).

Further, the EPA is not finalizing different standards for malfunctions and sources must meet applicable standards during periods of malfunction. As discussed in the September 16, 2018, proposal preamble, the EPA interprets CAA section 112 as not requiring emissions that occur during periods of malfunction to be factored into development of CAA section 112 standards, although the EPA has the discretion to set standards for malfunctions where feasible. Refer to section IV.D of the proposal preamble for further discussion of the EPA's rationale for the decision not to set standards for malfunctions.

D. What other changes have been made to the NESHAP?

Consistent with the proposal, the EPA is finalizing the electronic reporting requirements, specifically that owners or operators of lime manufacturing plants submit electronic copies of required performance test reports, performance evaluation reports, and semiannual compliance reports through the EPA's Central Data Exchange (CDX) using the Compliance and Emissions Data Reporting Interface (CEDRI).

We are finalizing an alternative test method to EPA Method 320 and incorporating several test methods by reference, as discussed further in section IV.E of this preamble. We are also finalizing additional changes that address technical and editorial corrections, as proposed and as described in section IV.F of this preamble.

E. What are the effective and compliance dates of the standards?

The revisions to the MACT standards being promulgated in this action are effective on July 24, 2020. The compliance date for the revised requirements for affected sources that commenced construction or reconstruction on or before September 16, 2019, is January 20, 2021, with the exception of the vacated SSM exemptions contained in 40 CFR 63.6(f)(1) and (h)(1). We are revising

Table 9 of 40 CFR part 63, subpart AAAAA to clarify that for all affected sources, these exemptions do not apply given the court vacatur in *Sierra Club* v. *EPA,* 551 F. 3d 1019 (D.C. Cir. 2008). The compliance date for the revised requirements for affected sources that commence construction or reconstruction after September 16, 2019, is July 24, 2020 or upon initial startup, whichever is later. We are finalizing changes, as proposed, that would impact ongoing compliance requirements for 40 CFR part 63, subpart AAAAA. As discussed elsewhere in this preamble, we are finalizing the requirement that performance test results, performance evaluation reports, and the semiannual reports using the new template be submitted electronically. We are also finalizing changes to the requirements for SSM. For example, we are removing the exemption from the requirements to meet the standard during SSM periods and removing the requirement to develop and implement an SSM plan, as proposed. Our experience with similar industries that have been required to convert reporting mechanisms, install necessary hardware, install necessary software, become familiar with the process of submitting performance test results electronically through the EPA's CEDRI, test these new electronic submission capabilities, reliably employ electronic reporting, and convert logistics of reporting processes to different time-reporting parameters, shows that a time period of a minimum of 90 days, and more typically, 180 days, is generally necessary to successfully complete these changes. Our experience with similar industries further shows that this sort of regulated facility generally requires a time period of 180 days to read and understand the amended rule requirements; evaluate their operations to ensure that they can meet the required standards during periods of startup and shutdown as defined in the rule and make any necessary adjustments; adjust parameter monitoring and recording systems to accommodate revisions; and update their operations to reflect the revised requirements. The EPA recognizes the confusion that multiple different compliance dates for individual requirements would create and the additional burden such an assortment of dates would impose. From our assessment of the timeframe needed for compliance with the entirety of the revised requirements, the EPA considers a period of 180 days to be the most expeditious compliance period practicable, and, thus, is finalizing the requirement that existing affected sources be in compliance with all of this regulation's revised requirements within 180 days of the regulation's effective date.

IV. What is the rationale for our final decisions and amendments for the Lime Manufacturing source category?

For each issue, this section provides a description of what we proposed and what we are finalizing for the issue, the EPA's rationale for the final decisions and amendments, and a summary of key comments and responses. For all comments not discussed in this preamble, comment summaries and the EPA's responses can be found in the comment summary and response document available in the docket.

A. Residual Risk Review for the Lime Manufacturing Source Category

1. What did we propose pursuant to CAA section 112(f) for the Lime Manufacturing source category?

Pursuant to CAA section 112(f), the EPA conducted a risk review and presented the results for the review, along with our proposed decisions regarding risk acceptability and ample margin of safety, in the September 16, 2019, proposed rule for the Lime Manufacturing source category (84 FR 48708). The results of the risk assessment are presented briefly in Table 1 of this preamble and in the risk report titled *Residual Risk Assessment for the Lime Manufacturing Plants Source Category in Support of the 2019 Risk and Technology Review Proposed Rule,* and sections III and IV of the proposal preamble (84 FR 48708, September 16, 2019) available in the docket for this action.

TABLE 1—INHALATION RISK ASSESSMENT SUMMARY FOR LIME MANUFACTURING [1] SOURCE CATEGORY

Number of facilities [2]	Maximum individual cancer risk (in 1 million) [3] based on . . .		Population at increased risk of cancer ≥ 1-in-1 million based on . . .		Annual cancer incidence (cases per year) based on . . .		Maximum chronic noncancer TOSHI [4] based on . . .		Maximum screening acute noncancer HQ [5] based on actual emissions level
	Actual emissions level	Allowable emissions level	Actual emissions level	Allowable emissions level	Actual emissions level	Allowable emissions level	Actual emissions level	Allowable emissions level	
35	1	2	12	450	0.001	0.003	0.04	0.05	0.6 (REL)

[1] Based on actual and allowable emissions.
[2] Number of facilities evaluated in the risk assessment. Includes 35 operating facilities subject to 40 CFR part 63, subpart AAAAA.
[3] Maximum individual excess lifetime cancer risk due to HAP emissions from the source category.
[4] Maximum target organ-specific hazard index (TOSHI). The target organ with the highest TOSHI for the Lime Manufacturing source category is the respiratory system.
[5] The maximum estimated acute exposure concentration was divided by available short-term threshold values to develop an array of hazard quotient (HQ) values. The acute HQ shown was based upon the lowest acute 1-hour dose-response value, the recommended exposure limit (REL) for elemental mercury. When an HQ exceeds 1, we also show the HQ using the next lowest available acute dose-response value.

The results of the chronic inhalation cancer risk assessment, based on actual emissions, show the estimated maximum individual cancer risk (MIR) posed by the 35 facilities is 1-in-1 million, with metals, aldehydes, and organic HAP emissions from the lime kiln and cooler exhaust as the major contributors to the risk. The total estimated cancer incidence based on actual emission levels is 0.001 excess cancer cases per year, or one excess case every 1,000 years. About 12 people are estimated to have cancer risks greater than or equal to 1-in-1 million based on actual emissions from HAP emitted from the 35 facilities in this source category. The maximum chronic noncancer hazard index (HI) for the source category is estimated to be less than 1 (0.04) based on actual emissions of hydrochloric acid (HCl), nickel compounds, and acrolein emitted from lime kiln and cooler exhaust. No one is estimated to have a TOSHI greater than 1 based on actual emissions.

The EPA also evaluated the cancer risk at the maximum emissions allowed by the MACT standard, or ''MACT-allowable emissions.'' Risk results from the inhalation risk assessment using the MACT-allowable emissions indicate that the cancer MIR is 2-in-1 million with metals, aldehydes, and organic HAP emissions from lime kiln and cooler exhaust driving the risks, and that the maximum chronic noncancer TOSHI value is 0.05 with HCl, nickel compounds, and acrolein emissions from lime kiln and cooler exhaust driving the TOSHI. The total cancer incidence estimated based on allowable emissions from this source category is 0.003 excess cancer cases per year or one excess case every 333 years. Based on MACT-allowable emission rates, approximately 450 people are estimated to have cancer risks above 1-in-1 million. No people are estimated to have a noncancer HI above 1 based on allowable emissions.

For the Lime Manufacturing source category, the maximum acute HQ is 0.6 based on the REL, driven by actual emissions of elemental mercury. By definition, the acute REL represents a health-protective level of exposure, with effects not anticipated below those levels, even for repeated exposures.

We also conducted a multipathway screening assessment for the source category, and the results of the screening assessment are presented in the risk report titled *Residual Risk Assessment for the Lime Manufacturing Plants Source Category in Support of the 2019 Risk and Technology Review Proposed Rule,* and section IV of the proposal preamble (84 FR 48708, September 16, 2019) available in the docket for this action. A screening value is not an estimate of the cancer risk or a noncancer HQ (or HI). Rather, a screening value represents a high-end estimate of what the risk or HQ may be. For this source category the highest screening values were from mercury emissions, with a Tier 2 screening value of 5 and a Tier 3 screening value of 2 for this noncarcinogen. We are confident that if a refined multipathway risk assessment was conducted, the HQ for mercury would be lower than 2. Further details on the Tier 3 screening assessment can be found in Appendix 11 of *Residual Risk Assessment for the Lime Manufacturing Source Category in Support of the Risk and Technology Review 2019 Proposed Rule.* Dioxin and arsenic emissions resulted in a Tier 2 cancer screening value of 20, which means that we are confident that the multipathway cancer risk is lower than 20-in-1 million.

The EPA has determined that it is not necessary to go beyond the Tier 3 assessment for mercury (to a site-specific assessment) or beyond the Tier 2 cancer screening assessment. As explained above, the mercury screening value of 2 is a high-end estimate of what the risk or hazard may be and can be interpreted to mean that we are confident that the HQ would be lower than 2. Similarly, we are confident that the excess cancer risk is less than 20-in-1 million, and evaluation under Tier 3 or a site-specific assessment would further reduce the estimated risk. Further, risk results from four site-specific mercury assessments the EPA has conducted for four RTR source categories resulted in noncancer HQs that range from 50 times to 800 times lower than the respective Tier 2 mercury screening value for those facilities (refer to Docket ID No. EPA–HQ–OAR–2017–0015 for a copy of these reports).[2] Based on our review of these analyses, we expect if we were to perform a site-specific assessment for the Lime Manufacturing source category, the mercury HQ would be at least a one order of magnitude less than the Tier 2 non-cancer screening value for mercury. Thus, the EPA is confident that the mercury HQ would be less than 1, if further refined to incorporate enhanced site-specific analyses such as improved model boundary identification with improved soil/water run-off calculations and AERMOD deposition outputs used in the TRIM.FaTE model.

In evaluating the potential for multipathway effects from emissions of lead, the EPA compared modeled annual lead concentrations to the secondary National Ambient Air Quality Standards (NAAQS) level for lead (0.15 milligram per cubic meter (mg/m^3), arithmetic mean concentration over a 3-month period). The highest annual average lead concentration, 0.0007 mg/m^3, is far below the NAAQS level for lead, indicating a low potential for multipathway impacts.

The EPA also conducted an environmental risk screening assessment for the Lime Manufacturing source category for the following pollutants: Arsenic, cadmium, dioxins and furans (D/F), HCl, hydrogen fluoride (HF), lead, mercury (methyl mercury and mercuric chloride), and polycyclic organic matter (POM). In the Tier 1 screening analysis for HAP known to be persistent and bio-accumulative in the environment (PB–HAP) (other than lead, which was evaluated differently), arsenic, cadmium, and POM emissions had no exceedances of any of the ecological benchmarks evaluated. D/F emissions had a Tier 1 exceedance at 31 facilities for a surface soil benchmark by a maximum screening value of 30. Divalent mercury emissions had Tier 1 exceedances for the following benchmarks: Sediment threshold level (one facility), surface soil threshold level—plant communities (25 facilities), and surface soil threshold level—invertebrate communities (32 facilities) by a maximum screening value of 20. Methyl mercury emissions had Tier 1 exceedances for the following benchmarks: Fish (avian/piscivores) NOAEL—Merganser (one facility), surface soil no-observed-adverse-effect-level (NOAEL) for mammalian insectivores—shrew (13 facilities), and surface soil NOAEL for avian ground insectivores—woodcock (33 facilities) by a maximum screening value of 40. A Tier 2 screening analysis was performed for D/F, divalent mercury, and methyl mercury emissions. In the Tier 2 screening analysis, there were no exceedances of any of the ecological benchmarks evaluated for any of the pollutants. For lead, we did not estimate any exceedances of the secondary lead NAAQS. For HCl and HF, the average modeled concentration around each facility (*i.e.,* the average concentration of all off-site data points in the modeling domain) did not exceed any ecological benchmark. In addition, each individual modeled concentration of HCl and HF (*i.e.,* each off-site data point in the modeling domain) was below the ecological benchmarks for all facilities. Based on the results of the environmental risk screening analysis, we do not expect an adverse environmental effect as a result of HAP emissions from this source category.

An assessment of risk from facility-wide actual emissions was performed to provide context for the source category risks. The maximum lifetime individual cancer risk posed by the 35 facilities, based on facility-wide emissions, is 1-in-1 million (estimated for three facilities), with arsenic, chromium (VI) compounds, and nickel emissions from fugitive PSH operations driving the risk.

[2] EPA Docket records: Appendix 11 of the *Residual Risk Assessment for the Taconite Manufacturing Source Category in Support of the Risk and Technology Review 2019 Proposed Rule;* Appendix 11 of the *Residual Risk Assessment for the Integrated Iron and Steel Source Category in Support of the Risk and Technology Review 2019 Proposed Rule;* Appendix 11 of the *Residual Risk Assessment for the Portland Cement Manufacturing Source Category in Support of the 2018 Risk and Technology Review Final Rule;* and Appendix 11 of the *Residual Risk Assessment for the Coal and Oil-Fired EGU Source Category in Support of the 2018 Risk and Technology Review Proposed Rule.*

The total estimated cancer incidence from facility-wide emissions is 0.004 excess cancer cases per year, or one case in every 250 years. Approximately 30 people are estimated to have cancer risk equal to 1-in-1 million from facility-wide emissions. The maximum facility-wide chronic noncancer TOSHI is estimated to be less than 1 (0.4), mainly driven by emissions of HCl from a facility-wide fugitive area source.

To examine the potential for any environmental justice issues that might be associated with the source category, the EPA performed a demographic analysis, which is an assessment of risk to individual demographic groups of the populations living within 5 kilometers (km) and within 50 km of the facilities. The results of the Lime Manufacturing source category demographic analysis indicated that emissions from the source category expose approximately 12 people to a cancer risk at or above 1-in-1 million and no people to a chronic noncancer TOSHI greater than 1. The percentages of the at-risk population indicated that three of the 10 demographic groups (White, African American and people below the poverty level) that are living within 50 km of facilities in the source category exceeded the corresponding national percentage for the same demographic groups. The methodology and the results of the demographic analysis are presented in a technical report, *Risk and Technology Review—Analysis of Demographic Factors for Populations Living Near Lime Manufacturing Source Category Operations,* available in the docket for this action.

The EPA weighed all health risk factors in our risk acceptability determination, and we proposed that the residual risks from this source category are acceptable. We then considered whether the NESHAP provides an ample margin of safety to protect public health, and whether more stringent standards were necessary to prevent an adverse environmental effect, by taking into consideration costs, energy, safety, and other relevant factors. In determining whether the standards provide an ample margin of safety to protect public health, we examined the same risk factors that we investigated for our acceptability determination and also considered the costs, technological feasibility, and other relevant factors related to emissions control options that might reduce risk associated with emissions from the source category. We proposed that the 2004 Lime Manufacturing Plants NESHAP requirements provide an ample margin of safety to protect public health. Based on the results of our environmental risk screening assessment, we also proposed that more stringent standards are not necessary to prevent an adverse environmental effect.

2. How did the risk review change for the Lime Manufacturing source category?

Since proposal, neither the risk assessment nor our determinations regarding risk acceptability, ample margin of safety, or adverse environmental effects have changed.

3. What key comments did we receive on the risk review, and what are our responses?

Additional comments and our specific responses can be found in the comment summary and response document titled *Summary of Public Comments and Responses for Lime Manufacturing Plants Residual Risk and Technology Review,* which is available in the docket for this action. The EPA received comments in support of and opposed to the proposed risk review and our determination that no revisions were warranted under CAA section 112(f)(2). Key comments and responses are discussed below.

Comment: One commenter stated that there are substantial health threats from the lime manufacturing industry. The commenter stated that it is unlawful, arbitrary and capricious for the EPA to do nothing to reduce any of these emissions or resulting health threats from lime manufacturing. The commenter stated that the EPA may not lawfully or rationally find health risks to be ''acceptable'' under CAA section 112(f)(2) when the record shows the opposite, and the EPA has ignored significant health impacts. The commenter stated that the EPA's proposal is incomplete and based on analyses that underestimate and ignore the health risks from the toxic pollution that lime manufacturing facilities emit into communities.

Response: The EPA disagrees with the comment. Results of the EPA's risk assessment for the Lime Manufacturing source category indicate that both the actual and allowable inhalation cancer risks to the individual most exposed are less than or equal to 2-in-1 million, well below the presumptive limit of acceptability of 100-in-1 million. The actual and allowable inhalation noncancer risks to the individual most exposed are below a HQ of 1. Based on the conservative nature of the multipathway screens, we find the Tier 2 screening values (D/F and arsenic) for cancer and Tier 3 noncancer screening values (cadmium and mercury) acceptable for the Lime Manufacturing source category. This determination is based upon the upper-bound cancer screening values of 20 being significantly below an excess cancer risk of 100-in-1 million and on results from facility-specific assessments for mercury performed for other source categories. Based upon this experience, we conclude that if we were to conduct a site-specific risk assessment for the Lime Manufacturing source category, the risk would result in a HQ value of 1 or lower. For this reason and considering the conservative nature of the multipathway exposure screening scenario, no further analysis was performed. In our ample margin of safety analysis, we investigated available emissions control options that might reduce the risk from the source category. We considered this information along with all of the health risks and other health information considered in our determination of risk acceptability. As part of the proposed ample margin of safety analysis, we considered activated carbon injection (ACI) systems, which have not been used or demonstrated on lime kilns, for controlling D/F and mercury emissions. In both cases, considering the potential negligible reductions in emissions and the results of our risk analysis, we concluded that the use of ACI would have little effect on the source category risks. Due to the already low risk, along with the substantial costs associated with more stringent standards, we determined that additional emissions controls for this source category were not required to provide an ample margin of safety to protect public health. We have retained this determination in the final rule. We note that the commenter did not provide detail or supporting documentation for their comment.

Comment: A commenter urged the EPA to set stronger standards to bring further protection to communities from lime manufacturing facilities. The commenter requested that the EPA consider the people exposed to these facilities' emissions and affected by its proposed decision not to strengthen the emission limits. The commenter urged the EPA to exercise its legal authority to end unacceptable risk for exposed communities and set the ''ample margin of safety to protect public health'' and prevent an adverse environmental effect, instead of attempting to avoid the science and the health threats shown in the record.

Response: The risk assessment demonstrated that health risks due to air emissions from lime manufacturing sources are acceptable and after considering available control options

and all available risk information, the EPA concluded that the current standards provide an ample margin of safety to protect public health. These conclusions support the EPA's decision to not revise the existing emission limits. However, we have amended the final rule to make corrections to certain provisions and have amended provisions to clarify their intent and these revisions will result in improved monitoring and compliance with and implementation of the rule. In addition, the elimination of the SSM exemption may result in lower HAP emissions.

Comment: A commenter stated that the EPA underestimated the health threats to children and from early-life exposure by ignoring increased risk in childhood and from prenatal exposure.

Response: The EPA disagrees with the comment that the risk assessment for this source category does not consider the groups that may be most at-risk (*e.g.,* children). When the EPA derives exposure reference concentrations and unit risk estimates for metal HAP, it also considers the most sensitive populations identified in the available literature and, importantly, these are the values used in our risk assessments.

We acknowledge that population subgroups, including children, may have a potential for risk that is greater than the general population due to greater relative exposure and/or greater susceptibility to the toxicant. The assessments we undertake to estimate risk account for this potential vulnerability, for example; the EPA includes exposure from D/F through ingestion of breast-milk for infants less than 1 year of age. The EPA also estimates age-specific risks to account for the higher sensitivity of developing children to mutagens. With respect to inhalation exposure, the risk assessments we perform implicitly account for this greater potential for exposure by assuming lifetime exposure, in which populations are conservatively presumed to be exposed to airborne concentrations at their residence continuously, 24 hours per day for a full lifetime, including childhood. With regard to children's potentially greater susceptibility to noncancer toxicants, the assessments rely on the EPA's (or comparable) hazard identification and dose-response values that have been developed to be protective for all subgroups of the general population, including children.

For example, a review of the chronic reference value process concluded that the EPA's reference concentration (RfC) derivation processes adequately considered potential susceptibility of different subgroups with specific consideration of children, such that the resultant RfC values pertain to the full human population, ''including sensitive subgroups,'' a phrase which is inclusive of childhood.[3] With respect to cancer, the EPA uses the age-dependent adjustment factor approach referred to by the commenter but limits the use of those factors only to carcinogenic pollutants that are known to act via mutagenic mode of action (MOA), in contrast to the California Office of Environmental Health Hazard Assessment approach, which uses them across the board for all carcinogens regardless of MOA. In lieu of chemical-specific data on which age or life-stage specific risk estimates or potencies can be determined, default age dependent adjustment factors can be applied when assessing cancer risk for early-life exposures to chemicals that cause cancer through a mutagenic MOA. With regard to other carcinogenic pollutants for which early-life susceptibility data are lacking, it is the EPA's long-standing science policy position that use of the linear low-dose extrapolation approach (without further adjustment) provides adequate public health conservatism in the absence of chemical-specific data indicating differential early-life susceptibility or when the mode of action is not mutagenicity. The basis for this methodology is provided in the 2005 Supplemental Guidance.[4]

The estimated risks must be considered in the context of the full set of assumptions used for this risk assessment. Our unit risk estimates for HAP are considered a plausible upper-bound estimate with an appropriate age dependent adjustment; actual potency is likely to be lower and could be as low as zero. Our chronic noncancer reference values have been derived considering the potential susceptibility of different subgroups, with specific consideration of children.

Comment: One commenter stated that the EPA underestimated health threats to communities exposed to multiple sources by neglecting to add factors to account for the increased risks caused by such exposure. The commenter stated that the EPA underestimated the cancer, chronic noncancer, and acute health risks by using modeling assumptions that ignore real-world exposures, underestimating risk from chemicals such as benzene and lead due to the EPA's refusal to follow the best available science, and neglecting to aggregate cumulative risks.

Response: The EPA's chronic risk assessment modeling accounts for cumulative cancer risks from emitted carcinogens and for pollutants that have similar modes of action or (where this information is absent) that affect the same target organ, we aggregated the HQs. This process creates, for each target organ, a TOSHI, defined as the sum of HQs for individual HAP that affect the same organ or organ system.

The modeling conducted also includes the effects of multiple facilities that may be in close proximity when estimating concentration and risk impacts at each block centroid. When evaluating the risks associated with a particular source category, we combined the impacts of all facilities within the same source category and assessed chronic exposure and risk for all census blocks with at least one resident (*i.e.,* locations where people may reasonably be assumed to reside rather than receptor points at the fenceline of a facility). The MIR considers the combined impacts of all sources in the category that may be in close proximity. This approach is similar for those facilities within the source category that have an associated or cumulative impact on neighboring lakes as it relates to assessing multi-pathway impacts for each of the PB–HAP. Background risks or contributions to risk from sources outside the source category under review could be one of the relevant factors considered in the ample margin of safety determination, along with cost and economic factors, technological feasibility, and other factors. Background risks and contributions to risk from sources outside the facilities under review were not considered in the ample margin of safety determination for this source category, mainly because of the significant uncertainties associated with emissions estimates for such sources. Our approach here is consistent with the approach we took regarding this issue in the Hazardous Organic NESHAP (HON) RTR (71 FR 76603, December 21, 2006), which the Court upheld in the face of claims that the EPA had not adequately considered background (*NRDC* v. *EPA,* 529 F.3d 1077 (D.C. Cir. 2008)).

Comment: A commenter stated that the EPA has ignored all multipathway cancer and noncancer chronic health risks that result when persistent or bioaccumulative pollutants emitted by lime manufacturing facilities fall into the Great Lakes, bays, rivers, and other large waterbodies. The commenter

[3] USEPA, 1994. Methods for derivation of inhalation reference concentrations and application of inhalation dosimetry. EPA/600/8–90/066F; *https://www.epa.gov/sites/production/files/2014-11/documents/rfc_methodology.pdf.*

[4] USEPA, 2005b. Supplemental guidance for assessing early-life exposure to carcinogens. EPA/630/R–03003F. *https://www3.epa.gov/ttn/atw/childrens_supplement_final.pdf.*

stated that by excluding all impacts from deposition in these waterbodies, the EPA ignored both health threats and ecological threats, and violated its legal obligation to assess health and environmental risk and reduce these hazards as the statute directs.

Response: Very large lakes and bays (*i.e.,* those larger than 100,000 acres) are not considered because their large volumes significantly dilute air deposition from point sources. Such large lakes, including the Great Lakes, the Great Salt Lake, Lake Okeechobee, Lake Pontchartrain, Lake Champlain, Green Bay, and Galveston Bay also dilute contaminants in the vast biomass of fish in the large aquatic food webs. Contaminants derived from emissions to air by a point source would be distributed among populations of millions of fish resulting in negligible increases in fish tissue concentrations attributable to the point source. Also, very large lakes are rare (only 35 such lakes exist in the conterminous United States). Moreover, for facilities near large lakes, there usually are other, smaller lakes that the EPA does consider for which contaminant dilution would be lower, and, therefore, for which human health and ecological risks would be higher. Thus, the EPA does model exposure via fish consumption for populations that are near large lakes in a manner that generally will be more health protective than modeling the very large lake. The EPA also does not model lakes adjacent or connected to a river or saltwater body (estuaries and rivers) or bays; these waterbodies are likely to have high outflow with limited chemical retention. Less retention time for these types of waterbodies result in significantly lower media concentrations when compared to lakes.

4. What is the rationale for our final approach and final decisions for the risk review?

The EPA evaluated all of the comments on the EPA's risk review and determined that no changes to the review are needed. In the proposed rule, we proposed that the risks from the Lime Manufacturing source category are acceptable, the current standards provide an ample margin of safety to protect public health, and more stringent standards are not necessary to prevent an adverse environmental effect. For the reasons explained in the proposal and in our responses to public comments and pursuant to CAA section 112(f)(2), we are finalizing our risk review as proposed.

B. Technology Review for the Lime Manufacturing Source Category

1. What did we propose pursuant to CAA section 112(d)(6) for the Lime Manufacturing source category?

Pursuant to CAA section 112(d)(6), the EPA conducted a technology review, which focused on identifying and evaluating developments in practices, processes, and control technologies that would necessitate revision to the existing emission standards for the Lime Manufacturing source category. No cost-effective developments in practices, processes, or control technologies were identified in our technology review to necessitate revisions to the PM or opacity standards, which are both used as a surrogate for HAP metals, standards. More information concerning our technology review is in the memorandum titled *Technology Review for the Lime Manufacturing Source Category,* which is in the docket for this action, and in the preamble to the proposed rule (84 FR 48726).

2. How did the technology review change for the Lime Manufacturing source category?

The technology review has not changed since proposal.

3. What key comments did we receive on the technology review, and what are our responses?

The EPA received comments in support of the proposed determination from the technology review that no revisions were necessary under CAA section 112(d)(6). We also received comments asserting that the technology review was inadequate for a variety of reasons, primarily because of failure to consider control technologies for unregulated HAP emissions.

Comment: A commenter stated the EPA does not discuss or perform any review under CAA section 112(d)(6) for all emitted HAP. The commenter noted that the EPA failed to complete a technology review for HCl, mercury, D/F, and organic HAP. The commenter stated that the EPA cannot determine whether developments in pollution control make it ''necessary'' to revise the emission standards without determining what developments have occurred for these HAP. The commenter stated that the fact that these HAP are emitted from the source category requires the EPA to evaluate them pursuant the technology review.

Response: Section 112(d)(6) of the CAA requires the EPA to ''review and revise, as necessary (taking into account developments in practices, processes, and control technologies), emission standards promulgated under this section . . . .'' The EPA reads CAA section 112(d)(6) as a limited provision requiring the Agency to review the original emission standards already promulgated and to revise those standards as necessary, taking into account developments in practices, processes, and control technologies. Under this reading, section 112(d)(6) of the CAA does not impose upon the Agency any obligation to promulgate new emission standards or expand the scope of an existing regulation.[5] Accordingly, we disagree with the commenter that CAA section 112(d)(6) requires a technology review for HCl, mercury, D/F, and organic HAP. The EPA notes that we have completed our statutory requirements under CAA section 112(d)(6) in reference to the promulgated standards.

Any new MACT standards would not be established pursuant to CAA section 112(d)(6), but instead would be established under CAA sections 112(d)(2) and (3) or CAA section 112(h). Establishing emissions standards under CAA sections 112(d)(2) and (3) or 112(h) involves a different analytical approach than reviewing emissions standards under CAA section 112(d)(6).

Comment: One commenter stated that there are multiple HAP emitted from the Lime Manufacturing source category that have no numeric emission standards, including HCl, organic HAP (*e.g.,* formaldehyde, styrene), mercury, and D/F. The commenter stated that CAA section 112(d) requires limits for each HAP that a source category emits and that CAA section 112(d)(6) requires the EPA to review and revise its existing emission standards ''as necessary.'' The commenter stated that when the EPA reviewed the Lime Manufacturing source category and found that they lack emission limits for emitted HAP, it is necessary under CAA section 112(d)(6) to revise the standard (*i.e.,* set limits for these HAP). The commenter noted that the EPA's failure to set emission limits for these HAP causes public suffering from uncontrolled exposure to these HAP.

The commenter cited prior court rulings that found that the Agency has a ''clear statutory obligation to set emission standards for each listed HAP.'' [*National Lime Ass'n,* 233 F.3d

[5] On April 21, 2020, as the Agency was preparing the final rule for signature, a decision was issued in *LEAN* v. *EPA,* 955 F. 3d. 1088 (D.C. Cir. 2020) in which the Court held that the EPA has an obligation to set standards for unregulated pollutants as part of technology reviews under CAA section 112(d)(6). At the time of signature, the mandate in that case had not been issued and the EPA is continuing to evaluate the decision.

625, 634 (D.C. Cir. 2000) and *Sierra Club* v. *EPA,* 479 F.3d 875, 883 (D.C. Cir. 2007)] The commenter cited prior rulemakings where the EPA has acknowledged this issue and has subsequently set emission limits for pollutants without standards.

The commenter noted that the Lime Manufacturing Plants RTR clearly demonstrates that these pollutants are emitted from the source category, but that the EPA has not acknowledged its obligation to set limits on these uncontrolled HAP and has not explained why it is not ''necessary'' to revise the existing standards to set limits for these HAP. The commenter stated that the EPA has emissions data from at least some sources, and it must complete its obligation to set a limit for these HAP.

The commenter stated that it is unlawful and arbitrary for the EPA not to set limits for these HAP in this rulemaking. The commenter stated that if the EPA does not do this, it will fail to complete the review and revision rulemaking as CAA section 112(d)(6) requires, will violate the Court's order in *California Communities Against Toxics* v. *Pruitt,* 241 F. Supp. 3d 199 (D.C. 2017), and will also issue a final rule that is unlawful and inadequate.

Response: CAA section 112(d)(6) requires the EPA to review and revise, as necessary (taking into account developments in practices, processes, and control technologies), emission standards promulgated under this section. We do not read section CAA section 112(d)(6) as supporting the commenter's assertion that the EPA must establish new standards for unregulated emission points or pollutants as part of a technology review of the existing standards (but see footnote 5). The EPA reads CAA section 112(d)(6) as a limited provision requiring the Agency to, at least every 8 years, review the emission standards already promulgated in the NESHAP and to revise those standards as necessary taking into account developments in practices, processes, and control technologies. The EPA does not read CAA section 112(d)(6) as directing the Agency, as part of or in conjunction with the mandatory 8-year technology review, to develop new emission standards to address HAP or emission points for which standards were not previously promulgated.

When the EPA established standards for previously unregulated emissions, we did not establish those initial standards pursuant to CAA section 112(d)(6) but instead established the standards under one of the provisions that govern initial standard setting—CAA sections 112(d)(2) and (3) or, if the prerequisites are met, CAA sections 112(d)(4) or 112(h). Establishing emissions standards under these provisions of the CAA involves a different analytical approach from reviewing emissions standards under CAA section 112(d)(6).

Additional comments and our specific responses can be found in the comment summary and response document titled *Summary of Public Comments and Responses for Lime Manufacturing Plants Residual Risk and Technology Review,* which is available in the docket for this action.

4. What is the rationale for our final approach for the technology review?

The EPA evaluated all of the comments on the EPA's technology review and determined that no changes to the review are needed. For the reasons explained in the proposed rule, we determined that no cost-effective developments in practices, processes, or control technologies were identified in our technology review to necessitate revisions to the standards. More information concerning our technology review can be found in the memorandum titled *Technology Review for the Lime Manufacturing Source* Category, which is in the docket for this action. Therefore, pursuant to CAA section 112(d)(6), we are finalizing our technology review as proposed.

C. SSM for the Lime Manufacturing Source Category

1. What did we propose for the Lime Manufacturing source category?

The EPA proposed amendments to the Lime Manufacturing Plants NESHAP to remove and revise provisions related to SSM that are not consistent with the requirement that the standards apply at all times or that are unnecessary or redundant in the absence of an SSM exemption. More information concerning the elimination of SSM provisions is in the preamble to the proposed rule (84 FR 48708, September 16, 2019).

2. How did the SSM provisions change from proposal for the Lime Manufacturing source category?

The EPA is finalizing the SSM provisions with the following changes from the proposal:

- Replacing the proposed startup work practice standards for kilns and coolers equipped with a FF or ESP with opacity emission standards.
- Replacing the proposed startup work practice standards for kilns and coolers equipped with a wet scrubber with a requirement to meet standards applicable during normal operation.
- Revising the definition of ''Startup'' to add ''on-specification'' prior to ''lime product'' and to add an alternate ending to startup.
- Adding testing requirements for determining when lime product is deemed on-specification.

With respect to the revisions to the proposed startup standards, the EPA is finalizing standards for startup that differ from what we proposed based on a re-evaluation of the need for work practice standards. The EPA proposed work practice standards for kilns equipped with wet scrubbers, FFs, and ESPs. However, the final rule requires kilns and coolers that are equipped with ESPs or FFs to meet numerical opacity limits and kilns and coolers equipped with wet scrubbers to meet the scrubbing liquid flow rate requirements that apply during normal operations. The EPA's determination in the proposed rule (84 FR 48727) that work practice standards were appropriate was based on a finding that the application of measurement methodology for PM emissions was impracticable because the test methods required for compliance are to be conducted under steady-state conditions which are difficult to achieve during startup. In addition to the reference test method (EPA Method 5), we considered PM emission monitors, which also requires steady-state conditions. However, based on comments claiming that the EPA has not shown a lack of practicable measurement methodology for startup periods, we reconsidered the issue. The 2004 final NESHAP rule established opacity as an emission standard limiting PM emissions. We are not aware of factors that would prevent the monitoring of opacity during startup periods.

For kilns equipped with FFs or ESPs, 40 CFR part 63, subpart AAAAA allows compliance with opacity standards to ensure PM is controlled between stack tests.[6] In this rule, for periods of startup, the EPA is requiring kilns equipped with FFs or ESPs to meet the 15-percent opacity limit that applies during normal operation averaged over the period of startup. The EPA has determined that a longer averaging time is appropriate for startup periods since we are aware that emissions during startup can be variable in light of the sequence of events that

[6] The EPA notes that under 40 CFR part 63, subpart AAAAA stack testing is not permitted during startup and shutdown. As proposed, this rule replaces the reference in Table 9 to 40 CFR 63.7(e)(1) (which prohibits performance testing during periods of startup and shutdown) with identical language at 40 CFR 63.7112(c)).

occur during startup of a kiln. Thus, the longer averaging time being finalized is to account for this variability that could result in spikes in opacity during the startup period. During startup, even the best performing units are constantly making adjustments in terms of fuel flow and combustion air flow rate. Every increase in fuel rate or feed rate requires the source to adjust air flow to the proper level. Each adjustment can lead to a spike in opacity. Accounting for such variability in setting emission standards is consistent with the CAA case law. *See, United States Sugar Corp.* v. *EPA,* 830 F.3d 579, 632 (D.C. Cir. 2016) (''We have held, see *Mossville Envtl. Action Now* v. *EPA,* 370 F.3d 1232, 1242 (D.C. Cir. 2004), and recently reaffirmed, see *NACWA,* 734 F.3d at 1133–34, that the EPA can consider this variability when setting MACT floors.''). As proposed, the EPA is not establishing different shutdown standards for kilns equipped wth FFs or wet scrubbers and, thus, such kilns must meet otherwise applicable limits during shutdown.

3. What key comments did we receive on the SSM provisions, and what are our responses?

The EPA received 16 comments related to our proposed revisions to the SSM provisions. Commenters generally supported the proposed removal of the SSM exemptions but disagreed with either the proposing of work practice standards for the startup period or certain aspects of the proposed work practice standards. We evaluated the comments and determined that changes to the proposed SSM provisions are warranted. A summary of these comments and our responses are located in the memorandum titled *Summary of Public Comments and Responses for Lime Manufacturing Plants Residual Risk and Technology Review,* which is in the docket for this action.

Comment: Commenters stated that the EPA's work practice standard requiring all kilns to start and operate on ''clean fuels'' until the kiln reaches a temperature of 1200 degrees Fahrenheit is unnecessary, not based on information in the administrative record, inconsistent with processes required to safely and properly commence kiln operation, and, for some kilns, is impractical based on the realities of operating kilns in the lime industry.

The commenters stated that for operational and safety reasons, electrostatic precipitators (ESP) cannot be started immediately to effectively remove PM upon startup of the kiln. Therefore, the clean fuel work practice for startup makes sense for ESP-equipped kilns. The commenters confirmed that the limited number of ESP-equipped kilns in the lime industry can be started on natural gas or other listed clean fuels.

The commenters stated that for baghouse and scrubber-equipped kilns, clean fuel startup is not needed because the air pollution control device is operating at the beginning of startup and begins removing PM immediately. The commenters stated that since stone feed rates are low during startup, total PM emissions exiting the kiln will be less than during normal operation, and the operating air pollution control devices will ensure that PM will be removed. The commenters also noted that clean fuels are not available at all lime manufacturing locations (for example, natural gas is not readily available in areas far from gas pipelines).

The commenters stated that the proposed requirement to meet the opacity and scrubber liquid flow rate operating limits is sufficient to show that emissions are not excessive for baghouse and scrubber-equipped kilns. The commenters recommended that the EPA delete the requirement for baghouse and scrubber-equipped kilns to start on clean fuels but add a requirement that the air pollution control devices for such kilns be in operation at the beginning of startup.

Response: The EPA agrees that the requirement to start and operate on ''clean fuels'' is unnecessary for kilns equipped with FFs or wet scrubbers because the control devices can be operational at the time of startup. Therefore, we are not finalizing the work practice requirement to startup on clean fuel for kilns equipped for FFs or wet scrubbers. As explained above in section C.2, we are instead requiring kilns equipped with FFs, ESPs or wet scrubbers to comply with standards as described in section C.2 above and in Table 2 during startup and shutdown.

Comment: The proposed definition of the end of startup was ''Startup ends 60 minutes after the lime kiln generates lime product.'' Commenters stated that the term ''lime product'' is not specific enough to provide certainty to regulated sources. The commenters highlighted that a kiln will start to discharge off-spec product almost simultaneously with the lighting of the primary fuel. The commenters stated that it can take up to 12 hours to produce quality grade lime following first discharge from a rotary kiln, and even longer for a vertical kiln.

The commenters recommended that the end of startup should be related to levels of stone feed, because the applicable PM emissions limits are based on tons of stone feed. The commenters recommended that the definition of the end of startup should be revised to read ''Startup ends 60 minutes after stone feed reaches planned production quantities.''

Response: The EPA appreciates the commenters feedback regarding the definition of the end of startup. Commenters provided further information (Docket ID Item No. EPA–HQ–OAR–2017–0015–0015, *SSM Letter from Industry (1/31/2019))* regarding what constitutes on-specification lime product and the time when on-specification lime product is produced. Commenters note that on-specification lime is produced when steady-state conditions are achieved. The EPA determined that the definition of the end of startup is the time when steady-state conditions are achieved such that PM testing could be conducted with the reference test method. We have determined that these steady-state conditions are achieved either when first producing on-specification lime product or 12 hours following first discharge from the kiln, whichever is earlier.

We are finalizing the definition of the end of startup to provide more clarity, as follows: ''*Startup ends when the lime kiln generates on-specification lime product or 12 hours following first discharge from the lime kiln, whichever is earlier.*'' We are also finalizing a new definition for on-specification lime product, as follows: ''*On-specification lime product means lime product that has been sufficiently calcined to meet end use requirements.*''

Finally, we are finalizing a requirement for facilities to test hourly during startup to determine when lime product meets the definition of on-specification, to maintain records of the time the kiln first began producing on-specification lime product, and the time of first discharge from the lime kiln.

Comment: Commenters stated that the best way to address malfunction events would be for plants to develop site-specific protocols for malfunctions that would be embodied in a rule required plan, and that compliance with those protocols would constitute compliance with an applicable work practice standard. The commenters suggested retaining the requirement for a SSM plan that would contain these protocols, or requiring them in the plant's operations, maintenance, and monitoring (OM&M) plan.

The commenters stated that this would allow work practices for malfunctions to be tailored to the specific equipment and operating conditions present at each plant, and

the presence of the protocols in a required plan would allow for the EPA review and enforcement. The commenters stated that the EPA's consideration of work practice standards for specified malfunctions (84 FR 48728) would be better than not setting separate standards at all, but that this approach would omit some malfunctions, and will not have the same degree of ''fit'' as tailored OM&M protocols would have.

The commenters stated that adopting work practice standards for specified malfunctions (as opposed to tailored OM&M protocols) could also cause confusion as to what malfunctions are covered by the regulation. The commenters summarized the definition of malfunction in 40 CFR 63.2. The commenters noted that not all operational malfunctions of kilns and their associated air pollution control and monitoring equipment constitute ''malfunctions'' under the definition in section 63.2, because some problems do not have the potential to cause emissions limitations to be exceeded.

The commenters stated that local engineering expertise may be required to determine whether particular operational malfunctions are ''malfunctions'' under the statute and rule and that this is a reason why tailored procedures in OM&M plans would be preferable to work practice standards for specified malfunctions.

Response: The EPA does not agree with the commenter that malfunctions should be addressed through source-specific enforceable ''plans'' that would contain these protocols for malfunctions. Establishing source-specific protocols for malfunctions that met MACT stringency requirements would be difficult, if not impossible, given the myriad different types of malfunctions that can occur. *See, U.S. Sugar Corp.* v. *EPA,* 830 F.3d 579, 608 (2016)(''Any possible standard is likely to be hopelessly generic to govern such a wide array of circumstances.'')

The EPA is also not finalizing specific work practice standards for specific malfunction events, although we may do so if available information supports separate MACT-compliant standards in the future. In this case, we received comment and information on potential work practice standards during periods of malfunction, however we do not have information to support that the suggested standards met the MACT stringency requirements. The EPA also agrees that finalizing specific work practice standards for malfunctions has the potential to omit certain malfunction events and cause confusion regarding what malfunctions are covered by the regulation, as it would be difficult to capture all malfunction events.

Comment: A commenter stated support for the EPA's proposed removal of the existing exemption of emissions during SSM periods. The commenter stated that the CAA requires that standards are continuous and applicable at all times and referenced various court rulings upholding this determination.

The commenter stated that the EPA may not finalize the new SSM exemptions it has proposed. The commenter stated that the EPA has not cited and can cite no statutory language granting it authority or ''discretion'' to set such standards, because it has none. The commenter stated that the EPA has only the discretion provided by the Act and delegated by Congress. [*Clean Air Council* v. *Pruitt,* 862 F.3d 1, 9 (DC Cir. 2017)] The commenter stated that relevant statutory language denies, rather than gives, the EPA authority to set malfunction-based standards or exemptions. See 42 U.S.C. 7412(d), (h), and 7602(k).

Response: The EPA disagrees that it has proposed new SSM exemptions or that the EPA does not have authority to establish different standards for periods of startup, shutdown or malfunction. In fact, the EPA proposed to (1) eliminate the SSM exemption, (2) require compliance with the existing standard for periods of malfunction and (3) require compliance with standards during periods of startup and shutdown. The commenter does not explain and cannot support the general claim that the statutory language denies the EPA authority to set different standards for startup or shutdown. The 2008 decision in *Sierra Club* v. *EPA,* 551 F.3d 1019 (DC Cir. 2008) (''2008 Sierra Club decision''), held that emissions standards or limitations must be continuous in nature and that ''some'' section 112 standards apply continuously. The DC Circuit reiterated this principle in *Sierra Club* v *EPA,* 884 F. 3d. 1185, 1203 (DC Cir. 2018) (''2018 Sierra Club decision'') explaining that the 2014 Sierra Club decision ''held that, whenever HAP sources are in operation, including during startup and shutdown, the EPA must continuously subject them to either numeric limits or Section 112(h)-compliant work practice standards.'' Consistent with the 2008 Sierra Club decision, and taking into account startup and shutdown periods, the EPA proposed work practice standards for these periods based on a determination under CAA section 112(h) that for kilns and coolers it was not feasible to prescribe or enforce a numeric standard during these periods of startup and shutdown. See 84 FR 48727. As discussed in the preamble to the final rule, based on public comments, we have made changes from the proposal to the standards for periods of startup and shutdown.

Comment: One commenter stated that the EPA does not have statutory authority to create work practice requirements for startups. The commenter summarized the requirements and applicable definitions of CAA sections 7412(h)(1) and (h)(2) and stated that the EPA has not satisfied either of the statute's definitions of ''not feasible to prescribe or enforce and emission standard.'' The commenter stated that promulgating work practice requirements instead of numeric emission limitations for periods of startup would violate the statute. The commenter stated that CAA section 112(h)(2)(B) covers situations where ''the application of measurement methodology to a particular class of sources is not practicable due to technological and economic limitations.'' The commenter stated that startup and shutdown are ''events,'' not a ''particular class of source.'' The commenter stated that section 112(h)(2)(B) cannot be used as justification for work practice standards in lieu of numeric emission limits.

Response: As discussed above, based on public comments, we have made changes from the proposal to the standards for periods of startup and shutdown. The EPA's final rule does not establish work practice standards for period of startup and shutdown, so the comment is no longer relevant. However, the EPA notes that it does not agree with the commenter that section 112(h)(2)(B) can be invoked to justify a work practice standard only for categories or subcategories of sources under section 112(h)(2)(B), not for periods of operation. Section 112(h) provides that the EPA may ''promulgate a design, equipment, work practice, or operational standard, or combination thereof'' in lieu of a numeric emission standard if the Administrator determines that it is not feasible, in his/her judgment, to prescribe or enforce a numeric standard. More specifically, section 112(h)(2) states it is infeasible to prescribe or enforce an emission standard if the application of measurement methodology to a particular class of sources is not practicable due to technological and economic limitations. Nothing in this section limits the Agency's discretion to establish work practice standards to particular sources, subcategories of sources, or source categories, or to certain periods of operations if, in the

Administrator's judgment, it is not feasible to prescribe or enforce a numeric emission standard during those periods. The reference to ''a particular class of sources'' in section 112(h)(2) does not limit the EPA's authority to determine, for a category or subcategory of sources, that it is infeasible to prescribe or enforce an emission standard for those sources during certain identifiable time periods, such as startup and shutdown.

Comment: A commenter stated that the EPA has proposed to excuse sources from using their ESPs during startup. The commenter stated that the EPA argues that industry stakeholders have claimed it may be unsafe to run ESPs during these times. The commenter stated that CAA section 112(h)(2)(B) does not authorize the EPA to set work practice requirements based on the Agency's views about the safety implications of running a particular control device.

The commenter stated that nothing in the CAA or existing rule requires lime kilns to control their PM emissions with ESPs. The commenter stated that if lime kiln owners and operators believe it is unsafe to run ESPs during startup and shutdown, the appropriate solution is for them to deploy other control devices (*e.g.,* FFs), not to excuse them from meeting numeric emission limits during these events.

Response: As discussed above, based on public comments, we have made changes from the proposal to the standards for periods of startup and shutdown. The EPA's final rule does not establish work practice standards for period of startup and shutdown so the comment is no longer relevant.

4. What is the rationale for our final approach for the SSM provisions?

We evaluated all comments on the EPA's proposed amendments to the SSM provisions. For the reasons explained in the proposed rule, we determined that it is appropriate to remove and revise provisions related to SSM that are not consistent with the requirement that the standards apply at all times or that are unnecessary or redundant in the absence of an SSM exemption. Therefore, we are finalizing our approach for the SSM provisions as proposed with changes as detailed in section IV.C.2 of this preamble. More information concerning the amendments we are finalizing for SSM is discussed above and in the preamble to the proposed rule (84 FR 48727–48730, September 16, 2019).

D. Electronic Reporting Requirements for the Lime Manufacturing Source Category

1. What did we proposed for the Lime Manufacturing source category?

The EPA proposed that owners or operators of lime manufacturing plants submit electronic copies of required performance test reports, performance evaluation reports, and semiannual compliance reports through the EPA's CDX using the CEDRI. More information concerning our proposal on electronic reporting requirements can be found in the proposed rule (84 FR 48708).

2. How did the electronic reporting provisions change for the Lime Manufacturing source category?

Since proposal, the electronic reporting provisions have not changed.

3. What key comments did we receive on the electronic reporting provisions, and what are our responses?

The EPA received comments related to the proposed electronic reporting provisions. The commenters generally supported the proposed provisions but disagreed with certain aspects of the provisions.

Comment: Commenters provided feedback on the electronic semiannual compliance report (spreadsheet template), per the EPA's request (84 FR 48730). The commenters noted the following:

- In tab ''CMS Deviation Summary,'' column D (Total Source Operating Time (hours)), and column F (Total Duration of CMS Downtime as a percentage of Total Emissions Unit Operating Time) are both protected so it is not possible for an operator to input this data. This should be corrected.
- The example source operating time is shown as 6,240 hours. For semi-annual reporting, the maximum possible hours are 4,380.

The commenters stated that the EPA should compare the final template reporting form to the final rule to ensure each reporting element is required in the rule and that the template reporting form instructions are accurate and detailed enough to ensure consistent reporting across the industry.

Response: The EPA will check the final reporting template to be sure each reporting requirement marked as a required element is required by the final rule and will also provide adequate instructions for filling out the reporting template. The EPA will also check to be sure columns D (operating time) and F are unprotected in order that manual inputs can be entered by the user. The example operating time for semi-annual reporting will be updated to 4,380 hours.

Comment: One commenter stated that the EPA may not create an unlawful exemption or extension for compliance reporting as it proposes to do for web outages or so-called ''*force majeure* events,'' as this violates the requirement for standards to be continuous and would allow unreported exceedances to go unchecked, indefinitely.

Response: The commenter asserts that the brief case-by-case extension of report submittal deadlines is an unlawful exemption from compliance with the emissions standards. This is not the case. The EPA notes that there is no exemption to reporting, much less an exemption from compliance with the emission standards, only a method for requesting an extension of the reporting deadline. Reporters are required to justify their request and identify a reporting date. While no new fixed duration deadline is set, the regulation does require that the report be submitted electronically as soon as possible after the CEDRI outage is resolved or after the *force majeure* event occurs. The Administrator may even request that the report be sent in hardcopy until electronic reporting can be resumed.

The Administrator has full discretion to accept or reject the claim of a CEDRI system outage or *force majeure.* As such, an extension is not automatic and is agreed to on an individual basis by the Administrator. If the Administrator determines that a facility has not acted in good faith to reasonably report in a timely manner, the Administrator can reject the claim and find that the failure to report timely is a deviation from the regulation.

The EPA also disagrees that the ability to request a reporting extension violates the requirement for emissions standards to be continuous. While reporting is an important mechanism for the EPA and air agencies to assess whether owners or operators are in compliance with emissions standards, reporting obligations are separate from (*i.e.,* in addition to) requirements that an owner or operator be in compliance with an emissions standard. The EPA has discretion to establish reporting schedules, and also discretion to allow a mechanism for extension of those schedules on a case-by-case basis.

Additional comments and our specific responses can be found in the comment summary and response document titled *Summary of Public Comments and Responses for Lime Manufacturing Plants Residual Risk and Technology Review,* which is available in the docket for this action.

4. What is the rational for our final approach for the electronic reporting provisions?

The EPA evaluated all of the comments on the EPA's proposed amendments to the electronic reporting provisions. For the reasons explained in the proposed rule (84 FR 48708), we have determined the electronic submittal of the reports addressed in this final rulemaking will:

- Increase the usefulness of the data contained in those reports;
- be consistent with current trends in data availability and transparency;
- further assist in the protection of public health and the environment;
- improve compliance by facilitating the ability of regulated facilities to demonstrate compliance with requirements;
- facilitate the ability of delegated state, local, tribal, and territorial air agencies and the EPA to assess and determine compliance; and
- ultimately reduce burden on regulated facilities, delegated air agencies, and the EPA.

Electronic reporting also eliminates paper-based, manual processes, thereby saving time and resources, simplifying data entry, eliminating redundancies, minimizing data reporting errors, and providing data quickly and accurately to the affected facilities, air agencies, the EPA, and the public. Moreover, electronic reporting is consistent with the EPA's plan [7] to implement Executive Order 13563 and is in keeping with the EPA's Agency-wide policy [8] developed in response to the White House's Digital Government Strategy.[9] For more information on the benefits of electronic reporting, see the memorandum titled *Electronic Reporting Requirements for New Source Performance Standards (NSPS) and National Emission Standards for Hazardous Air Pollutants (NESHAP) Rules,* available in Docket ID No. EPA–HQ–OAR–2017–0015.

E. IBR

In accordance with the requirements of 1 CFR 51.5, the EPA will incorporate by reference the following documents described in the amendments to 40 CFR 63.14:

- ANSI/ASME PTC 19.10–1981, Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus], issued August 31, 1981, IBR approved for table 5 to subpart AAAAA. This method is approved as an alternative to EPA Method 3B of appendix A to part 60.
- ASTM D6348–03 (Reapproved 2010), Standard Test Method for Determination of Gaseous Compounds by Extractive Direct Interface Fourier Transform Infrared (FTIR) Spectroscopy, including Annexes A1 through A8, Approved October 1, 2010, IBR approved for 40 CFR 63.7142(a) and 63.7142(b). This method is approved as an alternative to EPA Method 320 of appendix A to part 63.
- ASTM D6348–12e1, Standard Test Method for Determination of Gaseous Compounds by Extractive Direct Interface Fourier Transform Infrared (FTIR) Spectroscopy, Approved February 1, 2012, IBR approved for 40 CFR 63.7142(a) and 40 CFR 63.7142(b). This method is approved as an alternative to EPA Method 320 of appendix A to part 63.
- ASTM D6735–01 (Reapproved 2009), Standard Test Method for Measurement of Gaseous Chlorides and Fluorides from Mineral Calcining Exhaust Sources—Impinger Method, IBR approved for 40 CFR 63.7142(a). This method is approved as an alternative to EPA Method 321 of appendix A to part 63.
- ASTM D6420–99 (Reapproved 2010), Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry, Approved October 1, 2010, IBR approved for 40 CFR 63.7142(b). This method is approved as an alternative to EPA Method 18 of appendix A to part 60.
- EPA–454/R–98–015, Office of Air Quality Planning and Standards (OAQPS), Fabric Filter Bag Leak Detection Guidance, September 1997, IBR approved for 40 CFR 63.7113(d). This method was added in accordance with final revisions to the bag leak detection requirements under 40 CFR 63.7113(d).

The ANSI/ASME document is available from the American Society of Mechanical Engineers (ASME) at *http://www.asme.org;* by mail at Two Park Avenue, New York, NY 10016–5990; or by telephone at (800) 843–2763. The ASTM documents are available from the American Society for Testing and Materials (ASTM) at *https://www.astm.org;* by mail at l00 Barr Harbor Drive, P.O. Box C700, West Conshohocken, PA 19428–2959; or by telephone at (610) 832–9500. The EPA has made, and will continue to make, the EPA document generally available electronically through *https://www.regulations.gov/* and at the EPA Docket Center (see the **ADDRESSES** section of this preamble for more information).

F. Technical and Editorial Changes for the Lime Manufacturing Source Category

1. What did we propose for the Lime Manufacturing source category?

The EPA proposed the following technical and editorial changes:

- Revising the monitoring requirements in 40 CFR 63.7113 to the provision that triboelectric bag leak detection system must be installed, calibrated, operated, and maintained according to EPA–454/R–98–015. *Fabric Filter Bag Leak Detection Guidance;*
- revising 40 CFR 63.7142 to add an alternative test method to EPA Method 320;
- revising 40 CFR.7142 to add the latest version of ASTM Method D6735–01;
- revising 40 CFR.7142 to add the latest version of ASTM Method D6420–99; and
- revising Table 4 to 40 CFR part 63, subpart AAAAA, to add alternative compliance option.

2. How did the technical and editorial changes change for the Lime Manufacturing source category?

Since proposal, the technical and editorial changes have not changed.

3. What key comments did we received on the technical and editorial changes, and what are our responses?

No comments were received on the technical and editorial changes detailed above.

4. What is the rationale for our final approach for the technical and editorial changes?

Because no comments were received on the technical and editorial changes that the EPA proposed, we determined that these changes should be finalized as proposed.

V. Summary of Cost, Environmental, and Economic Impacts and Additional Analyses Conducted

A. What are the affected facilities?

There are currently 35 lime manufacturing facilities operating in the United States that are subject to the Lime Manufacturing Plants NESHAP. The 40 CFR part 63, subpart AAAAA,

affected source is the lime kiln and its associated cooler, and the PSH operation system located at a major source of HAP emissions. A new or reconstructed affected source is a source that commenced construction after December 20, 2002, or meets the definition of reconstruction and commenced reconstruction after December 20, 2002.

B. What are the air quality impacts?

At the current level of control, emissions of total HAP are estimated to be approximately 2,320 tpy. This represents a reduction in HAP emissions of about 240 tpy due to the current (2004) Lime Manufacturing Plants NESHAP. The final amendments will require all affected sources subject to the emission standards in the Lime Manufacturing Plants NESHAP to operate without the SSM exemption. We were unable to quantify the specific emissions reduction associated with eliminating the SSM exemption. However, eliminating the SSM exemption will reduce emissions by requiring facilities to meet emissions standards during SSM periods.

Indirect or secondary air emissions impacts are impacts that would result from the increased electricity usage associated with the operation of control devices (*i.e.,* increased secondary emissions of criteria pollutants from power plants). Energy impacts consist of the electricity and steam needed to operate control devices and other equipment that would be required under this proposed rule. The EPA expects no secondary air emissions impacts or energy impacts from this rulemaking.

C. What are the cost impacts?

The 35 lime manufacturing plants that would be subject to the final amendments would incur minimal net costs to meet revised recordkeeping and reporting requirements and the standards for periods of startup and shutdown. Nationwide costs associated with the final requirements are estimated to be $15,271. The EPA believes that the lime manufacturing plants which are subject to the NESHAP can meet the final requirements with minimal additional capital or operational costs. Each facility will experience costs to read and understand the rule amendments. Costs associated with the elimination of the SSM exemption were estimated as part of the reporting and recordkeeping costs and include time for re-evaluating previously developed SSM record systems. Costs associated with the requirement to electronically submit notifications and semi-annual compliance reports using CEDRI were estimated as part of the reporting and recordkeeping costs and include time for becoming familiar with CEDRI and the reporting template for semi-annual compliance reports.

D. What are the economic impacts?

Economic impact analyses focus on changes in market prices and output levels. If changes in market prices and output levels in the primary markets are significant enough, impacts on other markets may also be examined. Both the magnitude of costs needed to comply with a final rule and the distribution of these costs among affected facilities can have a role in determining how the market will change in response to a final rule. The total costs associated with reviewing the final rule, meeting the revised recordkeeping and reporting requirements, and complying with the revised final standards are estimated to be $15,271. This is an estimated cost of $266 to $2,925 per facility, depending on the number of lime kilns operated and the type of controls installed. These costs are not expected to result in a significant market impact, regardless of whether they are passed on to the purchaser or absorbed by the firms. Based on the costs associated with the elimination of the SSM exemption and the costs associated with the requirement to electronically submit compliance reports, we do not anticipate any significant economic impacts from these final amendments.

E. What are the benefits?

Although the EPA is unable to quantify reductions in HAP emissions as a result of the final amendments, we believe that the action improves the rule. Specifically, the final amendments remove SSM exemptions such that standards apply at all times. Additionally, the final amendments requiring electronic submittal of initial notifications, initial startup reports, annual compliance certifications, deviation reports, and performance test results will increase the usefulness of the data, is in keeping with current trends of data availability, will further assist in the protection of public health and the environment, and will ultimately result in less burden on the regulated community.

F. What analysis of environmental justice did we conduct?

The EPA believes that this action does not have disproportionately high and adverse human health or environmental effects on minority populations, low-income populations and/or indigenous peoples, as specified in Executive Order 12898 (59 FR 7629, February 16, 1994).

The documentation for this decision is contained in the *Risk and Technology Review Analysis of Demographic Factors for Populations Living Near Lime Manufacturing Source Category Operations,* which is available in the docket for this action. The results of the Lime Manufacturing source category demographic analysis indicated that emissions from the source category expose approximately 12 people to a cancer risk at or above 1-in-1 million and no people to a chronic noncancer TOSHI greater than 1. The percentages of the at-risk population indicate that three of the 10 demographic groups (White, African American and people below the poverty level) that are living within 50 km of facilities in the source category exceed the corresponding national percentage for the same demographic groups.

G. What analysis of children's environmental health did we conduct?

The EPA does not believe the environmental health or safety risks addressed by this action present a disproportionate risk to children. This action's health and risk assessments are contained in the *Residual Risk Assessment for the Lime Manufacturing Source Category in Support of the 2019 Risk and Technology Review Proposed Rule,* which is available in the docket for this action.

VI. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at *https://www2.epa.gov/laws-regulations/laws-and-executive-orders.*

A. Executive Orders 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is not a significant regulatory action and was, therefore, not submitted to the Office of Management and Budget (OMB) for review.

B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs

This action is not an Executive Order 13771 regulatory action because this action is not significant under Executive Order 12866.

C. Paperwork Reduction Act (PRA)

The information collection activities in this final rule have been submitted for approval to OMB under the PRA. The Information Collection Request (ICR) document that the EPA prepared

has been assigned EPA ICR number 2072.09. You can find a copy of the ICR in the docket for this rule, and it is briefly summarized here. The information collection requirements are not enforceable until OMB approves them.

We are finalizing changes to the reporting and recordkeeping requirements for the Lime Manufacturing Plants NESHAP in the form of eliminating the SSM reporting and SSM plan requirements and requiring electronic submittal of all compliance reports (including performance test reports). Any information submitted to the Agency for which a claim of confidentiality is made will be safeguarded according to the Agency policies set forth in title 40, chapter 1, part 2, subpart B—Confidentiality of Business Information (see 40 CFR part 2; 41 FR 36902, September 1, 1976; amended by 43 FR 40000, September 8, 1978; 43 FR 42251, September 20, 1978; 44 FR 17674, March 23, 1979).

Respondents/affected entities: Owners or operators of lime manufacturing plants that are major sources, or that are located at, or are part of, major sources of HAP emissions, unless the lime manufacturing plant is located at a kraft pulp mill, soda pulp mill, sulfite pulp mill, sugar beet manufacturing plant, or only processes sludge containing calcium carbonate from water softening processes.

Respondent's obligation to respond: Mandatory (40 CFR part 63, subpart AAAAA).

Estimated number of respondents: On average over the next 3 years, approximately 36 existing major sources will be subject to these standards. It is also estimated that one additional respondent will become subject to the emission standards over the 3-year period.

Frequency of response: The frequency of responses varies depending on the burden item.

Total estimated burden: The average annual burden to industry over the next 3 years from these recordkeeping and reporting requirements is estimated to be 9,690 hours (per year). Burden is defined at 5 CFR 1320.3(b).

Total estimated cost: The annual recordkeeping and reporting cost for all facilities to comply with all of the requirements in the NESHAP is estimated to be $1,810,000 (per year), of which $15,271 (first year) is for this rule, and the rest is for other costs related to continued compliance with the NESHAP including $684,000 in annualized capital and operation and maintenance costs.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations in 40 CFR are listed in 40 CFR part 9. When OMB approves this ICR, the Agency will announce that approval in the **Federal Register** and publish a technical amendment to 40 CFR part 9 to display the OMB control number for the approved information collection activities contained in this final rule.

D. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. In making this determination, the impact of concern is any significant adverse economic impact on small entities. This action only eliminates the SSM exemption, revises other SSM related requirements, and adds electronic reporting. None of the changes will impact the small entities. The rule removes the SSM exemption and establishes emission standard for startup and shutdown. Based on the controls used at the small entities, they will not be impacted by the alternate emission standards. Thus, this action will not impose any requirements on small entities.

E. Unfunded Mandates Reform Act (UMRA)

This action does not contain any unfunded mandate as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. While this action creates an enforceable duty on the private sector, the cost does not exceed $100 million or more.

F. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications as specified in Executive Order 13175. The EPA does not know of any lime manufacturing facilities owned or operated by Indian tribal governments. Thus, Executive Order 13175 does not apply to this action.

H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

This action is not subject to Executive Order 13045 because it is not economically significant as defined in Executive Order 12866, and because the EPA does not believe the environmental health or safety risks addressed by this action present a disproportionate risk to children. This action's health and risk assessments are contained in sections III and IV of the proposal preamble (84 FR 48708, September 16, 2019) and further documented in the risk report titled *Residual Risk Assessment for the Lime Manufacturing Source Category in Support of the 2019 Risk and Technology Review Proposed Rule,* which is available in the docket for this action.

I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This action is not subject to Executive Order 13211, because it is not a significant regulatory action under Executive Order 12866.

J. National Technology Transfer and Advancement Act (NTTAA) and 1 CFR Part 51

This action involves technical standards. The EPA has decided to use ANSI/ASME PTC 19.10–1981 Part 10 (2010), ''Flue and Exhaust Gas Analyses,'' as an acceptable alternative to EPA Method 3B manual portion only and not the instrumental portion. This method determines quantitatively the gaseous constituents of exhausts resulting from stationary combustion sources. This standard may be obtained from *https://www.asme.org* or from the American Society of Mechanical Engineers (ASME) at Three Park Avenue, New York, New York 10016–5990.

The EPA has decided to use ASTM D6348–03(2010) and ASTM D6348–12e1, ''Determination of Gaseous Compounds by Executive Direct Interface Fourier Transform (FTIR) Spectroscopy,'' as alternatives to using EPA Method 320 under certain conditions and incorporate these alternatives by reference. ASTM D6348–03(2010) was previously determined equivalent to EPA Method 320 with caveats. ASTM D6348–12e1 is a revised version of ASTM D6348–03(2010) and includes a new section on accepting the results from direct measurement of a certified spike gas cylinder, but still lacks the caveats we placed on the ASTM D6348–03(2010) version. The

voluntary consensus standard (VCS), ASTM D6348–12e1, ''Determination of Gaseous Compounds by Extractive Direct Interface Fourier Transform (FTIR) Spectroscopy,'' is an acceptable alternative to EPA Method 320 at this time with caveats requiring inclusion of selected annexes to the standard as mandatory. When using ASTM D6348–12e1, the conditions that must be met are defined in 40 CFR 63.7142(a)(2). This field test method employs an extractive sampling system to direct stationary source effluent to an FTIR spectrometer for the identification and quantification of gaseous compounds. The ASTM D6348–03(2010) and ASTM D6348–12el standards were developed and adopted by the American Society for Testing and Materials (ATSM).

The EPA has also decided to use ASTM D6735–01 (Reapproved 2009), ''Standard Test Method for Measurement of Gaseous Chlorides and Fluorides from Mineral Calcining Exhaust Sources Impinger Method,'' as an alternative to EPA Method 321 provided that the provisions in 40 CFR 63.7142(a)(4) are followed. The EPA used ASTM D6735–01 for the determination of HCl in EPA Methods 26, 26A, and 321 from mineral calcining exhaust sources. This method will measure the gaseous HCl and other gaseous chlorides and fluorides that pass through a PM filter. The ASTM D6735–01 standard was developed and adopted by the ASTM.

The EPA has decided to use VCS ASTM D6420–99 (Reapproved 2010), ''Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography/Mass Spectrometry'' as an alternative to EPA Method 18 only when the target compounds are all known, and the target compounds are all listed in ASTM D6420 as measurable. ASTM D6420 should not be used for methane and ethane because atomic mass is less than 35. ASTM D6420 should never be specified as a total volatile organic compound method. This field method determines the mass concentration of volatile organic HAP.

The ASTM standards may be obtained from *http://www.astm.org* or from the ASTM at 100 Barr Harbor Drive, Post Office C700, West Conshohocken, Pennsylvania 19428–2959.

The EPA has decided to use EPA–454/R–98–015, Office of Air Quality Planning and Standards (OAQPS), Fabric Filter Bag Leak Detection Guidance, September 1997 as guidance for how a triboelectric bag leak detection system must be installed, calibrated, operated, and maintained. This document includes FF and monitoring system descriptions; guidance on monitor selection, installation, set up, adjustment, and operation; and quality assurance procedures. This document may be obtained from *http://www.epa.gov* or from the EPA, 1200 Pennsylvania Avenue NW, Washington, DC 20460.

While the EPA has identified another 10 VCS as being potentially applicable to this proposed rule, we have decided not to use these VCS in this rulemaking. The use of these VCS would not be practical due to lack of equivalency, documentation, validation date, and other import technical and policy considerations. See the memorandum titled *Voluntary Consensus Standard Results for NESHAP: Lime Manufacturing Residual Risk and Technology Review,* in the docket for this proposed rule for the reasons for these determinations.

Under 40 CFR 63.7(f) and 40 CFR 63.8(f) of subpart A of the General Provisions, a source may apply to the EPA for permission to use alternative test methods or alternative monitoring requirements in place of any required testing methods, performance specifications, or procedures in the final rule or any amendments.

K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes that this action does not have disproportionately high and adverse human health or environmental effects on minority populations, low-income populations, and/or indigenous peoples, as specified in Executive Order 12898 (59 FR 7629, February 16, 1994).

The documentation for this decision is contained in section IV.B of the proposal preamble and the technical report, *Risk and Technology Review Analysis of Demographic Factors for Populations Living Near Lime Manufacturing Source Category Operations,* which is available in the docket for this action.

L. Congressional Review Act (CRA)

This action is subject to the CRA, and the EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action is not a ''major rule'' as defined by 5 U.S.C. 804(2).

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedures, Air pollution control, Hazardous substances, Incorporation by reference, Lime manufacturing, Intergovernmental relations, Reporting and recordkeeping requirements.

Andrew Wheeler,

Administrator.

For the reasons set forth in the preamble, the EPA amends 40 CFR part 63 as follows:

PART 63—NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart A—General Provisions

■ 2. Section 63.14 is amended by revising paragraphs (e)(1), (h)(85), (86), (93), (100), and (n)(3) to read as follows:

§ 63.14 Incorporations by reference.

* * * * *

(e) * * *

(1) ANSI/ASME PTC 19.10–1981, Flue and Exhaust Gas Analyses [Part 10, Instruments and Apparatus], issued August 31, 1981, IBR approved for §§ 63.309(k), 63.457(k), 63.772(e) and (h), 63.865(b), 63.997(e), 63.1282(d) and (g), 63.1625(b), table 5 to subpart EEEE, 63.3166(a), 63.3360(e), 63.3545(a), 63.3555(a), 63.4166(a), 63.4362(a), 63.4766(a), 63.4965(a), 63.5160(d), table 4 to subpart UUUU, table 3 to subpart YYYY, 63.7822(b), 63.7824(e), 63.7825(b), 63.9307(c), 63.9323(a), 63.11148(e), 63.11155(e), 63.11162(f), 63.11163(g), 63.11410(j), 63.11551(a), 63.11646(a), and 63.11945, table 5 to subpart AAAAA, table 5 to subpart DDDDD, table 4 to subpart JJJJJ, table 4 to subpart KKKKK, tables 4 and 5 of subpart UUUUU, table 1 to subpart ZZZZZ, and table 4 to subpart JJJJJJ.

* * * * *

Subpart AAAAA—[Amended]

■ 3. Section 63.7083 is amended by revising paragraphs (a)(1), (2), and (b) and by adding paragraph (e) to read as follows:

§ 63.7083 When do I have to comply with this subpart?

(a) * * *

(1) If you start up your affected source before January 5, 2004, you must comply with the emission limitations no later than January 5, 2004, and you must have completed all applicable performance tests no later than July 5, 2004, except as noted in paragraphs (e)(1) and (2) of this section.

(2) If you start up your affected source after January 5, 2004, then you must comply with the emission limitations for new affected sources upon startup of your affected source and you must have completed all applicable performance tests no later than 180 days after startup, except as noted in paragraphs (e)(1) and (2) of this section.

(b) If you have an existing affected source, you must comply with the applicable emission limitations for the existing affected source, and you must have completed all applicable performance tests no later than January 5, 2007, except as noted in paragraphs (e)(1) and (2) of this section.

* * * * *

(e)(1) If your affected source commenced construction or reconstruction on or before September, 16, 2019, then the compliance date for the revised requirements promulgated at §§ 63.7090, 63.7100, 63.7112, 63.7113, 63.7121, 63.7130, 63.7131, 63.7132, 63.7140, 63.7141, 63.7142, and 63.7143 and Tables 2, 3, 4, 5, 7, 8 and 9 (except changes to the cross references to 63.6(f)(1) and (h)(1)) of 40 CFR 63, subpart AAAAA, published on July 24, 2020 is January 20, 2021.

(2) If your affected source commenced construction or reconstruction after September 16, 2019, then the compliance date for the revised requirements promulgated at §§ 63.7090, 63.7100, 63.7112, 63.7113, 63.7121, 63.7130, 63.7131, 63.7132, 63.7140, 63.7141, 63.7142, and 63.7143 and Tables 2, 3, 4, 5, 7, 8 and 9 to this subpart, published on July 24, 2020 is July 24, 2020 or the date of initial startup, whichever is later.

■ 4. Section 63.7090 is amended by revising paragraph (b) and adding paragraph (c) to read as follows:

§ 63.7090 What emission limitations must I meet?

* * * * *

(b) You must meet each operating limit in Table 3 to this subpart that applies to you.

(c) On or after the relevant compliance date for your source as specified in §§ 63.7083(e), you must meet each startup and shutdown period emission limit in Table 2 to this subpart that applies to you.

■ 5. Section 63.7100 is amended by revising paragraphs (a), (b), (c), (d)(3), (d)(4)(iii), (d)(6) introductory text, and (e) to read as follows:

§ 63.7100 What are my general requirements for complying with this subpart?

(a) Prior to the relevant compliance date for your source as specified in § 63.7083(e), you must be in compliance with the emission limitations (including operating limits) in this subpart at all times, except during periods of startup, shutdown, and malfunction. On and after the relevant compliance date for your source as specified in § 63.7083(e), you must be in compliance with the applicable emission limitations (including operating limits) at all times.

(b) Prior to the relevant compliance date for your source as specified in § 63.7083(e), you must be in compliance with the opacity and visible emission (VE) limits in this subpart at all times, except during periods of startup, shutdown, and malfunction. On and after the relevant compliance date for your source as specified in § 63.7083(e), you must be in compliance with the applicable opacity and VE limits at all times.

(c) Prior to the relevant compliance date for your source as specified in § 63.7083(e), you must always operate and maintain your affected source, including air pollution control and monitoring equipment, according to the provisions in § 63.6(e)(1)(i). On and after the relevant compliance date for your source as specified in § 63.7083(e), you must always operate and maintain any affected source, including associated air pollution control equipment and monitoring equipment, in a manner consistent with safety and good air pollution control practices for minimizing emissions. The general duty to minimize emissions does not require the owner or operator to make any further efforts to reduce emissions if levels required by the applicable standard have been achieved. Determination of whether such operation and maintenance procedures are being used will be based on information available to the Administrator which may include, but is not limited to, monitoring results, review of operation and maintenance procedures, review of operation and maintenance records, and inspection of the source.

(d) * * *

(3) Procedures for the proper operation and maintenance of each emission unit and each air pollution control device used to meet the applicable emission limitations and operating limits in Tables 1, 2 and 3 to this subpart, respectively. On and after the relevant compliance date for your source as specified in § 63.7083(e), your OM&M plan must address periods of startup and shutdown.

(4) * * *

(iii) Prior to the relevant compliance date for your source as specified in § 63.7083(e), ongoing operation and maintenance procedures in accordance with the general requirements of §§ 63.8(c)(1)(i) and (ii), (3), and (4)(ii). On and after the relevant compliance date for your source as specified in § 63.7083(e), ongoing operation and maintenance procedures in accordance with the general requirements of paragraph (c) of this section and §§ 63.8(c)(1)(ii), (3), and (4)(ii); and

* * * * *

(6) Corrective actions to be taken when process or operating parameters or add-on control device parameters deviate from the operating limits

specified in Table 3 to this subpart, including:

* * * * *

(e) Prior to the relevant compliance date for your source as specified in § 63.7083(e), you must develop a written startup, shutdown, and malfunction plan (SSMP) according to the provisions in § 63.6(e)(3).

■ 6. Section 63.7110 is amended by revising paragraphs (d) and (e) to read as follows:

§ 63.7110 By what date must I conduct performance tests and other initial compliance demonstrations?

* * * * *

(d) For each initial compliance requirement in Table 4 to this subpart that applies to you where the monitoring averaging period is 3 hours, the 3-hour period for demonstrating continuous compliance for emission units within existing affected sources at LMP begins at 12:01 a.m. on the compliance date for existing affected sources, that is, the day following completion of the initial compliance demonstration, and ends at 3:01 a.m. on the same day.

(e) For each initial compliance requirement in Table 4 to this subpart that applies to you where the monitoring averaging period is 3 hours, the 3-hour period for demonstrating continuous compliance for emission units within new or reconstructed affected sources at LMP begins at 12:01 a.m. on the day following completion of the initial compliance demonstration, as required in paragraphs (b) and (c) of this section, and ends at 3:01 a.m. on the same day.

■ 7. Section 63.7112 is amended by revising paragraphs (a), (b), (c), (j) introductory text, (k) introductory text, (k)(3), and (l) introductory text, and adding paragraph (m) to read as follows:

§ 63.7112 What performance tests, design evaluations, and other procedures must I use?

(a) You must conduct each performance test in Table 5 to this subpart that applies to you.

(b) Prior to the relevant compliance date for your source as specified in § 63.7083(e), each performance test must be conducted according to the requirements in § 63.7(e)(1) and under the specific conditions specified in Table 5 to this subpart. On and after the relevant compliance date for your source as specified in § 63.7083(e), each performance test must be conducted based on representative performance (*i.e.,* performance based on normal operating conditions) of the affected source and under the specific conditions in Table 5 to this subpart. Representative conditions exclude periods of startup and shutdown. The owner or operator may not conduct performance tests during periods of malfunction. The owner or operator must record the process information that is necessary to document operating conditions during the test and include in such record an explanation to support that such conditions represent normal operation. Upon request, the owner or operator shall make available to the Administrator such records as may be necessary to determine the conditions of performance tests.

(c) Prior to the relevant compliance date for your source as specified in § 63.7083(e), you may not conduct performance tests during periods of startup, shutdown, or malfunction, as specified in § 63.7(e)(1). On and after the relevant compliance date for your source as specified in § 63.7083(e), you may not conduct performance tests during periods of startup, shutdown, or malfunction, as specified in paragraph (b) of this section.

* * * * *

(j) You must establish any applicable 3-hour block average operating limit indicated in Table 3 to this subpart according to the applicable requirements in Table 4 to this subpart and paragraphs (j)(1) through (4) of this section.

* * * * *

(k) For each building enclosing any PSH operations that is subject to a VE limit, you must conduct a VE check according to item 18 in Table 5 to this subpart, and in accordance with paragraphs (k)(1) through (3) of this section.

* * * * *

(3) The observer conducting the VE checks need not be certified to conduct EPA Method 9 in appendix A–4 to part 60 of this chapter. However, the observer must meet the training requirements as described in EPA Method 22 in appendix A–7 to part 60 of this chapter.

(l) When determining compliance with the opacity standards for fugitive emissions from PSH operations in item 8 of Table 1 to this subpart, you must conduct EPA Method 9 in appendix A–4 to part 60 of this chapter according to item 17 in Table 5 to this subpart, and in accordance with paragraphs (l)(1) through (3) of this section.

* * * * *

(m) On and after the relevant compliance date for your source as specified in § 63.7083(e), during startup, kilns must be tested hourly to determine when lime product meets the definition of on-specification lime product.

■ 8. Section 63.7113 is amended by revising paragraphs (d) and (f) to read as follows:

§ 63.7113 What are my monitoring installation, operation, and maintenance requirements?

* * * * *

(d) For each bag leak detection system (BLDS), you must meet any applicable requirements in paragraphs (a)(1) through (5) and (d)(1) through (10) of this section.

(1) The BLDS must be certified by the manufacturer to be capable of detecting PM emissions at concentrations of 10 milligrams per actual cubic meter (0.0044 grains per actual cubic foot) or less.

(2) The sensor on the BLDS must provide output of relative PM emissions.

(3) The BLDS must be equipped with a device to continuously record the output signal from the sensor.

(4) The BLDS must have an alarm that will sound automatically when it detects an increase in relative PM emissions greater than a preset level.

(5) The alarm must be located in an area where appropriate plant personnel will be able to hear it.

(6) For a positive-pressure fabric filter (FF), each compartment or cell must have a bag leak detector (BLD). For a negative-pressure or induced-air FF, the BLD must be installed downstream of the FF. If multiple BLD are required (for either type of FF), the detectors may share the system instrumentation and alarm.

(7) Each triboelectric BLDS must be installed, calibrated, operated, and maintained according to EPA–454/R–98–015, ''Fabric Filter Bag Leak Detection Guidance,'' (incorporated by reference—see § 63.14). Other types of bag leak detection systems must be installed, operated, calibrated, and maintained according to the manufacturer's written specifications and recommendations. Standard operating procedures must be incorporated into the OM&M plan.

(8) At a minimum, initial adjustment of the system must consist of establishing the baseline output in both of the following ways, according to section 5.0 of the EPA–454/R–98–015, ''Fabric Filter Bag Leak Detection Guidance,'' (incorporated by reference—see § 63.14):

(i) Adjust the range and the averaging period of the device.

(ii) Establish the alarm set points and the alarm delay time.

(9) After initial adjustment, the sensitivity or range, averaging period,

alarm set points, or alarm delay time may not be adjusted except as specified in the OM&M plan required by § 63.7100(d). In no event may the range be increased by more than 100 percent or decreased by more than 50 percent over a 365-day period unless such adjustment follows a complete FF inspection that demonstrates that the FF is in good operating condition, as defined in section 5.2 of the ''Fabric Filter Bag Leak Detection Guidance,'' (incorporated by reference—see § 63.14). Record each adjustment.

(10) Record the results of each inspection, calibration, and validation check.

* * * * *

(f) For each emission unit equipped with an add-on air pollution control device, you must inspect each capture/collection and closed vent system at least once each calendar year to ensure that each system is operating in accordance with the operating requirements in item 6 of Table 3 to this subpart and record the results of each inspection.

* * * * *

■ 9. Section 63.7114 is amended by revising paragraphs (a) introductory text and (b) to read as follows:

§ 63.7114 How do I demonstrate initial compliance with the emission limitations standard?

(a) You must demonstrate initial compliance with each emission limit in Table 1 to this subpart that applies to you, according to Table 4 to this subpart. For existing lime kilns and their associated coolers, you may perform VE measurements in accordance with EPA Method 9 of appendix A to part 60 in lieu of installing a COMS or PM detector if any of the conditions in paragraphs (a)(1) through (3) of this section exist:

* * * * *

(b) You must establish each site-specific operating limit in Table 3 to this subpart that applies to you according to the requirements in § 63.7112(j) and Table 5 to this subpart. Alternative parameters may be monitored if approval is obtained according to the procedures in § 63.8(f).

* * * * *

■ 10. Section 63.7120 is amended by revising paragraph (c) introductory text to read as follows and removing paragraph (c)(3).

§ 63.7120 How do I monitor and collect data to demonstrate continuous compliance?

* * * * *

(c) Data recorded during the conditions described in paragraphs (c)(1) and (2) of this section may not be used either in data averages or calculations of emission or operating limits; or in fulfilling a minimum data availability requirement. You must use all the data collected during all other periods in assessing the operation of the control device and associated control system.

* * * * *

■ 11. Section 63.7121 is amended by revising paragraphs (a), (b), (d), (e) introductory text, and (e)(3) to read as follows:

§ 63.7121 How do I demonstrate continuous compliance with the emission limitations standard?

(a) You must demonstrate continuous compliance with each emission limitation in Tables 1 and 3 to this subpart that applies to you according to the methods specified in Tables 6 and 7 to this subpart.

(b) You must report each instance in which you did not meet each operating limit, opacity limit, and VE limit in Tables 2, 3 and 7 to this subpart that applies to you. These deviations must be reported according to the requirements in § 63.7131.

* * * * *

(d) Prior to the relevant compliance date for your source as specified in § 63.7083(e), consistent with §§ 63.6(e) and 63.7(e)(1), deviations that occur during a period of startup, shutdown, or malfunction are not violations if you demonstrate to the Administrator's satisfaction that you were operating in accordance with § 63.6(e)(1). The Administrator will determine whether deviations that occur during a period of startup, shutdown, or malfunction are violations, according to the provisions in § 63.6(e).

(e) For each PSH operation subject to an opacity limit as specified in Table 1 to this subpart, and any vents from buildings subject to an opacity limit, you must conduct a VE check according to item 1 in Table 7 to this subpart, and as follows:

* * * * *

(3) The observer conducting the VE checks need not be certified to conduct EPA Method 9 in appendix A–4 to part 60 of this chapter but must meet the training requirements as described in EPA Method 22 of appendix A–7 to part 60 of this chapter.

* * * * *

■ 12. Section 63.7130 is amended by revising paragraph (e) to read as follows:

§ 63.7130 What notifications must I submit and when?

* * * * *

(e) If you are required to conduct a performance test, design evaluation, opacity observation, VE observation, or other initial compliance demonstration as specified in Table 4 or 5 to this subpart, you must submit a Notification of Compliance Status according to § 63.9(h)(2)(ii). Beginning on the relevant compliance date for your source as specified in § 63.7083(e), submit all subsequent Notification of Compliance Status following the procedure specified in § 63.7131(h).

(1) For each initial compliance demonstration required in Table 4 to this subpart that does not include a performance test, you must submit the Notification of Compliance Status before the close of business on the 30th calendar day following the completion of the initial compliance demonstration.

(2) For each compliance demonstration required in Table 6 to this subpart that includes a performance test conducted according to the requirements in Table 5 to this subpart, you must submit the Notification of Compliance Status, including the performance test results, before the close of business on the 60th calendar day following the completion of the performance test according to § 63.10(d)(2).

■ 13. Section 63.7131 is amended by:
■ a. Revising paragraphs (a) and paragraph (b) introductory text;
■ b. Adding paragraph (b)(6);
■ c. Revising paragraphs (c)(4), paragraphs (d), (e) introductory text, and (e)(2);
■ d. Adding paragraph (e)(12);
■ e. Revising paragraph (f); and
■ f. Adding paragraphs (g) through (j).

The revisions and additions read as follows:

§ 63.7131 What reports must I submit and when?

(a) You must submit each report listed in Table 8 to this subpart that applies to you.

(b) Unless the Administrator has approved a different schedule for submission of reports under § 63.10(a), you must submit each report by the date specified in Table 8 to this subpart and according to the requirements in paragraphs (b)(1) through (6) of this section:

* * * * *

(6) Beginning on the relevant compliance date for your source as specified in § 63.7083(e), submit all subsequent compliance reports following the procedure specified in paragraph (h) of this section.

(c) * * *

(4) Prior to the relevant compliance date for your source as specified in

§ 63.7083(e), if you had a startup, shutdown or malfunction during the reporting period and you took actions consistent with your SSMP, the compliance report must include the information in § 63.10(d)(5)(i).

* * * * *

(d) For each deviation from an emission limitation (emission limit, operating limit, opacity limit, and VE limit) that occurs at an affected source where you are not using a CMS to comply with the emission limitations in this subpart, the compliance report must contain the information specified in paragraphs (c)(1) through (4) and (d)(1) and (2) of this section. The deviations must be reported in accordance with the requirements in § 63.10(d) prior to the relevant compliance date for your source as specified in § 63.7083(e) and the requirements in § 63.10(d)(1)–(4) beginning on the relevant compliance date for your source as specified in § 63.7083(e).

(1) The total operating time of each emission unit during the reporting period.

(2) Information on the number, duration, and cause of deviations (including unknown cause, if applicable), and the corrective action taken.

(3) An estimate of the quantity of each regulated pollutant emitted over a particulate matter emission limit, and a description of the method used to estimate the emissions.

(e) For each deviation from an emission limitation (emission limit, operating limit, opacity limit, and VE limit) occurring at an affected source where you are using a CMS to comply with the emission limitation in this subpart, you must include the information specified in paragraphs (c)(1) through (4) and (e)(1) through (11) of this section, except that beginning on the relevant compliance date for your source as specified in 63.7083(e), the semiannual compliance report must also include the information included in paragraph (e)(12) of this section. This includes periods of startup, shutdown, and malfunction.

* * * * *

(2) The date, time, and duration that each CMS was inoperative, except for zero (low-level) and high-level checks.

* * * * *

(12) An estimate of the quantity of each regulated pollutant emitted over a particulate matter emission limit, and a description of the method used to estimate the emissions.

(f) Each facility that has obtained a title V operating permit pursuant to part 70 or part 71 of this chapter must report all deviations as defined in this subpart in the semiannual monitoring report required by § 70.6(a)(3)(iii)(A) or 71.6(a)(3)(iii)(A) of this chapter. If you submit a compliance report specified in Table 8 to this subpart along with, or as part of, the semiannual monitoring report required by § 70.6(a)(3)(iii)(A) or 71.6(a)(3)(iii)(A) of this chapter, and the compliance report includes all required information concerning deviations from any emission limitation (including any operating limit), submission of the compliance report shall be deemed to satisfy any obligation to report the same deviations in the semiannual monitoring report. However, submission of a compliance report shall not otherwise affect any obligation you may have to report deviations from permit requirements to the permit authority.

(g) If you are required to submit reports following the procedure specified in this paragraph, you must submit reports to the EPA via the Compliance and Emissions Data Reporting Interface (CEDRI), which can be accessed through the EPA's Central Data Exchange (CDX) (*https://cdx.epa.gov/*). You must use the appropriate electronic report template on the CEDRI website (*https://www.epa.gov/electronic-reporting-air-emissions/compliance-and-emissions-data-reporting-interface-cedri*) for this subpart. The date report templates become available will be listed on the CEDRI website. The report must be submitted by the deadline specified in this subpart, regardless of the method in which the report is submitted. If you claim some of the information required to be submitted via CEDRI is confidential business information (CBI), submit a complete report, including information claimed to be CBI, to the EPA. The report must be generated using the appropriate form on the CEDRI website. Submit the file on a compact disc, flash drive, or other commonly used electronic storage medium and clearly mark the medium as CBI. Mail the electronic medium to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404–02, 4930 Old Page Rd., Durham, NC 27703. The same file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described earlier in this paragraph.

(h) Within 60 days after the date of completing each performance test required by this subpart, you must submit the results of the performance test following the procedures specified in paragraphs (h)(1) through (3) of this section.

(1) *Data collected using test methods supported by the EPA's Electronic Reporting Tool (ERT) as listed on the EPA's ERT website (https://www.epa.gov/electronic-reporting-air-emissions/electronic-reporting-tool-ert) at the time of the test.* Submit the results of the performance test to the EPA via CEDRI, which can be accessed through the EPA's CDX (*https://cdx.epa.gov/*). The data must be submitted in a file format generated through the use of the EPA's ERT. Alternatively, you may submit an electronic file consistent with the extensible markup language (XML) schema listed on the EPA's ERT website.

(2) *Data collected using test methods that are not supported by the EPA's ERT as listed on the EPA's ERT website at the time of the test.* The results of the performance test must be included as an attachment in the ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT website. Submit the ERT generated package or alternative file to the EPA via CEDRI.

(3) *Confidential business information (CBI).* If you claim some of the information submitted under paragraph (i) of this section is CBI, you must submit a complete file, including information claimed to be CBI, to the EPA. The file must be generated through the use of the EPA's ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT website. Submit the file on a compact disc, flash drive, or other commonly used electronic storage medium and clearly mark the medium as CBI. Mail the electronic medium to U.S. EPA/OAQPS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404–02, 4930 Old Page Rd., Durham, NC 27703. The same file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described in paragraph (i) of this section.

(i) If you are required to electronically submit a report or notification through CEDRI in the EPA's CDX, you may assert a claim of EPA system outage for failure to timely comply with the reporting requirement. To assert a claim of EPA system outage, you must meet the requirements outlined in paragraphs (i)(1) through (7) of this section.

(1) You must have been or will be precluded from accessing CEDRI and submitting a required report within the time prescribed due to an outage of either the EPA's CEDRI or CDX systems.

(2) The outage must have occurred within the period of time beginning five business days prior to the date that the submission is due.

(3) The outage may be planned or unplanned.

(4) You must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or has caused a delay in reporting.

(5) You must provide to the Administrator a written description identifying:

(i) The date(s) and time(s) when CDX or CEDRI was accessed and the system was unavailable;

(ii) A rationale for attributing the delay in reporting beyond the regulatory deadline to EPA system outage;

(iii) Measures taken or to be taken to minimize the delay in reporting; and

(iv) The date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported.

(6) The decision to accept the claim of EPA system outage and allow an extension to the reporting deadline is solely within the discretion of the Administrator.

(7) In any circumstance, the report must be submitted electronically as soon as possible after the outage is resolved.

(j) If you are required to electronically submit a report through CEDRI in the EPA's CDX, you may assert a claim of force majeure for failure to timely comply with the reporting requirement. To assert a claim of force majeure, you must meet the requirements outlined in paragraphs (j)(1) through (5) of this section.

(1) You may submit a claim if a force majeure event is about to occur, occurs, or has occurred or there are lingering effects from such an event within the period of time beginning five business days prior to the date the submission is due. For the purposes of this section, a force majeure event is defined as an event that will be or has been caused by circumstances beyond the control of the affected facility, its contractors, or any entity controlled by the affected facility that prevents you from complying with the requirement to submit a report electronically within the time period prescribed. Examples of such events are acts of nature (*e.g.,* hurricanes, earthquakes, or floods), acts of war or terrorism, or equipment failure or safety hazard beyond the control of the affected facility (*e.g.,* large scale power outage).

(2) You must submit notification to the Administrator in writing as soon as possible following the date you first knew, or through due diligence should have known, that the event may cause or has caused a delay in reporting.

(3) You must provide to the Administrator:

(i) A written description of the force majeure event;

(ii) A rationale for attributing the delay in reporting beyond the regulatory deadline to the force majeure event;

(iii) Measures taken or to be taken to minimize the delay in reporting; and

(iv) The date by which you propose to report, or if you have already met the reporting requirement at the time of the notification, the date you reported.

(4) The decision to accept the claim of force majeure and allow an extension to the reporting deadline is solely within the discretion of the Administrator.

(5) In any circumstance, the reporting must occur as soon as possible after the force majeure event occurs.

■ 14. Section 63.7132 is amended by revising paragraphs (a)(2) and (c) to read as follows:

§ 63.7132 What records must I keep?

(a) * * *

(2) Prior to the relevant compliance date for your source as specified in § 63.7083(e), the records in § 63.6(e)(3)(iii) through (v) related to startup, shutdown, and malfunction. On and after the relevant compliance date for your source as specified in § 63.7083(e), the records in paragraphs (a)(2)(i) and (ii) of this section.

(i) You must keep records for each startup period of the date, the time startup began, the time began producing on-specification lime product, and the time discharge from the kiln began for any affected source that is subject to a standard during startup that differs from the standard applicable at other times.

(ii) You must keep records of the date, time, cause and duration of each malfunction (as defined in 40 CFR 63.2) that causes an affected source to fail to meet an applicable standard; if there was also a monitoring malfunction, the date, time, cause, and duration of the monitoring malfunction; the record must list the affected source or equipment; if there was a failure to meet a particulate matter emissions limit, an estimate of the volume of each regulated pollutant emitted over the limit, and a description of the method used to estimate the emissions.

* * * * *

(c) You must keep the records required by Tables 6 and 7 to this subpart to show continuous compliance with each emission limitation that applies to you.

* * * * *

■ 15. Section 63.7133 is amended by adding paragraph (d) to read as follows:

§ 63.7133 In what form and for how long must I keep my records?

* * * * *

(d) Any records required to be maintained by this part that are submitted electronically via the EPA's CEDRI may be maintained in electronic format. This ability to maintain electronic copies does not affect the requirement for facilities to make records, data, and reports available upon request to a delegated air agency or the EPA as part of an on-site compliance evaluation.

■ 16. Section 63.7140 is amended to read as follows:

§ 63.7140 What parts of the General Provisions apply to me?

Table 9 to this subpart shows which parts of the General Provisions in §§ 63.1 through 63.16 apply to you. When there is overlap between subpart A and subpart AAAAA, as indicated in the ''Explanations'' column in Table 8, subpart AAAAA takes precedence.

■ 17. Section 63.7141 is amended by revising paragraph (c) to read as follows:

§ 63.7141 Who implements and enforces this subpart?

* * * * *

(c) The authorities that will not be delegated to State, local, or tribal agencies are as specified in paragraphs (c)(1) through (7) of this section.

(1) Approval of alternatives to the non-opacity emission limitations in § 63.7090(a).

(2) Approval of alternative opacity emission limitations in § 63.7090(a) and (c).

(3) Approval of alternatives to the operating limits in § 63.7090(b).

(4) Approval of major alternatives to test methods under § 63.7(e)(2)(ii) and (f) and as defined in § 63.90.

(5) Approval of major alternatives to monitoring under § 63.8(f) and as defined in § 63.90.

(6) Approval of major alternatives to recordkeeping and reporting under § 63.10(f) and as defined in § 63.90.

(7) Approval of an alternative to any electronic reporting to the EPA required by this subpart.

■ 18. Section 63.7142 is amended by:

■ a. Revising paragraph (a)(1);

■ b. Redesignating paragraphs (a)(2) and (a)(3) as paragraphs (a)(3) and (a)(4);

■ c. Adding new paragraph (a)(2);

■ d. Revising newly designated paragraph (a)(4) introductory text, and paragraphs (a)(4)(i), and (a)(4)(v);

■ e. Redesignating paragraphs (b)(2) and (b)(3) as paragraphs (b)(3) and (b)(4);

■ f. Adding new paragraph (b)(2); and

■ g. Revising newly designated paragraphs (b)(3) and (b)(4).

The revisions and additions read as follows:

§ 63.7142 What are the requirements for claiming area source status?

(a) * * *

(1) EPA Method 320 of appendix A to this part, or

(2) As an alternative to Method 320 of Appendix A, ASTM D6348–03 (Reapproved 2010) including Annexes A1 through A8 (incorporated by reference—see § 63.14). ASTM D6348–12e1 (incorporated by reference—see § 63.14) is an acceptable alternative to EPA Method 320 of appendix A, provided that the provisions of paragraphs (a)(2)(i) and (ii) of this section are followed:

(i) The test plan preparation and implementation in the Annexes to ASTM D6348–03 (Reapproved 2010), Sections A1 through A8 are mandatory.

(ii) In ASTM D6348–03 (Reapproved 2010) Annex A5 (Analyte Spiking Technique), the percent recovery (%R) must be determined for each target analyte (Equation A5.5). In order for the test data to be acceptable for a compound, %R must be greater than or equal to 70 percent and less than or equal to 130 percent. If the %R value does not meet this criterion for a target compound, the test data are not acceptable for that compound and the test must be repeated for that analyte (*i.e.,* the sampling and/or analytical procedure should be adjusted before a retest). The %R value for each compound must be reported in the test report, and all field measurements must be corrected with the calculated %R value for that compound by using the following equation: Reported Results = ((Measured Concentration in the Stack))/(%R) × 100; or

* * * * *

(4) As an alternative to EPA Method 321, ASTM Method D6735–01 (Reapproved 2009), (incorporated by reference—see § 63.14), provided that the provisions in paragraphs (a)(3)(i) through (vi) of this section are followed.

(i) A test must include three or more runs in which a pair of samples is obtained simultaneously for each run according to section 11.2.6 of ASTM Method D6735–01 (Reapproved 2009).

* * * * *

(v) The post-test analyte spike procedure of section 11.2.7 of ASTM Method D6735–01 (Reapproved 2009) is conducted, and the percent recovery is calculated according to section 12.6 of ASTM Method D6735–01 (Reapproved 2009).

* * * * *

(b) * * *

(2) As an alternative to Method 320 of Appendix A, ASTM D6348–03 (Reapproved 2010) including Annexes A1 through A8 (incorporated by reference—see § 63.14). ASTM D6348–12e1 (incorporated by reference—see § 63.14) is an acceptable alternative to EPA Method 320 of appendix A, provided that the provisions of paragraphs (b)(2)(i) and (ii) of this section are followed:

(i) The test plan preparation and implementation in the Annexes to ASTM D6348–03 (Reapproved 2010), Sections A1 through A8 are mandatory.

(ii) In ASTM D6348–03 (Reapproved 2010) Annex A5 (Analyte Spiking Technique), the percent recovery (%R) must be determined for each target analyte (Equation A5.5). In order for the test data to be acceptable for a compound, %R must be greater than or equal to 70 percent and less than or equal to 130 percent. If the %R value does not meet this criterion for a target compound, the test data are not acceptable for that compound and the test must be repeated for that analyte (*i.e.,* the sampling and/or analytical procedure should be adjusted before a retest). The %R value for each compound must be reported in the test report, and all field measurements must be corrected with the calculated %R value for that compound by using the following equation: Reported Results = ((Measured Concentration in the Stack))/(%R) × 100; or

(3) Method 18 of appendix A–6 to part 60 of this chapter; or

(4) As an alternative to Method 18, ASTM D6420–99 (Reapproved 2010), (incorporated by reference—see § 63.14), provided that the provisions of paragraphs (b)(3)(i) through (iv) of this section are followed:

(i) The target compound(s) are those listed in section 1.1 of ASTM D6420–99 (Reapproved 2010) as measurable;

(ii) This ASTM should not be used for methane and ethane because their atomic mass is less than 35 and

(iii) ASTM D6420–99 (Reapproved 2010) should never be specified as a total VOC method.

* * * * *

■ 19. Section 63.7143 is amended by:

■ a. Revising paragraph (3) under the definition of ''Deviation.''

■ b. Adding in alphabetical order definitions for ''On-specification lime product,'' ''Shutdown'' and ''Startup.''

The revisions read as follows:

§ 63.7143 What definitions apply to this subpart?

* * * * *

Deviation * * *

(3) Prior to the relevant compliance date for your source as specified in § 63.7083(e), fails to meet any emission limitation (including any operating limit) in this subpart during startup, shutdown, or malfunction, regardless of whether or not such failure is allowed by this subpart.

* * * * *

On-specification Lime Product means lime product that has been sufficiently calcined to meet end use requirements.

* * * * *

Shutdown means the cessation of kiln operation. Shutdown begins when feed to the kiln is reduced below planned production quantities and ends when stone feed is halted and fuel combustion from the main burner ceases.

* * * * *

Startup means the beginning of kiln operation. Startup begins when a shutdown kiln begins firing fuel in the main burner. Startup ends when the lime kiln first generates on-specification lime product or 12 hours following first discharge from the kiln, whichever is earlier.

* * * * *

■ 20. Table 1 to subpart AAAAA is amended by revising the introductory text to read as follows:

Table 1 to Subpart AAAAA of Part 63—Emission Limits

As required in § 63.7090(a), you must meet each emission limit in the following table that applies to you, except for kilns and coolers during startup and shutdown (See Table 2 for emission limits for kilns and coolers during startup and shutdown).

* * * * *

■ 21. Redesignate tables 2 through 8 to subpart AAAAA as tables 3 through 9 to subpart AAAA.

■ 22. Add new Table 2 to subpart AAAAA to read as follows:

As required in § 63.7090(b), on and after the relevant compliance date for your source as specified in § 63.7083(e), you must meet each emission limit in the following table that applies to you.

TABLE 2 TO SUBPART AAAAA OF PART 63—STARTUP AND SHUTDOWN EMISSION LIMITS FOR KILNS AND COOLERS

For . . .	You must meet the following emission limit	You have demonstrated compliance, if after following the requirements in § 63.7112 . . .
1. All new and existing lime kilns and their associated coolers equipped with an FF or an ESP during each startup.	Emissions must not exceed 15 percent opacity (based on startup period block average).	i. Installed, maintained, calibrated and operated a COMS as required by 40 CFR part 63, subpart A, General Provisions and according to PS–1 of appendix B to part 60 of this chapter, except as specified in § 63.7113(g)(2); ii. Collected the COMS data at a frequency of at least once every 15 seconds, determining block averages for each startup period and demonstrating for each startup block period the average opacity does not exceed 15 percent.
2. All existing lime kilns and their associated coolers that have a wet scrubber during each startup.	See item 2.b of Table 3 of subpart AAAAA for emission limit.	See item 1 of Table 6 of subpart AAAAA for requirements for demonstrating compliance.
3. All new and existing lime kilns and their associated coolers equipped with an FF or an ESP during shutdown.	Emissions must not exceed 15 percent opacity (based on 6-minute average opacity for any 6-minute block period does not exceed 15 percent).	i. Installed, maintained, calibrated and operated a COMS as required by 40 CFR part 63, subpart A, General Provisions and according to PS–1 of appendix B to part 60 of this chapter, except as specified in § 63.7113(g)(2); ii. Collecting the COMS data at a frequency of at least once every 15 seconds, determining block averages for each 6-minute period and demonstrating for each 6-minute block period the average opacity does not exceed 15 percent.
4. All existing lime kilns and their associated coolers that have a wet scrubber during shutdown.	See item 2.b of Table 3 of subpart AAAAA for emission limit.	See item 1 of Table 6 of subpart AAAAA for requirements for demonstrating compliance.

■ 23. Revise newly redesignated Table 3 to subpart AAAAA to read as follows:

As required in § 63.7090(b), you must meet each operating limit in the following table that applies to you, except for kilns and coolers during startup and shutdown (See Table 2 for operating limits during startup and shutdown).

TABLE 3 TO SUBPART AAAAA OF PART 63—OPERATING LIMITS

For . . .	You must . . .
1. Each lime kiln and each lime cooler (if there is a separate exhaust to the atmosphere from the associated lime cooler) equipped with an FF.	Maintain and operate the FF such that the BLDS or PM detector alarm condition does not exist for more than 5 percent of the total operating time in a 6-month period; and comply with the requirements in § 63.7113(d) through (f) and Table 6 to this subpart. In lieu of a BLDS or PM detector maintain the FF such that the 6-minute average opacity for any 6-minute block period does not exceed 15 percent; and comply with the requirements in § 63.7113(f) and (g) and Table 6 to this subpart.
2. Each lime kiln equipped with a wet scrubber.	a. Maintain the 3-hour block exhaust gas stream pressure drop across the wet scrubber greater than or equal to the pressure drop operating limit established during the most recent PM performance test; and b. Maintain the 3-hour block scrubbing liquid flow rate greater than the flow rate operating limit established during the most recent performance test.
3. Each lime kiln equipped with an electrostatic precipitator.	Install a PM detector and maintain and operate the ESP such that the PM detector alarm is not activated and alarm condition does not exist for more than 5 percent of the total operating time in a 6-month period, and comply with § 63.7113(e); or, maintain the ESP such that the 6-minute average opacity for any 6-minute block period does not exceed 15 percent, and comply with the requirements in § 63.7113(g); and comply with the requirements in § 63.7113(f) and Table 6 to this subpart.
4. Each PSH operation subject to a PM limit which uses a wet scrubber.	Maintain the 3-hour block average exhaust gas stream pressure drop across the wet scrubber greater than or equal to the pressure drop operating limit established during the PM performance test; and maintain the 3-hour block average scrubbing liquid flow rate greater than or equal to the flow rate operating limit established during the performance test.
5. All affected sources	Prepare a written OM&M plan; the plan must include the items listed in § 63.7100(d) and the corrective actions to be taken when required in Table 6 to this subpart.
6. Each emission unit equipped with an add-on air pollution control device.	a. Vent captured emissions through a closed system, except that dilution air may be added to emission streams for the purpose of controlling temperature at the inlet to an FF; and b. Operate each capture/collection system according to the procedures and requirements in the OM&M plan.

■ 24. Revise newly redesignated Table 4 to subpart AAAAA to read as follows:

As required in § 63.7114, you must demonstrate initial compliance with each emission limitation that applies to you, according to the following table.

TABLE 4 TO SUBPART AAAAA OF PART 63—INITIAL COMPLIANCE WITH EMISSION LIMITS

For . . .	For the following emission limit . . .	You have demonstrated initial compliance, if after following the requirements in § 63.7112 . . .
1. All new or existing lime kilns and their associated lime coolers (kilns/coolers).	PM emissions must not exceed 0.12 lb/tsf for all existing kilns/coolers with dry controls, 0.60 lb/tsf for existing kilns/coolers with wet scrubbers, 0.10 lb/tsf for all new kilns/coolers, or a weighted average calculated according to Eq. 3 in § 63.7112.	The kiln outlet PM emissions (and if applicable, summed with the separate cooler PM emissions), based on the PM emissions measured using Method 5 in appendix A to part 60 of this chapter and the stone feed rate measurement over the period of initial performance test, do not exceed the emission limit; if the lime kiln is controlled by an FF or ESP and you are opting to monitor PM emissions with a BLDS or PM detector, you have installed and are operating the monitoring device according to the requirements in § 63.7113(d) or (e), respectively; and if the lime kiln is controlled by an FF or ESP and you are opting to monitor PM emissions using a COMS, you have installed and are operating the COMS according to the requirements in § 63.7113(g).
2. Stack emissions from all PHS operations at a new or existing affected source.	PM emissions must not exceed 0.05 g/dscm	The outlet PM emissions, based on Method 5 or Method 17 in appendix A to part 60 of this chapter, over the period of the initial performance test do not exceed 0.05 g/dscm; and if the emission unit is controlled with a wet scrubber, you have a record of the scrubber's pressure drop and liquid flow rate operating parameters over the 3-hour performance test during which emissions did not exceed the emissions limitation.
3. Stack emissions from all PSH operations at a new or existing affected source, unless the stack emissions are discharged through a wet scrubber control device.	Emissions must not exceed 7 percent opacity	Each of the thirty 6-minute opacity averages during the initial compliance period, using Method 9 in appendix A to part 60 of this chapter, does not exceed the 7 percent opacity limit. At least thirty 6-minute averages must be obtained.
4. Fugitive emissions from all PSH operations at a new or existing affected source.	Emissions must not exceed 10 percent opacity	Each of the 6-minute opacity averages during the initial compliance period, using Method 9 in appendix A to part 60 of this chapter, does not exceed the 10 percent opacity limit.
5. All PSH operations at a new or existing affected source, enclosed in building.	All of the individually affected PSH operations must comply with the applicable PM and opacity emission limitations for items 2 through 4 of this Table 4, or the building must comply with the following: There must be no VE from the building, except from a vent, and vent emissions must not exceed the emission limitations in items 2 and 3 of this Table 4.	All the PSH operations enclosed in the building have demonstrated initial compliance according to the applicable requirements for items 2 through 4 of this Table 4; or if you are complying with the building emission limitations, there are no VE from the building according to item 18 of Table 5 to this subpart and § 63.7112(k), and you demonstrate initial compliance with applicable building vent emissions limitations according to the requirements in items 2 and 3 of this Table 4.
6. Each FF that controls emissions from only an individual storage bin.	Emissions must not exceed 7 percent opacity	Each of the ten 6-minute averages during the 1-hour initial compliance period, using Method 9 in appendix A to part 60 of this chapter, does not exceed the 7 percent opacity limit.
7. Each set of multiple storage bins with combined stack emissions.	You must comply with emission limitations in items 2 and 3 of this Table 4.	You demonstrate initial compliance according to the requirements in items 2 and 3 of this Table 4.

■ 25. Revise newly redesignated Table 5 to subpart AAAAA to read as follows:

As required in § 63.7112, you must conduct each performance test in the following table that applies to you.

TABLE 5 TO SUBPART AAAAA OF PART 63—REQUIREMENTS FOR PERFORMANCE TESTS

For . . .	You must . . .	Using . . .	According to the following requirements . . .
1. Each lime kiln and each associated lime cooler, if there is a separate exhaust to the atmosphere from the associated lime cooler.	Select the location of the sampling port and the number of traverse ports.	Method 1 or 1A of appendix A to part 60 of this chapter; and § 63.6(d)(1)(i).	Sampling sites must be located at the outlet of the control device(s) and prior to any releases to the atmosphere.

TABLE 5 TO SUBPART AAAAA OF PART 63—REQUIREMENTS FOR PERFORMANCE TESTS—Continued

For . . .	You must . . .	Using . . .	According to the following requirements . . .
2. Each lime kiln and each associated lime cooler, if there is a separate exhaust to the atmosphere from the associated lime cooler.	Determine velocity and volumetric flow rate.	Method 2, 2A, 2C, 2D, 2F, or 2G in appendix A to part 60 of this chapter.	Not applicable.
3. Each lime kiln and each associated lime cooler, if there is a separate exhaust to the atmosphere from the associated lime cooler.	Conduct gas molecular weight analysis.	Method 3, 3A, or 3B in appendix A to part 60 of this chapter.	You may use ASME PTC 19.10–1981—Part 10 (available for purchase from Three Park Avenue, New York, NY 10016–5990) as an alternative to using the manual procedures (but not instrumental procedures) in Method 3B.
4. Each lime kiln and each associated lime cooler, if there is a separate exhaust to the atmosphere from the associated lime cooler.	Measure moisture content of the stack gas.	Method 4 in appendix A to part 60 of this chapter.	Not applicable.
5. Each lime kiln and each associated lime cooler, if there is a separate exhaust to the atmosphere from the associated lime cooler, and which uses a negative pressure PM control device.	Measure PM emissions.	Method 5 in appendix A to part 60 of this chapter.	Conduct the test(s) when the source is operating at representative operating conditions in accordance with § 63.7(e) before the relevant compliance date for your source as specified in § 63.7083(e) and § 63.7112(b) on and after the relevant compliance date for your source as specified in § 63.7083(e); the minimum sampling volume must be 0.85 dry standard cubic meter (dscm) (30 dry standard cubic foot (dscf)); if there is a separate lime cooler exhaust to the atmosphere, you must conduct the Method 5 test of the cooler exhaust concurrently with the kiln exhaust test.
6. Each lime kiln and each associated lime cooler, if there is a separate exhaust to the atmosphere from the associated lime cooler, and which uses a positive pressure FF or ESP.	Measure PM emissions.	Method 5D in appendix A to part 60 of this chapter.	Conduct the test(s) when the source is operating at representative operating conditions in accordance with § 63.7(e) before the relevant compliance date for your source as specified in § 63.7083(e) and § 63.7112(b) on and after the relevant compliance date for your source as specified in § 63.7083(e); if there is a separate lime cooler exhaust to the atmosphere, you must conduct the Method 5 test of the separate cooler exhaust concurrently with the kiln exhaust test.
7. Each lime kiln	Determine the mass rate of stone feed to the kiln during the kiln PM emissions test.	Any suitable device	Calibrate and maintain the device according to manufacturer's instructions; the measuring device used must be accurate to within ±5 percent of the mass rate of stone feed over its operating range.
8. Each lime kiln equipped with a wet scrubber.	Establish the operating limit for the average gas stream pressure drop across the wet scrubber.	Data for the gas stream pressure drop measurement device during the kiln PM performance test.	The continuous pressure drop measurement device must be accurate within plus or minus 1 percent; you must collect the pressure drop data during the period of the performance test and determine the operating limit according to § 63.7112(j).
9. Each lime kiln equipped with a wet scrubber.	Establish the operating limit for the average liquid flow rate to the scrubber.	Data from the liquid flow rate measurement device during the kiln PM performance test.	The continuous scrubbing liquid flow rate measuring device must be accurate within plus or minus 1 percent; you must collect the flow rate data during the period of the performance test and determine the operating limit according to § 63.7112(j).
10. Each lime kiln equipped with a FF or ESP that is monitored with a PM detector.	Have installed and have operating the BLDS or PM detector prior to the performance test.	Standard operating procedures incorporated into the OM&M plan.	According to the requirements in § 63.7113(d) or (e), respectively.

TABLE 5 TO SUBPART AAAAA OF PART 63—REQUIREMENTS FOR PERFORMANCE TESTS—Continued

For . . .	You must . . .	Using . . .	According to the following requirements . . .
11. Each lime kiln equipped with a FF or ESP that is monitored with a COMS.	Have installed and have operating the COMS prior to the performance test.	Standard operating procedures incorporated into the OM&M plan and as required by 40 CFR part 63, subpart A, General Provisions and according to PS–1 of appendix B to part 60 of this chapter, except as specified in § 63.7113(g)(2).	According to the requirements in § 63.7113(g).
12. Each stack emission from a PSH operation, vent from a building enclosing a PSH operation, or set of multiple storage bins with combined stack emissions, which is subject to a PM emission limit.	Measure PM emissions.	Method 5 or Method 17 in appendix A to part 60 of this chapter.	The sample volume must be at least 1.70 dscm (60 dscf); for Method 5, if the gas stream being sampled is at ambient temperature, the sampling probe and filter may be operated without heaters; and if the gas stream is above ambient temperature, the sampling probe and filter may be operated at a temperature high enough, but no higher than 121 °C (250 °F), to prevent water condensation on the filter (Method 17 may be used only with exhaust gas temperatures of not more than 250 °F).
13. Each stack emission from a PSH operation, vent from a building enclosing a PSH operation, or set of multiple storage bins with combined stack emissions, which is subject to an opacity limit.	Conduct opacity observations.	Method 9 in appendix A to part 60 of this chapter.	The test duration must be for at least 3 hours and you must obtain at least thirty, 6-minute averages.
14. Each stack emissions source from a PSH operation subject to a PM or opacity limit, which uses a wet scrubber.	Establish the average gas stream pressure drop across the wet scrubber.	Data for the gas stream pressure drop measurement device during the PSH operation stack PM performance test.	The pressure drop measurement device must be accurate within plus or minus 1 percent; you must collect the pressure drop data during the period of the performance test and determine the operating limit according to § 63.7112(j).
15. Each stack emissions source from a PSH operation subject to a PM or opacity limit, which uses a wet scrubber.	Establish the operating limit for the average liquid flow rate to the scrubber.	Data from the liquid flow rate measurement device during the PSH operation stack PM performance test.	The continuous scrubbing liquid flow rate measuring device must be accurate within plus or minus 1 percent; you must collect the flow rate data during the period of the performance test and determine the operating limit according to § 63.7112(j).
16. Each FF that controls emissions from only an individual, enclosed, new or existing storage bin.	Conduct opacity observations.	Method 9 in appendix A to part 60 of this chapter.	The test duration must be for at least 1 hour and you must obtain ten 6-minute averages.
17. Fugitive emissions from any PSH operation subject to an opacity limit.	Conduct opacity observations.	Method 9 in appendix A to part 60 of this chapter.	The test duration must be for at least 3 hours, but the 3-hour test may be reduced to 1 hour if, during the first 1-hour period, there are no individual readings greater than 10 percent opacity and there are no more than three readings of 10 percent during the first 1-hour period.
18. Each building enclosing any PSH operation, that is subject to a VE limit.	Conduct VE check	The specifications in § 63.7112(k)	The performance test must be conducted while all affected PSH operations within the building are operating; the performance test for each affected building must be at least 75 minutes, with each side of the building and roof being observed for at least 15 minutes.

■ 26. Amend newly redesignated Table 6 to subpart AAAAA by revising the introductory text to read as follows:

As required in § 63.7121, you must demonstrate continuous compliance with each operating limit listed in Table 3 to subpart AAAAA that applies to you, according to the following table:

Table 6 to Subpart AAAAA of Part 63—Continuous Compliance With Operating Limits

* * * * *

■ 27. Revise newly redesignated Table 7 to subpart AAAAA to read as follows:

As required in § 63.7121 you must periodically demonstrate compliance with each opacity and VE limit that applies to you, according to the following table:

TABLE 7 TO SUBPART AAAAA OF PART 63—PERIODIC MONITORING FOR COMPLIANCE WITH OPACITY AND VISIBLE EMISSIONS LIMITS

For . . .	For the following emission limitation . . .	You must demonstrate ongoing compliance . . .
1. Each PSH operation subject to an opacity limitation as required in Table 1 to this subpart, or any vents from buildings subject to an opacity limitation.	a. 7–10 percent opacity, depending on the PSH operation, as required in Table 1 to this subpart.	(i) Conducting a monthly 1-minute VE check of each emission unit in accordance with § 63.7121(e); the check must be conducted while the affected source is in operation; (ii) If no VE are observed in 6 consecutive monthly checks for any emission unit, you may decrease the frequency of VE checking from monthly to semi-annually for that emission unit; if VE are observed during any semiannual check, you must resume VE checking of that emission unit on a monthly basis and maintain that schedule until no VE are observed in 6 consecutive monthly checks; (iii) If no VE are observed during the semiannual check for any emission unit, you may decrease the frequency of VE checking from semi-annually to annually for that emission unit; if VE are observed during any annual check, you must resume VE checking of that emission unit on a monthly basis and maintain that schedule until no VE are observed in 6 consecutive monthly checks; and (iv) If VE are observed during any VE check, you must conduct a 6-minute test of opacity in accordance with Method 9 of appendix A to part 60 of this chapter; you must begin the Method 9 test within 1 hour of any observation of VE and the 6-minute opacity reading must not exceed the applicable opacity limit.
2. Any building subject to a VE limit, according to item 8 of Table 1 to this subpart.	a. No VE	(i) Conducting a monthly VE check of the building, in accordance with the specifications in § 63.7112(k); the check must be conducted while all the enclosed PSH operations are operating; (ii) The check for each affected building must be at least 5 minutes, with each side of the building and roof being observed for at least 1 minute; (iii) If no VE are observed in 6 consecutive monthly checks of the building, you may decrease the frequency of checking from monthly to semi-annually for that affected source; if VE are observed during any semi-annual check, you must resume checking on a monthly basis and maintain that schedule until no VE are observed in 6 consecutive monthly checks; and (iv) If no VE are observed during the semi-annual check, you may decrease the frequency of checking from semi-annually to annually for that affected source; and if VE are observed during any annual check, you must resume checking of that emission unit on a monthly basis and maintain that schedule until no VE are observed in 6 consecutive monthly checks (the source is in compliance if no VE are observed during any of these checks).

■ 28. Revise newly redesignated Table 8 to subpart AAAAA to read as follows:

As required in § 63.7131, you must submit each report in this table that applies to you.

TABLE 8 TO SUBPART AAAAA OF PART 63—REQUIREMENTS FOR REPORTS

You must submit a . . .	The report must contain . . .	You must submit the report . . .
1. Compliance report	a. If there are no deviations from any emission limitations (emission limit, operating limit, opacity limit, and VE limit) that applies to you, a statement that there were no deviations from the emission limitations during the reporting period;	Semiannually according to the requirements in § 63.7131(b).
	b. If there were no periods during which the CMS, including any operating parameter monitoring system, was out-of-control as specified in § 63.8(c)(7), a statement that there were no periods during which the CMS was out-of-control during the reporting period;	Semiannually according to the requirements in § 63.7131(b).
	c. If you have a deviation from any emission limitation (emission limit, operating limit, opacity limit, and VE limit) during the reporting period, the report must contain the information in § 63.7131(d);	Semiannually according to the requirements in § 63.7131(b).

TABLE 8 TO SUBPART AAAAA OF PART 63—REQUIREMENTS FOR REPORTS—Continued

You must submit a . . .	The report must contain . . .	You must submit the report . . .
	d. If there were periods during which the CMS, including any operating parameter monitoring system, was out-of-control, as specified in § 63.8(c)(7), the report must contain the information in § 63.7131(e); and	Semiannually according to the requirements in § 63.7131(b).
	e. Before the relevant compliance date for your source as specified in § 63.7083(e), if you had a startup, shutdown or malfunction during the reporting period and you took actions consistent with your SSMP, the compliance report must include the information in § 63.10(d)(5)(i). On and after the relevant compliance date for your source as specified in § 63.7083(e), if you had a startup, shutdown or malfunction during the reporting period and you failed to meet an applicable standard, the compliance report must include the information in § 63.7131(c)(3).	Semiannually according to the requirements in § 63.7131(b).
2. Before the relevant compliance date for your source as specified in § 63.7083(e), an immediate startup, shutdown, and malfunction report if you had a startup, shutdown, or malfunction during the reporting period that is not consistent with your SSMP.	Actions taken for the event	By fax or telephone within 2 working days after starting actions inconsistent with the SSMP.
3. Before the relevant compliance date for your source as specified in § 63.7083(e), an immediate startup, shutdown, and malfunction report if you had a startup, shutdown, or malfunction during the reporting period that is not consistent with your SSMP.	The information in § 63.10(d)(5)(ii)	By letter within 7 working days after the end of the event unless you have made alternative arrangements with the permitting authority. See § 63.10(d)(5)(ii).
(4) Performance Test Report	The information required in § 63.7(g)	According to the requirements of § 63.7131.

■ 29. Revise newly redesignated Table 9 to subpart AAAAA to read as follows:

As required in § 63.7140, you must comply with the applicable General Provisions requirements according to the following table:

TABLE 9 TO SUBPART AAAAA OF PART 63—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART AAAAA

Citation	Summary of requirement	Am I subject to this requirement?	Explanations
§ 63.1(a)(1)–(4)	Applicability	Yes.	
§ 63.1(a)(5)		No.	
§ 63.1(a)(6)	Applicability	Yes.	
§ 63.1(a)(7)–(a)(9)		No.	
§ 63.1(a)(10)–(a)(14)	Applicability	Yes.	
§ 63.1(b)(1)	Initial Applicability Determination	Yes	§§ 63.7081 and 63.7142 specify additional applicability determination requirements.
§ 63.1(b)(2)		No.	
§ 63.1(b)(3)	Initial Applicability Determination	Yes.	
§ 63.1(c)(1)	Applicability After Standard Established.	Yes.	
§ 63.1(c)(2)	Permit Requirements	No	Area sources not subject to subpart AAAAA, except all sources must make initial applicability determination.
§ 63.1(c)(3)–(4)		No.	
§ 63.1(c)(5)	Area Source Becomes Major	Yes.	
§ 63.1(d)		No.	
§ 63.1(e)	Applicability of Permit Program	Yes.	
§ 63.2	Definitions	Yes	Additional definitions in § 63.7143.
§ 63.3(a)–(c)	Units and Abbreviations	Yes.	
§ 63.4(a)(1)–(a)(2)	Prohibited Activities	Yes.	
§ 63.4(a)(3)–(a)(5)		No.

§ 63.6(i)(16)	Extension of Compliance	Yes.	
§ 63.6(j)	Exemption from Compliance	Yes.	
§ 63.7(a)(1)–(a)(3)	Performance Testing Requirements.	Yes	§ 63.7110 specifies deadlines; § 63.7112 has additional specific requirements.
§ 63.7(b)	Notification	Yes.	
§ 63.7(c)	Quality Assurance/Test Plan	Yes.	
§ 63.7(d)	Testing Facilities	Yes.	
§ 63.7(e)(1)	Conduct of Tests	Yes before the relevant compliance date for your source as specified in § 63.7083(e). No on and after the relevant compliance date for your source as specified in § 63.7083(e).	On and after the relevant compliance date for your source as specified in § 63.7083(e), see § 63.7112(b).
§ 63.7(e)(2)–(4)	Conduct of Tests	Yes.	
§ 63.7(f)	Alternative Test Method	Yes.	
§ 63.7(g)	Data Analysis	Yes.	
§ 63.7(h)	Waiver of Tests	Yes.	
§ 63.8(a)(1)	Monitoring Requirements	Yes	See § 63.7113.
§ 63.8(a)(2)	Monitoring	Yes.	
§ 63.8(a)(3)		No.	
§ 63.8(a)(4)	Monitoring	No	Flares not applicable.
§ 63.8(b)(1)–(3)	Conduct of Monitoring	Yes.	
§ 63.8(c)(1)(i)	CMS Operation/Maintenance	Yes before the relevant compliance date for your source as specified in § 63.7083(e). No on and after the relevant compliance date for your source as specified in § 63.7083(e).	On and after the relevant compliance date for your source as specified in § 63.7083(e), see § 63.7100 for OM&M requirements.
§ 63.8(c)(1)(ii)	CMS Spare Parts	Yes.	
§ 63.8(c)(1)(iii)	Requirement to Develop SSM Plan for CMS.	Yes before the relevant compliance date for your source as specified in § 63.7083(e). No on and after the relevant compliance date for your source as specified in § 63.7083(e).	On and after the relevant compliance date for your source as specified in § 63.7083(e), no longer required.
§ 63.8(c)(2)–(3)	CMS Operation/Maintenance	Yes.	
§ 63.8(c)(4)	CMS Requirements	No	See § 63.7121.
§ 63.8(c)(4)(i)–(ii)	Cycle Time for COM and CEMS	Yes	No CEMS are required under subpart AAAAA; see § 63.7113 for CPMS requirements.
§ 63.8(c)(5)	Minimum COM procedures	Yes	COM not required.
§ 63.8(c)(6)	CMS Requirements	No	See § 63.7113.
§ 63.8(c)(7)–(8)	CMS Requirements	Yes.	
§ 63.8(d)(1)–(2)	Quality Control	Yes	See also § 63.7113.
§ 63.8(d)(3)	Quality Control	Yes before the relevant compliance date for your source as specified in § 63.7083(e). No on and after the relevant compliance date for your source as specified in § 63.7083(e).	
§ 63.8(e)	Performance Evaluation for CMS	Yes	See also § 63.7113.
§ 63.8(f)(1)–(f)(5)	Alternative Monitoring Method	Yes.	
§ 63.8(f)(6)	Alternative to Relative Accuracy Test for CEMS.	No	No CEMS required in subpart AAAAA.
§ 63.8(g)(1)–(g)(5)	Data Reduction; Data That Cannot Be Used.	No	See data reduction requirements in §§ 63.7120 and 63.7121.
§ 63.9(a)	Notification Requirements	Yes	See § 63.7130.
§ 63.9(b)	Initial Notifications	Yes.	
§ 63.9(c)	Request for Compliance Extension.	Yes.	
§ 63.9(d)	New Source Notification for Special Compliance Requirements.	Yes.	
§ 63.9(e)	Notification of Performance Test	Yes.	
§ 63.9(f)	Notification of VE/Opacity Test	Yes	This requirement only applies to opacity and VE performance tests required in Table 5 to subpart AAAAA. Notification not required for VE/opacity test under Table 7 to subpart AAAAA.
§ 63.9(g)	Additional CMS Notifications	No	Not required for operating parameter monitoring.

Mercury and Air Toxics Standards for Power Plants Electronic Reporting Revisions

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: The U.S Environmental Protection Agency (EPA) is finalizing amendments to the electronic reporting requirements for the National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units (also known as the Mercury and Air Toxics Standards (MATS)). This action revises and streamlines the electronic data reporting requirements of MATS, increases data transparency by requiring use of one electronic reporting system instead of two separate systems, and provides enhanced access to MATS data. No new monitoring requirements are imposed by this final action; instead, this action reduces reporting burden, increases MATS data flow and usage, makes it easier for inspectors and auditors to assess compliance, and encourages wider use of continuous emissions monitoring systems (CEMS) for MATS compliance. In addition, this final action extends the current deadline for alternative electronic data submission via portable document format (PDF) files through December 31, 2023.

DATES: This final rule is effective on September 9, 2020.

ADDRESSES: The EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2018–0794. All documents in the docket are listed on the *https://www.regulations.gov/* website. Although listed, some information is not publicly available, *e.g.,* Confidential Business Information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the internet and will be publicly available only in hard copy form. Publicly available docket materials are available electronically through *https://www.regulations.gov/.* Out of an abundance of caution for members of the public and our staff, the EPA Docket Center and Reading Room was closed to the public, with limited exceptions, to reduce the risk of transmitting COVID–19. Our Docket Center staff will continue to provide remote customer service via email, phone, and webform. For further information and updates on EPA Docket Center services and the current status, please visit us online at *https://www.epa.gov/dockets.*

FOR FURTHER INFORMATION CONTACT: Mr. Barrett Parker, Sector Policies and Programs Division (D243–05), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, NC 27711; telephone number: (919) 541–5635; email address: *parker.barrett@epa.gov.* For general information concerning MATS, contact Ms. Mary Johnson, Sector Policies and Programs Division (D243–01), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, NC 27711; telephone number: (919) 541–5025; email address: *johnson.mary@epa.gov.* For questions concerning the Emissions Collection and Monitoring Plan System (ECMPS) Client Tool and its implementation, contact Mr. Christopher Worley, Clean Air Markets Division, Mail Code 6204M, U.S. Environmental Protection Agency, 1200 Pennsylvania Ave. NW, Washington, DC 20460; telephone number: (202) 343–9531; email address: *worley.christopher@epa.gov.*

SUPPLEMENTARY INFORMATION: The information in this preamble is organized as follows:

Table of Contents

I. General Information
A. Does this action apply to me?
B. Where can I get a copy of this document and other related information?
C. Judicial Review and Administrative Reconsideration
D. What action is the Agency taking?
E. What is the Agency's authority for taking this action?
F. What are the incremental costs and benefits of this action?
II. Background
III. What is the scope of these amendments?
IV. What are the specific amendments to 40 CFR part 63, subpart UUUUU as a result of this action?
A. Revisions to the Reporting Requirements of MATS
B. Revisions to Appendix A
C. Revisions to Appendix B
D. Addition to Appendix C
E. Addition to Appendix D
F. Addition to Appendix E
V. Revisions to Other Rule Text
VI. Statutory and Executive Order Reviews

L. Congressional Review Act (CRA)

I. General Information

A. Does this action apply to me?

Categories and entities potentially affected by this action include:

Category	NAICS code [1]	Examples of potentially regulated entities
Industry	221112	Fossil fuel-fired electric utility steam generating units (EGUs).
Federal government	[2] 221122	Fossil fuel-fired EGUs owned by the federal government.
State/local/tribal government	[2] 221122	Fossil fuel-fired EGUs owned by municipalities.
	921150	Fossil fuel-fired EGUs in Indian country.

[1] North American Industry Classification System.
[2] Federal, state, or local government-owned and operated establishments are classified according to the activity in which they are engaged.

This table is not intended to be exhaustive, but rather provides a guide for readers regarding entities likely to be regulated by this action. This table lists the types of entities that the EPA is now aware could potentially be regulated by this action. Other types of entities not listed in the table could also be regulated. To determine whether your

entity is regulated by this action, you should carefully examine the applicability criteria in 40 CFR 63.9981 of the rule. If you have questions regarding the applicability of this action to a particular entity, consult either the air permitting authority for the entity or your EPA Regional representative as listed in 40 CFR 63.13.

B. Where can I get a copy of this document and other related information?

In addition to being available in the docket, an electronic copy of this final action will also be available on the internet. Following signature by the EPA Administrator, the EPA will post a copy of this final action at: *https://www.epa.gov/mats/regulatory-actions-final-mercury-and-air-toxics-standards-mats-power-plants.* Following publication in the **Federal Register**, the EPA will post the **Federal Register** version and key technical documents at this same website.

C. Judicial Review and Administrative Reconsideration

Under Clean Air Act (CAA) section 307(b)(1), judicial review of this final action is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit by November 9, 2020. Under CAA section 307(b)(2), the requirements established by this final rule may not be challenged separately in any civil or criminal proceedings brought by the EPA to enforce the requirements.

Section 307(d)(7)(B) of the CAA further provides that only an objection to a rule or procedure which was raised with reasonable specificity during the period for public comment (including any public hearing) may be raised during judicial review. This section also provides a mechanism for the EPA to reconsider the rule if the person raising an objection can demonstrate to the Administrator that it was impracticable to raise such objection within the period for public comment or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule. Any person seeking to make such a demonstration should submit a Petition for Reconsideration to the Office of the Administrator, U.S. Environmental Protection Agency, Room 3000, WJC South Building, 1200 Pennsylvania Ave. NW, Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. Environmental Protection Agency, 1200 Pennsylvania Ave. NW, Washington, DC 20460.

D. What action is the Agency taking?

The EPA is finalizing this rule to streamline the electronic data reporting requirements of MATS; to increase data transparency by making more of the MATS data available in Extensible Markup Language (XML) format; and to amend the reporting and recordkeeping requirements associated with performance stack tests, particulate matter (PM) and hydrogen chloride (HCl) CEMS, and PM continuous parameter monitoring systems (CPMS).

E. What is the Agency's authority for taking this action?

The Agency's authority for taking this action is found at 42 U.S.C. 7401 *et seq.*

F. What are the incremental costs and benefits of this action?

As discussed in section VI.C of this preamble, this action is expected to reduce overall annual source burden by 11,000 hours per year, which when monetized is $15,079,000.

II. Background

These amendments revise the recordkeeping and reporting requirements of the MATS rule, in response to concerns raised by the regulated community. The MATS rule originally required affected EGU owners or operators to report MATS rule emissions and compliance information electronically using two data systems. See 40 CFR 63.10031 (77 FR 9304, February 16, 2012). Paragraph (a) of 40 CFR 63.10031 required EGU owners or operators that demonstrate compliance by continuously monitoring mercury (Hg) and/or HCl and/or hydrogen fluoride (HF) emissions to use the ECMPS Client Tool to submit monitoring plan information, quality assurance (QA) test results, and hourly emissions data in accordance with appendices A and B to subpart UUUUU of 40 CFR part 63. Paragraph (f) of 40 CFR 63.10031 required performance stack test results, performance evaluations of Hg, HCl, HF, sulfur dioxide (SO_2), and PM CEMS, 30-boiler operating day rolling average values for certain parameters, Notifications of Compliance Status, and semiannual compliance reports to be submitted to the EPA's WebFIRE database via the Compliance and Emissions Data Reporting Interface (CEDRI).

Subsequent to the publication of the MATS rule, stakeholders suggested to the EPA that the MATS rule electronic reporting burden could be significantly reduced if all of the required information were reported to one data system instead of two. The stakeholders also suggested that using one data system would benefit the EPA and the public in their review of MATS rule data, because the information would be reported in a consistent format. In view of these considerations, the stakeholders urged the EPA to consider amending the MATS rule to require all of the data to be reported through the ECMPS, a familiar data system that most EGU owners or operators have been using since 2009, to meet the electronic reporting requirements of the Acid Rain Program.

After careful consideration of the stakeholders' recommendations, the EPA concluded that the increased transparency of the emissions data and the reduction in reporting burden that could be achieved through the use of a single data system are consistent with Agency priorities. As a result, late in 2014, the EPA decided to take the necessary steps to require all of the electronic reports required by the MATS rule to be submitted through the ECMPS Client Tool. Those steps would include revising the MATS rule, modifying the ECMPS Client Tool, creating a detailed set of reporting instructions, and beta testing the modified software. Recognizing that insufficient time was available to complete these tasks before the initial compliance date for the MATS rule (April 16, 2015), the Agency embarked on a two-phased approach to complete them.

The first phase was completed when the EPA published a final rule requiring EGU owners or operators to suspend temporarily (until April 16, 2017) the use of the CEDRI interface as the means of submitting the reports described in 40 CFR 63.10031(f), (f)(1), (2), and (4), and to use the ECMPS Client Tool to submit PDF versions of these reports on an interim basis (see 80 FR 15510, March 24, 2015). The specific reports required to be submitted as PDF files included: Performance stack test reports containing enough information to assess compliance and to demonstrate that the testing was done properly; relative accuracy test audit (RATA) reports for SO_2, HCl, HF, and Hg CEMS; RATA reports for Hg sorbent trap monitoring systems; response correlation audit (RCA) and relative response audit (RRA) reports for PM CEMS; 30-boiler operating day rolling average reports for PM CEMS, PM CPMS, and approved hazardous air pollutants (HAP) metals CEMS; Notifications of Compliance Status; and semiannual compliance

reports. Section 63.10031(f)(6) of the March 24, 2015, final rule required each PDF version of a submitted interim report to include information that identifies the facility (name and address), the EGU(s) to which the report applies, the applicable rule citations, and other information. The rule further specified that in the event that implementation of the single data system initiative was not completed by April 16, 2017, the electronic reporting of MATS data would revert to the original two systems approach on and after that date.

In the preamble to the March 24, 2015, final rule, the EPA outlined the second phase of the single data system initiative, to be executed during the interim PDF reporting period. In phase two: (1) The Agency would publish a direct final rule, requiring MATS-affected sources to use the ECMPS Client Tool to submit all required reports; and (2) a detailed set of reporting instructions would be developed and ECMPS would be modified to receive and process the data.

Considering the magnitude of the rule changes that would be required to execute phase two, coupled with the need to specify data elements to be reported electronically for PM CEMS, PM CPMS, and HCl CEMS, the Agency decided to provide stakeholders an opportunity to review and comment on the proposed changes. The EPA issued the proposed rule on September 29, 2016.[1] The comment period for the 2016 proposal (or ''previous proposal'') was scheduled to close on October 31, 2016, but it was subsequently extended until November 15, 2016, in response to requests from several stakeholders for an extension.

Commenters were generally supportive of the initiative to simplify and streamline the MATS reporting requirements and to use the ECMPS Client Tool as the single MATS rule reporting system. However, they expressed serious concerns about the proposal to extend the interim PDF reporting process from April 16, 2017, to December 31, 2017. Although they favored an extension of the PDF reporting, they were unanimous in asserting that the proposed end date of December 31, 2017, would not allow enough time to finalize the rule, develop the necessary XML reporting formats and reporting instructions, and reprogram the ECMPS Client Tool. In addition, two data acquisition and handling system vendors stated that more time would be needed for them to adapt to the proposed changes and to develop the reporting software for their customers. Some of the commenters recommended that the EPA should extend the interim PDF reporting process through calendar year 2019; others suggested that the process should be extended for 6 to 8 calendar quarters after finalization of the rule.

In view of these considerations, on April 6, 2017, the EPA published a final rule extending the interim PDF file reporting process through June 30, 2018 (82 FR 16736). Technical corrections to appendix A were also included in the rule package. The rule went into effect on April 6, 2017. As the Agency was unable to complete the e-reporting provisions, another extension to the interim PDF file reporting process—through June 30, 2020—was promulgated on July 2, 2018 (83 FR 30879).

The Agency continued to develop the remaining electronic reporting and recordkeeping requirements, considering the comments received on the September 29, 2016 (81 FR 67062) proposal. When that effort was complete, rather than finalizing those requirements, the Agency decided to again provide stakeholders with an opportunity to review and comment on the requirements, so the Agency issued a proposal with those requirements on April 10, 2020 (85 FR 20342).

Thirty-five comment letters were received, and they are available in the docket. Many of those comments were similar to comments submitted before in other proposals and have been addressed previously. Responses for the comments on this action are included in the Response to Comments document which is also available in the docket. Significant comments can be sorted into eight groups; their general descriptions and responses follow.

1. Comments received on other MATS regulatory actions, *e.g.,* removal of the appropriate and necessary determination, are not relevant for this action and were not addressed. Likewise, comments regarding other regulatory actions, *e.g.,* insecticides and pesticides, are not relevant for this action and were not addressed.

2. A majority of commenters supported extending the use of PDF reporting until January 2024. Many industry commenters suggested splitting the package so the extension could be finalized, and more time could be spent on reviewing the other portions of the package. The Agency is not splitting the package and appreciates the support for the extension until the ECMPS Client Tool is reprogrammed and ready for use. The Agency sees no need for additional time to comment on the proposed revisions, as those revisions have been available for review and comment for over 3 years—since the September 29, 2016, proposal.

3. Commenters sought clarification on the conditions that would cause monitoring downtime to be considered a deviation, and the regulation provides that clarification.

4. Industry commenters sought to have consistent application of grace periods and ongoing QA check periods (based on operating quarters only) for PM CEMS and PM CPMS; however, these instruments differ from other CEMS because except for the annual testing, there is no other time when the monitoring system is compared to a certified reference method value to determine accuracy. This difference means that techniques allowing for additional periods before testing is required puts EGU owners or operators, as well as the environment, at additional risk of elevated emissions during such periods. Due to this difference, and its potential effects, the regulation will not provide grace periods beyond 1 calendar quarter or ongoing QA checks based on operating quarters only.

5. Commenters sought clarification on Hg low-emitting EGU (LEE) testing calculations, and the regulation provides such clarification in 40 CFR 63.10005(h)(3)(iii).

6. Some commenters continue to assert that data elements in appendix E are duplicative, but as described before, those data elements are already required and represent the minimum bits of information needed to ensure smooth operation of an electronic reporting system. Even so, clarifications from already-mentioned deviation and monitoring downtime circumstances, as well as for reporting span values and fuel usage, have been provided in appendix E.

7. One commenter asked the Agency to reconsider allowing the use of alternate semi-annual reporting submission dates established by operating permit programs, at least until the ECMPS Client Tool is operational; the Agency agrees that this flexibility should be maintained during the extension period, and the rule has been revised to allow use of such alternate semi-annual reporting dates.

8. Finally, some commenters requested continued engagement with stakeholders as the new ECMPS Client Tool software is developed and tested. Consistent with previous ECMPS reporting instructions changes and the implementation of previous MATS reporting changes, the Agency will

[1] 81 FR 67062, September 29, 2016.

provide draft reporting instructions and XML schema documentation prior to implementation and engage stakeholders during the development and testing of software.

This action finalizes an extension of the interim PDF reporting process through December 31, 2023, and finalizes the remaining needed amendments to the MATS rule on electronic reporting. Note that these amendments were developed after consideration of the comments received on the September 29, 2016, and April 10, 2020, proposals. III. What is the scope of these amendments?

This action amends the reporting requirements in 40 CFR 63.10031 of the MATS regulation, and, for consistency with those changes, amends related text in 40 CFR part 63, subpart UUUUU; specifically, 40 CFR 63.10000, 63.10005, 63.10009, 63.10010, 63.10011, 63.10020, 63.10021, 63.10030, 63.10032, 63.10042, and Tables 3, 8, and 9. In addition, the recordkeeping and reporting sections of appendices A and B are amended [2] and three new appendices are added to the rule, *i.e.,* appendices C, D, and E. Instead of using the electronic reporting tool (ERT) to submit some of the MATS data via CEDRI and submitting the remainder through the ECMPS Client Tool, as was required by the original MATS rule, this action allows EGU owners or operators to use the ECMPS Client Tool to report all of the required information in XML and PDF files.

IV. What are the specific amendments to 40 CFR part 63, subpart UUUUU as a result of this action?

The amendments to 40 CFR part 63, subpart UUUUU are discussed in detail in the paragraphs below.

A. Revisions to the Reporting Requirements of MATS

The reporting requirements of MATS are amended as follows:

(1) The ECMPS Client Tool is the exclusive data system for MATS reporting, in lieu of using both ECMPS and the CEDRI.

(2) The interim PDF reporting process described in 40 CFR 63.10031(f) is extended through December 31, 2023, to allow sufficient time for software development, programming, and testing. Until then, compliance with the emissions and operating limits will continue to be assessed based on the various PDF report submittals described in 40 CFR 63.10031(f) and data from Hg, HCl, HF, and SO_2 CEMS and sorbent trap monitoring systems, as reported through the ECMPS Client Tool. On and after January 1, 2024, compliance with the emissions and operating limits is assessed based on: (1) Quarterly compliance reports; (2) hourly data from all continuous monitoring systems (CMS) (including PM CEMS and PM CPMS) in XML format; (3) detailed reference method information for stack tests and CMS performance evaluations in XML format and PDF files; (4) Notifications of Compliance Status (if any) in PDF files; and (5) if applicable, supplementary data in PDF files for EGUs using paragraph 2 of the definition of startup in 40 CFR 63.10042. The ECMPS Client Tool is required to submit all of these reports and notifications.

(3) In order to properly close out the interim PDF reporting process, 40 CFR 63.10031(f)(6) states that PDF submittals are still accepted as necessary for the reports required under paragraph (f) introductory text, (f)(1), (2), or (4) if the deadlines for submitting those reports extend beyond December 31, 2023. As an example, the last semiannual compliance report under the interim PDF reporting process covers the period from July 1, 2023, through December 31, 2023; the deadline for submitting this report is January 30, 2024, and the report is submitted using the interim PDF reporting process.

(4) Revised paragraph (f)(2) of 40 CFR 63.10031 expands the quarterly reporting of 30- or 90-boiler operating day rolling average emission rates to include units monitoring Hg, HCl, HF, and/or SO_2 emissions, and units using emissions averaging. This change is consistent with 40 CFR 63.10031(f)(2) of the current rule, which requires quarterly reporting of 30-boiler operating day rolling averages for EGUs using PM CEMS, PM CPMS, and approved HAP metals CEMS. Therefore, starting with the first quarter of 2024, the 30- or 90-boiler operating day rolling averages (or, if applicable, rolling weighted average emission rates (WAERs) if emissions averaging is used) are reported quarterly in XML format for all parameters (including Hg, HF, HCl, and SO_2). However, instead of providing these rolling averages in separate, stand-alone reports, they are incorporated into the quarterly compliance reports required under 40 CFR 63.10031(g) (see section IV.A.(9) of this preamble, below).

(5) Revised paragraphs (a)(1), (2), and (5) of 40 CFR 63.10031 clarify the electronic reporting requirements for the Hg, HCl, HF, SO_2, and additional CMS. Specifically:

(i) Paragraph (a)(1) requires the electronic reporting requirements of appendix A to be met if Hg CEMS or sorbent trap monitoring systems are used.

(ii) Paragraph (a)(2) requires the electronic reporting requirements of appendix B to be met, with one important qualification, if HCl or HF monitoring systems are used. Until December 31, 2023, if PS 18 in part 60, appendix B is used to certify an HCl monitor and Procedure 6 in part 60, appendix F is used for on-going QA of the monitor, EGU owners or operators will temporarily report only data that the existing programming of ECMPS is able to accommodate, *i.e.,* hourly HCl emissions data and the results of daily calibration drift tests and RATAs; records are to be kept of all of the other required certification and QA tests and supporting data. The reason for this temporary, limited reporting is that PS 18 and Procedure 6 were not published until July 7, 2015; therefore, it was not possible to specify recordkeeping and reporting requirements for them in the original version of appendix B. Now that PS 18 and Procedure 6 have been finalized, this rule adds the necessary recordkeeping and reporting requirements, and the interim reporting for HCl will be discontinued as of January 1, 2024 (for further discussion, see section IV.C of this preamble).

(iii) Paragraph (a)(5) clarifies the electronic reporting requirements for the SO_2 CEMS and the additional monitoring systems under MATS. Sources currently reporting SO_2 mass emissions under the Acid Rain Program or Cross-State Air Pollution Rule already meet these requirements, except for paragraphs (a)(5)(iii)(C) and (E), which require, respectively, quarterly reporting of an hourly SO_2 emission rate data stream in units of the applicable MATS standard (*i.e.,* pounds per British thermal units (lb/MMBtu) or pounds per megawatt hours (lb/MWh)) and certification statements from the responsible official. Separate certification statements are required for the 40 CFR part 75 programs and MATS. (*Note:* For consistency with the changes described in items (i) through (iii), immediately above, 40 CFR 63.10031(f)(3) is removed and reserved).

(6) Paragraphs (b)(1) and (2) of 40 CFR 63.10031 are amended to recognize that some EGUs may have received extensions of their compliance date under 40 CFR 63.6(i)(4). References to

[2] In 2015, the EPA published a technology-neutral performance specification and associated QA test procedures for HCl monitors (see Performance Specification 18 (PS 18) and Procedure 6 in 80 FR 38628, July 7, 2015). That rule added certification and QA test requirements for sources electing to monitor HCl according to PS 18 and Procedure 6. This action requires the results of the appendix B certification and QA tests to be reported electronically for periods beginning on January 1, 2024.

postmark dates for submittal of semiannual compliance reports paragraphs are removed from paragraphs (b)(2) and (4); these reports currently are, and continue to be, submitted electronically through ECMPS as PDF files, until they are superseded by quarterly compliance reports, starting in the first quarter of 2024.

(7) The provision in 40 CFR 63.10031(b)(5), which allows affected EGU owners or operators to follow alternate submission schedules for semiannual compliance reports are discontinued when the interim PDF reporting period ends. When that interim PDF reporting period ends, the uniform submission schedule described in 40 CFR 63.10031(b)(1) through (4) is required for all affected EGUs, so that compliance with this reporting requirement can easily be tracked.

(8) New 40 CFR 63.10031(b)(6) will require EGU owners or operators to discontinue submission of semiannual compliance reports when the interim PDF reporting period ends. The final semiannual compliance report covers the period from July 1, 2023, through December 31, 2023.

(9) EGU owners or operators submit quarterly compliance reports in lieu of the semiannual compliance reports, starting with reports covering the first quarter of 2024 (see 40 CFR 63.10031(g)). The quarterly compliance reports retain many features of the semiannual reports and consolidate them with other reports that were originally required to be submitted separately on different schedules. These compliance reports will be due within 60 days after the end of each calendar quarter, which allows sufficient time to receive the results of stack tests (particularly PM, HCl, and HF tests) performed at or near the end of a calendar quarter. Each quarterly compliance report includes the applicable data elements listed in sections 2 through 13 of appendix E.

The owner or operator's MATS compliance strategy determines which of the data elements in sections 2–13 of appendix E are included in the quarterly compliance reports. If continuous emission monitoring were used to demonstrate compliance on a 30- or 90-boiler operating day rolling average basis, the quarterly compliance reports include all of the 30- or 90-day averages calculated during the quarter. If emissions averaging were used, EGU owners or operators report all of the 30- or 90-group boiler operating day WAERs calculated during the quarter. If periodic stack testing for compliance were performed (including Hg LEE tests and PM tests to set operating limits for PM CPMS), the EGU owner or operator reports a summary of each test completed during the calendar quarter and indicate whether the test has a special purpose (*i.e.,* if it were to be used to establish LEE status or for emissions averaging).

The quarterly compliance reports retain and incorporate the following features of the semiannual compliance reports: (1) Boiler tune-up dates; (2) monthly fuel usage data; (3) process and control equipment malfunction information; (4) reporting of deviations; and (5) emergency bypass information, for certain EGUs that qualify for and elect to use the LEE compliance option for Hg. However, for EGU owners or operators who elect to (or are required to) use CMS to demonstrate compliance, these quarterly reports, to some extent, move away from traditional ''exception only'' reporting. Currently, reporting of the excess emissions and monitor downtime information described in 40 CFR 63.10(e)(3)(v) and (vi) in PDF files has been required as part of the semiannual compliance reports. That information includes, among other things, identification of excess emissions periods, identification of periods when the monitoring system was inoperative or out of control, the reasons for the excess emission and monitor downtime periods, corrective actions or preventative measures taken, description of repairs or adjustments to inoperative or out-of-control CMS, the total amount of source operating time in the reporting period, and the excess emissions and monitor downtime, expressed as percentages of the source operating time. As explained above, rather than this traditional exception-only reporting, these amendments require all of the 30- (or 90-) boiler operating day rolling averages or WAERs for all parameters to be included in the quarterly compliance reports. In addition, the following elements of the excess emissions summary, with slight modifications, are included in the quarterly compliance reports: (1) The total number of source operating hours in the quarter and (2) the total number of hours of monitoring system downtime for various causes (known and unknown).

As previously noted, the requirement to report deviations is retained in the quarterly compliance reports. Specifically, the revisions to 40 CFR 63.10031(d) require the applicable data elements in section 13 of appendix E to be reported, which include the nature of the deviation (section 13.2), a description of the deviation (section 13.3), and any corrective actions taken (section 13.4). Section 13.3 further specifies the minimum amount of information reported in the description of certain deviations or monitoring downtime (*i.e.,* unmonitored bypass stack usage, emissions or operating limit exceedances, monitoring system outages, and missed or late performance stack tests).

We believe that consolidating information in quarterly compliance reports, as described above, rather than requiring separate submittals of 30- (or 90-) boiler operating day rolling average reports, excess emissions reports, and semiannual compliance reports that come in separately at different times during the year, greatly simplifies reporting and makes it easier for inspectors and auditors to assess compliance with the standards. Also, quarterly, as opposed to semiannual, reporting is advantageous because it shortens significantly the interval between the time that deviation or exceedance reporting on a term longer than quarterly occurs. Draft reporting instructions for the quarterly compliance reports are provided in the rule docket. In response to comments received, these instructions have been modified from a previous draft version.

(10) A new paragraph (c)(10) is added to section 63.10031 and requires malfunction information to be included in the semiannual compliance reports. This is not a new requirement; it was previously found in paragraph (g). However, as explained above, revised paragraph (g) requires quarterly compliance reports to be submitted, starting in 2024. Therefore, to avoid losing the requirement to report malfunction information in the semiannual compliance reports, the former paragraph (g) has been renamed as paragraph (c)(10) and is added to the list of information that must be included in the semiannual reports. The introductory text of paragraph (c) is also amended, to recognize the addition of paragraph (c)(10).

(11) For consistency with the reporting requirements for the other CMS, the regulation does not require source owners or operators using PM CPMS to submit separate quarterly excess emission summary reports in addition to the quarterly compliance reports. After careful consideration of comments on the previous proposal, we are persuaded that sufficient information to assess compliance with the operating limits of a PM CPMS will be provided by: (1) The hourly PM CPMS response data reported in appendix D; (2) the quarterly compliance reports, which specify the operating limit of the PM CPMS, require

deviations from the operating limit and monitoring requirements to be reported, and include summarized results of the PM tests used to develop the operating limits; and (3) the applicable reference method data for the PM tests required to be reported under sections 17–30 of appendix E.

Table 9 to 40 CFR part 63, subpart UUUUU is amended to reflect the transition away from exception-only reporting. The applicability of the recordkeeping and reporting requirements for excess emission and monitor downtime summary reporting in 40 CFR 63.7(c)(8), 63.10(c)(7), and 63.10(e)(3) ends on December 31, 2023, with the phase-out of the semiannual compliance reports.

(12) One commenter on the previous proposal brought to light some inconsistencies in the rule; regarding the way in which periods of monitor downtime should be regarded and reported, *i.e.,* whether or not they are reportable deviations. We thought the April proposal addressed this concern, but other commenters asked for clarification during the current comment period. As the Agency meant to exempt periods of routine QA or quality control (QC) and routine maintenance from deviation reporting but not from monitoring downtime reporting, language in 40 CFR 63.10010(h)(5), (i)(4), and (j)(4) has been clarified, along with the clarifications to 40 CFR 63.10020(b) and (d), 40 CFR 63.10010(h)(6)(i) and (ii), (i)(5)(i) and (ii), and (j)(4)(i)(A) and (B) that were proposed in April. We also clarified the corresponding data elements in section 13 of Appendix E.

In response to comments for clarification concerning reporting of QA test results, which the Agency maintains is mandatory for all CMS, the regulation has been amended at 40 CFR 63.10010 to remove the last sentence in paragraphs (h)(6)(i), (j)(4)(i)(A) and (B); to require the monitoring system performance evaluations of PM CPMS and HAP metals CEMS be reported in paragraphs (h)(7) and (j)(4)(ii), respectively; to require the QA/QC activities for PM CPMS and HAP metals CEMS be reported quarterly in PDF files in 40 CFR 63.10031(k); and to cross-reference the appropriate sections of appendix C, regarding the certification, operation, maintenance, on-going QA, recordkeeping, and reporting requirements for PM CEMS in 40 CFR 63.10010(i).

(13) In all cases in which periodic stack tests (including Hg LEE tests and PM tests that are used to develop PM CPMS operating limits) are performed to demonstrate compliance, the rule retains the requirement for the EGU owner or operator to provide the applicable reference method data in appendix E (*i.e.,* sections 17 *et. seq.*) for each stack test that is performed to demonstrate compliance. Each of these submittals is required to accompany the quarterly compliance report that covers the calendar quarter in which the test was completed. For PM tests that are used to develop PM CPMS operating limits, EGU owners or operators will be required to include the information in 40 CFR 63.10023(b)(2)(vi) as part of the Test Comment data element found in section 17.25 of appendix E.

(14) The applicable reference method data in sections 17 through 30 of appendix E will be required to be provided in XML format, starting with tests completed on or after January 1, 2024, for each RATA of an Hg, SO_2, HCl, or HF monitoring system, and for each RRA, RCA, or correlation test of a PM CEMS. The information in section 31 of appendix E is provided in a PDF file for each test. The appendix E information is submitted concurrently with the summarized electronic test results submitted to ECMPS under appendix A, B, or C, or 40 CFR part 75 (for SO_2 RATAs).

(15) The ECMPS Client Tool is also used to make the following submittals in PDF files:

(i) a detailed report of the current, active PS 11 correlation test, if the EGU owner or operator is using a certified PM CEMS to demonstrate compliance. For correlation tests completed prior to November 9, 2020, the report is due no later than 60 days after that date. For correlation tests completed on or after November 9, 2020, but prior to January 1, 2024, the report is due within 60 days after the date on which the test is completed. (*Note:* For correlations completed on and after January 1, 2024, in lieu of a PDF report, the test results are submitted electronically according to section 7.2.4 of appendix C, together with the applicable reference method data required under sections 17 through 31 of appendix E);

(ii) any initial Notification of Compliance Status issued on or after January 1, 2024; and

(iii) the information specified in 40 CFR 63.10031(c)(5)(ii) and 40 CFR 63.10020(e) for startup and shutdown incidents, if an EGU owner or operator is relying on paragraph (2) of the definition of startup in 40 CFR 63.10042. Starting with a report covering the first calendar quarter of 2024, this information is submitted along with the quarterly compliance report. Note that 40 CFR 63.10031(c)(5)(iii) through (v), which require the semiannual compliance reports to include the hourly CEMS and operating parameter data recorded during startup and shutdown events have not been carried over to this PDF report because this information is duplicative of the hourly data reported electronically in the quarterly emissions reports. Startup and shutdown hours are flagged in the emissions reports and are identifiable for auditing purposes.

(16) To accommodate the required PDF reports, the applicable data elements in 40 CFR 63.10031(f)(6)(i) through (xii) are entered into the ECMPS Client Tool at the time of submission of each PDF file. Note that the amendment to data element (xii) replaces the word ''conducted'' with the word ''completed.''

(17) Although the ECMPS Client Tool is used to submit the required reports and notifications described in revised 40 CFR 63.10031 and Table 8, ECMPS does not evaluate any of the PDF submittals or any of the XML-formatted reference method data from sections 17 through 31 of appendix E. Instead, these reports and notifications are transmitted directly through the EPA's Central Data Exchange using CEDRI unaltered. ECMPS does, however, perform electronic checking of the hourly PM CEMS data and the summarized RATAs, PM CEMS correlation tests, RRAs, and RCAs that are submitted in XML format, in a manner that is consistent with the way that certification and QA test results are evaluated under the Acid Rain and Cross-State Air Pollution Rule programs. ECMPS uses the results of these evaluations to assess the quality-assured status of the Hg, HCl, HF, SO_2, or PM emissions data. In addition, ECMPS performs basic checks of the information in the quarterly compliance reports, *e.g.,* checking for completeness and proper formatting, but leaves compliance assessment to those who review the reports. The EPA intends for all of these various data submissions to work together in a complementary fashion to enable meaningful compliance determinations. It is essential that any problems with the data identified by the reviewers are communicated to all involved and resolved appropriately. For example, if, for a particular Hg RATA, a review of the reference method data shows that the method was not done properly, the RATA would be invalidated. If, at the time of this discovery, the deadline for performing the RATA has passed and the allowable grace period has also expired, this improper RATA results in invalidation of hourly emissions data, from the expiration of the grace period until a valid RATA is performed and

passed. Consequently, resubmission of quarterly emissions reports, recalculation of 30-day compliance averages, and resubmission of quarterly compliance reports may become necessary.

B. Revisions to Appendix A

Based on comments received, six sections of appendix A, *i.e.,* sections 5.1.1, 7.1.1.2.1, 7.1.3.3, 7.1.4.3, 7.1.8.2 and 7.2.3.1 are amended and described, here. The requirement in section 5.1.1 regarding required QA testing is clarified to allow daily calibrations to be performed offline and to specify that ongoing QA testing other than RATAs can be performed at no particular load levels.

The requirement in section 7.1.1.2.1 for electronic reporting is expanded to include emission controls. As part of the re-examination of the list of data elements that compose a complete test report, suggested by commenters, this data element was found to be missing in this section. The requirement in sections 7.1.3.3, 7.1.4.3, and 7.1.8.2 to report Hg concentrations and emission rates to three significant figures is revised so that Hg concentrations in micrograms per standard cubic meter (µg/scm) and Hg emission rates in pounds per trillion British Thermal Units or pounds per gigawatt-hour are reported with one leading non-zero digit and one decimal place, in scientific notation. Conventional rounding is used, *i.e.,* if the digit immediately following the first decimal place is 5 or greater, the digit in the first decimal place is rounded upward (increased by one); if the digit immediately following the first decimal place is 4 or less, the digit in the first decimal place remains unchanged.

The requirement in section 7.2.3.1 to submit monitoring plan information at least 21 days before the applicable compliance date in 40 CFR 63.9984 is revised. For new EGUs or EGUs that install Hg monitoring systems in order to switch from another MATS-compliant methodology to Hg monitoring, the monitoring plan information is submitted at least 21 days prior to the date on which certification testing begins. However, for EGUs implementing Hg monitoring with a previously-certified Hg monitoring system, the monitoring plan may be submitted prior to or concurrent with the first quarterly emissions report—provided that the monitoring plan is in place when the first emissions report is submitted so that the ECMPS Client Tool is able to evaluate the data.

C. Revisions to Appendix B

For affected source owners or operators desiring to continuously monitor HCl emissions, the original version of appendix B required the monitoring system to be certified according to PS 15 in appendix B to 40 CFR part 60. However, PS 15 applies only to Fourier Transform Infrared (FTIR) Spectroscopy monitoring systems; therefore, the use of other viable HCl monitoring technologies was excluded. In view of this, the EPA regarded the requirement to use PS 15 exclusively as a temporary measure, until a technology-neutral PS for HCl monitors could be developed and published. In section 3.1 of appendix B, the Agency stated its intention to publish such a PS in the near future together with appropriate on-going QA requirements and to amend appendix B to accommodate their use. This additional PS, (PS 18 in 40 CFR part 60, appendix B), and the on-going QA test requirements (Procedure 6 in 40 CFR part 60, appendix F) were published on July 7, 2015 (80 FR 38628, July 7, 2015).

Now that technology-neutral certification and QA test requirements for HCl monitors are promulgated, EGU owners or operators may use any viable HCl monitoring technology that can meet PS 18. However, in order for ECMPS to accommodate all of the tests required under PS 18 and Procedure 6, additional time must be allotted for software development. In view of this, 40 CFR 63.10031(a)(2) is revised, as previously noted, to require only information that is compatible with the existing programming of ECMPS to be reported electronically through December 31, 2023; this includes hourly HCl emissions data and the results of daily calibration drift tests and RATAs. In the interim, EGU owners or operators are required to keep records of all of the other certification and QA tests, which would be reported starting in 2024.

The title to section 2.3 of appendix B is revised by deleting the reference to FTIR-only monitoring systems. In addition, the recordkeeping and reporting sections of appendix B (*i.e.,* sections 10 and 11) are amended. Based on comments received, sections 10.1.3.3 and 10.1.7.2, HCl and HF concentrations (µg/scm) and emission rates (lb/MMBtu or lb/MWh) are reported with one leading non-zero digit and one decimal place, in scientific notation, rather than reporting the concentrations and rates to three significant figures. Conventional rounding is used, *i.e.,* if the digit immediately following the first decimal place is 5 or greater, the digit in the first decimal place is rounded upward (increased by one); if the digit immediately following the first decimal place is 4 or less, the digit in the first decimal place remains unchanged. Sections 10 and 11 also specify the data elements that are recorded and reported for each of the tests required by PS 18 and Procedure 6. The revisions make a clear distinction between the tests required for FTIR monitors that are following PS 15 and the test requirements of PS 18 and Procedure 6. Some of the tests in PS 18 and Procedure 6 are similar to tests for which ECMPS programming exists. For example, the ''measurement error test'' required for initial certification of the HCl monitor is structurally the same as a 40 CFR part 75 linearity check. Other tests have no counterpart in 40 CFR part 75 and require special software development and reporting instructions. Note that electronic reporting of these tests through ECMPS would have been required if PS 18 and Procedure 6 had been in place when the original MATS rule was published. In view of this, for source owners or operators electing to use HCl CEMS, the amendments to section 11 of appendix B introduce no unnecessary reporting burden. The results of certification and on-going QA tests are reported electronically for all CEMS required under this rule in order for ECMPS to assess the quality-assured status of the emissions data. The Agency also notes that not all of the tests described in section 11 of appendix B are required for all HCl monitors. For example, some of the tests (*i.e.,* beam intensity, temperature, and pressure verifications) are specific to integrated path-CEMS, and Procedure 6 would offer a choice among three different types of audits (*i.e.,* cylinder gas audits, relative accuracy audits, or dynamic spiking audits) for the required quarterly QA tests. In addition, based on comments received, the reporting requirements for the interference check (which is not necessarily performed on each individual analyzer) are reduced.

For each RATA of HCl CEMS that are completed on and after January 1, 2024, the applicable reference method data in sections 17 through 31 of appendix E are submitted along with the electronic summary of results required under section 11 of appendix B. To the extent practicable, these data are submitted prior to or concurrent with the relevant quarterly electronic emissions report. However, as previously noted, this may not always be possible, particularly when the RATA is done near the end of a calendar quarter. The EPA test Methods 26 and 26A, unlike instrumental test methods, require

laboratory analyses of the collected samples and cannot provide test results while the test team is on-site. In view of this, section 11.4 of appendix B allows the test results to be submitted up to 60 days after the test completion date. ''Provisional'' status may be claimed for the emissions data affected by the test, starting from the date and hour in which the test is completed, and continuing until the date and hour in which the test results are submitted. If the test is successful, the status of the data in that time period change from provisional to quality-assured, and no further action is required. However, if the test is unsuccessful, the provisional data are invalidated, and resubmission of the affected emissions report(s) is required.

Because a technology-neutral PS for HCl CEMS was not available prior to April 16, 2015 (which was the compliance date for many of the existing EGUs), EGU owners or operators interested in monitoring HCl either had to use an FTIR system and follow PS 15 or implement another compliance option (*e.g.,* quarterly emission testing) while awaiting publication of PS 18 and Procedure 6. In light of this, section 11.5.1 of appendix B now clarifies when electronic reporting of hourly HCl emissions data begins. There are two possibilities. In the first case, the monitor is used for the initial compliance demonstration. This could either apply to a certified FTIR monitor following PS 15 or to a certified monitor following PS 18, if the owner or operator of the EGU received an extension of the compliance date. In this case, EGU owners or operators begin reporting hourly HCl emissions through ECMPS with the first operating hour of the initial compliance demonstration. In the second case, another option, such as stack testing, is used for the initial compliance demonstration and continuous monitoring is implemented at a later time. In that case, EGU owners or operators begin reporting hourly HCl emissions reporting through ECMPS with the first operating hour after successfully completing all required certification tests of the CEMS. In either case, the first quarterly emissions report submittal is for the calendar quarter in which emissions reporting begins.

The requirement in section 11.3.1 to submit monitoring plan information at least 21 days before the applicable compliance date in 40 CFR 63.9984 is revised. For new units or units that install HCl and/or HF monitoring systems in order to switch from another MATS-compliant methodology to HCl and/or HF monitoring, the monitoring plan information must be submitted at least 21 days prior to the date on which certification testing begins. However, for units implementing HCl and/or HF monitoring with a previously-certified monitoring system, the monitoring plan may be submitted prior to or concurrent with the first quarterly emissions report.

Section 11.4.13 clarifies the reporting requirements for stack gas flow rate, moisture, and diluent gas monitoring systems that are used for certification, recertification, diagnostic, and QA tests are from section 10.1.8.2 of this appendix; such systems are also certified and quality-assured according to 40 CFR part 75 of this chapter.

D. Addition of Appendix C

A new appendix, *i.e.,* appendix C, is added to subpart UUUUU of 40 CFR part 63. Appendix C sets forth the continuous monitoring and reporting requirements for filterable PM. Appendix C is structurally similar to appendices A and B, but there is one notable difference. Appendix C includes provisions for installation and certification of the PM CEMS, and for on-going QA of the data from the CEMS. The monitoring system is certified according to PS 11 in 40 CFR part 60, appendix B, and for the on-going QA tests, Procedure 2 to 40 CFR part 60, appendix F is being required.

After consideration of comments received, the EPA has concluded that all PM concentrations will be reported in units of measure that are consistent with the PM CEMS correlation. For example, if the PM CEMS measures in units of milligrams per actual cubic meter (mg/acm) and the concentrations used to derive the correlation curve are in those same units, then the hourly PM concentrations are recorded and reported in mg/acm. Section 7.1.9.5 of appendix C also requires the reference method readings and the PM CEMS responses obtained in the RRAs and RCAs to be reported in the same units of measure as the PM CEMS correlation curve.

Sections 7.1.3.3 and 7.1.7.2 require PM concentrations and emission rates (lb/MMBtu or lb/MWh) to be reported with one leading non-zero digit and one decimal place, in scientific notation, rather than reporting the concentrations and rates to three significant figures. Conventional rounding is used, *i.e.,* if the digit immediately following the first decimal place is 5 or greater, the digit in the first decimal place is rounded upward (increased by one); if the digit immediately following the first decimal place is 4 or less, the digit in the first decimal place remains unchanged.

The frequencies for the on-going QA tests and the rules for data validation are presented in section 5 of appendix C. In response to numerous requests from commenters, the frequency and data validation rules for the RCAs and RRAs are similar, but not identical to, provisions of 40 CFR part 75. The frequency of these tests follows the familiar calendar quarter and grace period reporting plan. An RRA is required once every 4 calendar quarters and an RCA is required once every 12 calendar quarters. A grace period is provided (*i.e.,* 720 operating hours or 1 calendar quarter, whichever comes first), to cover cases where circumstances beyond the control of the owner or operator prevent the required test from being completed on schedule. In addition, as explained in detail below, section 7.2.4 of appendix C allows the use of provisional data for up to 60 days after completion of an RRA, RCA, or PM CEMS correlation test.

The procedures for calculating the PM emission rates in units of the emission standard are found in section 6. These calculation methods are basically the same as those used for Hg monitoring systems and for HCl and HF CEMS in appendices A and B. The recordkeeping and reporting requirements are found in section 7. Section 7.1 requires monitoring plan records and hourly records of operating parameters, PM concentration, diluent gas concentration, stack gas flow rate and moisture content, and PM emission rates are kept. Sections 7.2.3 and 7.2.4, respectively, require monitoring plan information and the results of certification, recertification, and QA tests are reported electronically. For consistency with these revisions to appendices A and B, section 7.2.3.1 specifies that for new units or units installing PM CEMS in order to switch from another MATS-compliant methodology to PM monitoring, the electronic monitoring plan information is submitted at least 21 days prior to the commencement of certification testing. However, for EGUs with previously-certified PM CEMS that elect to implement PM monitoring, the monitoring plan information may be submitted prior to or concurrent with the first quarterly emissions report. Section 7.2.5 requires quarterly electronic emissions reports are submitted within 30 days after the end of each calendar quarter. All electronic reports are submitted using the ECMPS Client Tool. However, for EGUs that began using the PM CEMS compliance option prior to January 1, 2024, electronic reporting of monitoring plan information, certification and on-going QA test results, hourly PM emissions

data, and the applicable reference method data in appendix E does not begin until January 1, 2024, to allow time for software development and beta testing. Until then, records of the required information and tests are kept. For EGUs that certify and begin using PM CEMS on or after January 1, 2024, reporting of hourly PM emissions data begin with the first operating hour after successful completion of the initial PM CEMS correlation test.

For PM CEMS correlations, RRAs, and RCAs completed on and after January 1, 2024, the applicable reference method data in sections 17 through 31 of appendix E are submitted along with the electronic test summary required under section 7.2.4 of appendix C. To the extent practicable, the electronic test results and the appendix E reference method data are submitted prior to or concurrent with the relevant quarterly electronic emissions report. However, the EPA recognizes that this is not always possible, particularly when an RRA or RCA is done near the end of a calendar quarter. The EPA test Methods 5 and 5D, unlike instrumental test methods, require laboratory analyses of the collected samples and generally cannot provide test results while the test team is on-site. In view of this, section 7.2.4 of appendix C allows the test results to be submitted up to 60 days after the test completion date. ''Provisional'' status may be claimed for the emissions data affected by the test, starting from the date and hour in which the test is completed, and continuing until the date and hour in which the test results are submitted. If the test is successful, the status of the data in that time period changes from provisional to quality-assured, and no further action is required. However, if the test is unsuccessful, the provisional data would be invalidated, and resubmission of the affected emission report(s) is required.

E. Addition of Appendix D

A new appendix, *i.e.,* appendix D, is added to subpart UUUUU of 40 CFR part 63. Appendix D sets forth the monitoring and reporting requirements for EGU owners or operators who elect to use a PM CPMS to demonstrate continuous compliance. Structurally, appendix D is similar to appendices A, B, and C. However, the criteria for system design and performance, the procedures for determining operating limits, data reduction, and compliance assessment, and certain recordkeeping requirements are not detailed in the appendix; rather, the applicable sections of the MATS rule are cross-referenced (see sections 2.1 through 2.4, 3.1 introductory text, and section 3.1.1.1 of the appendix).

Section 3.1.1.2 requires the ECMPS Client Tool to be used to create and maintain an electronic monitoring plan. The PM CPMS is defined as a monitoring system with a unique system ID number. The monitoring plan also includes the current operating limit (with units of measure), the make, model, and serial number of the PM CPMS, the analytical principle of the monitoring system, and monitor span and range information.

The rule requires operating parameter records for each hour of operation of the affected EGUs, including the date and hour, the EGU or stack operating time, and a flag to identify exempt startup and shutdown hours. Hourly average PM CPMS output values are reported for each hour in which a valid value of the output parameter is obtained, in units of milliamps, PM concentration, or other units of measure, including the instrument's digital signal output equivalent. A special code is required to indicate operating hours in which valid data are not obtained. The percent monitor data availability is calculated in the manner established for SO_2, carbon dioxide (CO_2), oxygen (O_2), or moisture monitoring systems in 40 CFR 75.32.

Sections 3.2.2 and 3.2.3, respectively, require notifications (provided in accordance with 40 CFR 63.10030) and electronic monitoring plan submittals at specified times. For EGUs using the PM CPMS compliance option prior to January 1, 2024, the electronic monitoring plan information is submitted prior to or concurrent with the first quarterly report. For EGUs switching to the PM CPMS compliance option on or after January 1, 2024, the electronic monitoring plan is submitted no later than 21 days prior to the PM test that establishes the initial operating limit. Section 3.2.4 requires the electronic quarterly reports to be submitted within 30 days after the end of each calendar quarter. Reporting of hourly responses from the PM CPMS begins either with the first operating hour of 2024 or the first operating hour after completion of the stack test that establishes the initial operating limit, whichever is later. Each quarterly report includes a compliance certification with a statement by a responsible official that to the best of his or her knowledge, the report is true, accurate, and complete.

In addition to the electronic quarterly reports, the rule requires reporting of deviations from the operating limit in the quarterly compliance reports required under 40 CFR 63.10031(g). Further, section 3.2.5 of appendix D requires the results of each performance stack test for PM that is used to establish an operating limit are reported electronically in the relevant quarterly compliance report. For PM tests completed on and after January 1, 2024, the applicable appendix E reference method data are also submitted along with the relevant quarterly compliance report.

F. Addition of Appendix E

A new appendix, *i.e.,* appendix E, is added to subpart UUUUU of 40 CFR part 63. Sections 2 through 13 of appendix E list the data elements that are reported in XML format in the quarterly compliance reports required under 40 CFR 63.10031(g), starting with reports covering the first quarter of 2024.

The MATS compliance strategy (*e.g.,* whether the EGU owner or operator elects to perform periodic stack testing, continuous monitoring, or to use emissions averaging) and the events that occur during each calendar quarter determine which data elements in sections 2 through 13 are included in the quarterly compliance reports. As noted in section V.A.(9) of this preamble, updated reporting instructions for these compliance reports are found in the rule docket.

For reasons stated in the previous proposal's Response to Comments document (which is available in the rule docket [3]), the basic provisions of sections 14 through 21 of appendix E, requiring details of the reference methods used for performance stack tests and CMS performance evaluations are reported in XML format are retained. The rule also retains the requirement in section 22 of appendix E to provide reference method test information that is incompatible with electronic reporting as PDF files, although it has been renumbered as section 31 and modified to include a cross-reference to 40 CFR 63.7(g), which describes the contents of a performance test report. The applicable reference method information in appendix E is provided for each stack test; each RATA of a Hg, HCl, HF, or SO_2 monitoring system; and each RRA, RCA, or correlation test of a PM CEMS that is completed on and after January 1, 2024.

To address concerns raised by the commenters about portions of the 2016 proposed rule [4] (the previous proposal), specifically, the reporting requirements in sections 17 through 21 of proposed appendix E, the data element lists are

[3] See EPA–HQ–OAR–2018–0794 at *https://www.regulations.gov/.*

[4] As mentioned in footnote 1, see 81 FR 67062, September 29, 2016.

revised and reformatted to correspond to the compliance options described in section 16 of appendix E. Explicitly, sections 17 through 30 replace previously proposed sections 17 through 21. Commenters pointed out, and the Agency concurs, that some of the previously proposed data elements are either unnecessary, inapplicable to MATS, or duplicative of information in other MATS reports; these elements have been removed from the lists and include:

- Previously proposed 7.1.3.3.1 of appendix C to this subpart;
- Previously proposed 7.1.3.3.2 of appendix C to this subpart;
- Previously proposed 7.1.3.3.3 of appendix C to this subpart;
- Previously proposed 7.1.3.4 of appendix C to this subpart;
- Previously proposed 10.4 of appendix E to this subpart;
- Previously proposed 10.5.1 of appendix E to this subpart;
- Previously proposed 10.5.2 of appendix E to this subpart;
- Previously proposed 10.5.7 of appendix E to this subpart;
- Previously proposed 17.28 of appendix E to this subpart;
- Previously proposed 17.30 of appendix E to this subpart;
- Previously proposed 17.37 of appendix E to this subpart;
- Previously proposed 18.21 of appendix E to this subpart;
- Previously proposed 19.29 of appendix E to this subpart;
- Previously proposed 20.4 of appendix E to this subpart;
- Previously proposed 20.15 of appendix E to this subpart;
- Previously proposed 20.17 of appendix E to this subpart;
- Previously proposed 20.21 of appendix E to this subpart;
- Previously proposed 20.25 of appendix E to this subpart;
- Previously proposed 20.30 of appendix E to this subpart;
- Previously proposed 20.36 of appendix E to this subpart;
- Previously proposed 20.37 of appendix E to this subpart;
- Previously proposed 20.41 of appendix E to this subpart;
- Previously proposed 20.42 of appendix E to this subpart;
- Previously proposed 20.44 of appendix E to this subpart;
- Previously proposed 20.46 of appendix E to this subpart;
- Previously proposed 20.52 of appendix E to this subpart;
- Previously proposed 21.14 of appendix E to this subpart; and
- Previously proposed 21.28 of appendix E to this subpart.

Reporting instructions for sections 17 through 30 have been developed. These draft example instructions are included in the rule docket.

The reorganized data element lists and corresponding instructions clarify which data elements are reported for each compliance option and explain how the data are reported. Several new data elements are in the lists, to enable the ECMPS Client Tool to be used, to enhance the quality of the data, and to facilitate compliance. As mentioned in VI.C of this preamble, this action is expected to reduce overall annual source burden. The Agency believes that the addition of these data elements is offset by the removal of others, the change to a consistent submission frequency, and the merger of separate electronic reporting systems into just one electronic reporting system such that overall annual source reporting burden is reduced by 11,000 hours. The new data elements to be reported are as follows:

- ''Part.'' The previous proposal would only have required the ''Subpart'' to be reported. To avoid any possible confusion with other EPA regulations, both the CFR part (63) and subpart (UUUUU) need to be included in the reports.
- ''APS Flags.'' For 3-level pre-test calibrations, system bias, and drift checks, instrumental EPA test Methods 3A and 6C require certain acceptance criteria to be met. For each of these tests, there is a main PS and an alternative specification. The main PS is expressed as a percentage of span, while the alternative specification is the absolute difference between a reference value and the measured value. In view of this, it is important to know which specification has been applied to ascertain whether the test was successful or not. Therefore, alternative performance specification (APS) flags are to be added for the pre- and post-test calibrations, bias checks, and drift checks. An APS flag of ''0'' indicates that the reported test result is based on the main PS, whereas an APS flag of ''1'' means that the reported result is based on the APS.
- ''Test Comment.'' This text field is added to allow the affected sources to provide additional, pertinent information about a particular test.
- ''Run Begin Date'' and ''Run End Date.'' These two data elements replace the previous proposed element, ''Run Date,'' to cover cases where a test run begins on one day and ends on another (*e.g.,* if a run begins late at night and ends early the next morning).
- ''Converted Concentration and Units of Measure.'' These data elements apply to correlation tests and performance audits (RRAs and RCAs) of PM CEMS. The reference method used for these tests is EPA test Method 5 (or, if applicable, 5D). The PM concentrations obtained from EPA test Method 5 or 5D are expressed in units of grams per dry standard cubic meter (g/dscm). However, consistent with section 8.6 of PS 11, appendix C of MATS requires all PM concentrations to be reported in units of measure that are consistent with the PM CEMS correlation curve. Most PM CEMS measure concentration in units of milligrams per actual cubic meter (mg/acm); others may measure at a certain temperature (*e.g.,* mg/acm at 160 degrees Celsius), and still others may measure on a dry basis. Therefore, in addition to reporting the EPA test Method 5 test results in units of g/dscm, the converted PM concentrations must be reported in units consistent with the PM CEMS correlation curve.
- ''Average Sampling Rate and Units of Measure.'' These data elements are specific to EPA test Method 30B. That EPA test Method 30B requires a post-test leak check of each sampling train. The leakage rate must not exceed 4 percent of the average sampling rate. Therefore, to assess compliance with this specification, both the leakage rate and the average sampling rate must be reported. The previous proposed rule only required the leakage rate to be reported.
- ''Control Device Code.'' This data element refers to the control device code or control technology National Emission Inventory code associated with the EGU (or group of EGUs sharing a common stack). Providing this data element helps in EGU categorization and emission factor development.
- ''Corresponding Reference Method(s), if applicable.'' This data element allows pollutant reference method run data to be associated with concurrent measurements of the stack gas flow rate using EPA test Method 2, and/or CO_2 or O_2 concentration using EPA test Method 3A, and/or stack gas moisture content using EPA test Method 4. Reporting this data element is necessary to ensure test methods were conducted properly so that emission rates can be calculated.
- ''Corresponding Reference Method(s) Run Number, if applicable.'' This data element provides the run number of concurrent reference method tests. The assigned run number of the EPA test Method 1 through 4 or EPA test Method 3A tests conducted at the same time as a reference method test needs to be reported in order to ensure the

methods were conducted properly so that emission rates can be calculated.

• ''Pollutant Concentration Units of Measure.'' This data element provides the appropriate units of measure code for the pollutant or analyte concentration, and reporting it is necessary for comparison to the standard.

• ''Pollutant Emission Rate.'' This data element is the pollutant emission rate expressed in the units of the standard, and reporting it is necessary for comparison with the standard.

• ''Pollutant Emission Rate Units of Measure (in units of the standard).'' This data element is the units of the standard specified in Table 1 or 2 of this subpart. Reporting it is necessary for comparison to the standard.

• ''Process Parameter Units of Measure.'' This data element identifies the process rate parameter unit of measure: GWh/h, MWh/h, TBtu/h, or MMBTU/h, and reporting it is necessary to ensure accurate comparisons between runs and for emission factor development purposes.

• ''Total Pollutant Mass Trap A'' and ''Total Pollutant Mass Trap B.'' These data elements refer to the total Hg mass measured by Train A and Train B, respectively, in the appropriate units of measure. Reporting these values is necessary for QA purposes and for comparison with the standard.

• ''Method Detection Limit (MDL).'' This data element refers to the minimum amount of analyte that can be detected and reported. Reporting it is necessary for calculation checks and for emissions factor development purposes.

• ''Percent Spike Recovery.'' This data element refers to the spike recovery in percent, which is required to be reported by section 8.2.6.2 in EPA test Method 30B using Equation 30B–1.

• ''F-Factor (F_c).'' This data element expands the current F-factor choices to include the carbon F-Factor, which is based on the ratio of CO_2 to heat content of fuel. Reporting it allows conversion from mass per volume to mass per heat input for those who choose to use emissions testing.

• ''Compliance Limit Basis (Heat Input or Electrical Output).'' This data element identifies the denominator of the compliance units selected for an existing EGU by its owner or operator. Reporting this decision is necessary for comparison of results with the standard.

• ''Heat Input or Electrical Output Unit of Measure.'' This data element specifies the denominator of the compliance unit that corresponds to the means of compliance selected for an existing EGU by its owner or operator. Reporting this unit is necessary for comparison of results with the standard and for emission factor development purposes.

• ''Pollutant Concentration.'' This data element expands the already-existing ''Emissions Concentration'' data element to include pollutants. Reporting this data element is necessary for comparison of results with the standard and for emission factor development purposes.

• ''Stack Gas Flow Rate—dscfm.'' This data element clarifies the already-existing ''Volumetric Flow Rate—scfm'' data element so that reporters will know to report their EGU's dry stack gas flow rate. Reporting this data element is necessary for calculation purposes.

Several commenters [5] on the September 29, 2016, proposed rule (*i.e.,* the previous proposal) suggested that those proposed revisions included a significant amount of duplicative reporting, which should be eliminated. In response to the concerns expressed by the commenters, the Agency examined the XML data element lists twice—once in 2016 and recently after closure of the current comment period—for stack tests and CMS performance evaluations, in order to identify duplicative reporting and eliminate it where possible. The following evaluations were made:

First, the data elements in sections 2 through 13 of appendix E (for the quarterly compliance reports) were compared against the data elements in sections 17 through 30 of appendix E (corresponding to the detailed reference method data for stack tests and CMS performance evaluations). The two lists were found to have 20 data elements in common, but at least nine of these elements (*i.e.,* Source ID (Sampling Location), Test Number, Run Number, Run Begin Date, and a few others) are to be included in both XML schemas to properly link the individual stack test summaries in the compliance report with the corresponding reference method data.

Second, the data elements listed in the reporting sections of appendices A, B, and C of MATS, requiring the results of CMS performance evaluations (*i.e.,* RATAs, RRAs, and RCAs) to be reported using the ECMPS Client Tool, were compared against the corresponding reference method data elements in sections 17 through 30 of appendix E. Only 12 data elements common to the appendix E and ECMPS Client Tool schemas were found. This is not surprising because appendices A, B, and C require only summarized results of CMS performance evaluations—details of the Reference Method tests are not reported. Of the 12 data elements common to the appendix E and ECMPS lists, 10 of them are to be included in both schemas to properly link the CMS test summaries with the corresponding reference method data.

In view of these two evaluations, the EPA concludes that most of the duplicative reporting found among the various data element lists is necessary to ensure that the results of stack tests and CMS performance evaluations summarized in the quarterly compliance reports and the QA test submittals to the ECMPS Client Tool can be matched with the corresponding reference method data. Further, the remainder of the duplicative reporting is minimal, rather than ''significant'' as asserted by some commenters. The Agency believes that it is best not to modify the data element lists to eliminate this small amount of duplicate reporting. Although the deadlines for submitting the quarterly compliance reports and the corresponding reference method data are the same (*i.e.,* within 60 days after the end of the quarter), the two XML reports might not be submitted concurrently. So, if, for instance, the compliance report is submitted prior to the reference method data, and certain data elements are found only in the reference method report, a thorough assessment of compliance may not be possible until the reference method report is received. Similar considerations apply to the summarized CMS performance evaluations in the ECMPS Client Tool and the corresponding reference method data, if the two XML reports are not submitted concurrently.

V. Revisions to Other Rule Text

The revisions to 40 CFR 63.10031 necessitate changes to other sections of the rule to ensure that the rule is internally consistent. Based on comments received, revisions were made to clarify certain reporting requirements, to rectify inadvertent omissions, and to correct inconsistencies. The affected rule sections are as follows:

(a) The introductory text of paragraphs (a)(2), (b), and (h)(3)(iii) of 40 CFR 63.10005 is revised. The amendment to paragraph (a)(2) clarifies that Hg compliance may either be determined on either a 30- or 90-boiler operating day rolling average basis. For consistency with appendix E, revised paragraph (b) notes that when auxiliary stack gas flow rate or moisture data are needed to supplement a performance stack test conducted with an isokinetic

[5] Commenters 20612, 20597, and 20609 on Docket ID No. EPA–HQ–OAR–2009–0234.

method such as EPA test Method 5 or EPA test Method 26A, separate EPA test Method 2 or EPA Method 4 tests are not needed to satisfy the requirements of 40 CFR 63.10007 and Table 5. Data from the isokinetic method may be used to determine the stack gas flow rate and moisture content. Revised section (h)(3)(iii) addresses a commenter's request for clarification on how to calculate a 30-day Hg LEE test average.

(b) Section 40 CFR 63.10009 is amended as follows. The second and third sentences in paragraph (a)(2) are revised to clarify the types of data that may be used to determine WAERs. Data from Hg CEMS, sorbent trap monitoring systems, but not LEE tests, may be used for Hg emissions averaging. For other pollutants, both CEMS data and stack test data may be used. The last sentence of paragraph (a)(2) is amended to clarify that if any EGU in an averaging group operates on *any* of the days in a 30- or 90-group boiler operating day compliance period (regardless of how many or how few), the emissions data from that EGU on those days must be included in the weighted average. Since averaging of Hg emissions is permitted on a 30-group boiler operating day basis, Equations 2a and 2b in 40 CFR 63.10009 apply to Hg as well as other pollutants. Therefore, the words ''for pollutants other than Hg'' are removed from the introductory text of paragraph (b)(2), and in the nomenclature of Equation 2a, the words ''or sorbent trap monitoring'' are added after the words ''unit i's CEMS'' in the definition of the term ''Her_i.'' Finally, for completeness, Equations 3a and 3b are amended by removing the terms that pertain to quarterly stack testing. Equations 3a and 3b apply *only* to the 90-group boiler operating day Hg WAER limit for coal-fired units. Coal-fired EGUs do not have the option to use quarterly stack testing to demonstrate compliance; if a coal unit does not qualify as a LEE, Hg emissions must be continuously monitored.

(c) As explained in section IV.A(11) above, paragraphs (h)(6) and (7), (i), (j)(4)(i), and (j)(4)(ii) of 40 CFR 63.10010 are revised to resolve inconsistencies in the text.

(d) Section 40 CFR 63.10011(e) is revised to require Notifications of Compliance Status for initial compliance demonstrations include the information specified in 40 CFR 63.10030(e), and are submitted in accordance with 40 CFR 63.10031(f)(4) or 40 CFR 63.10031(h), as applicable. This change is necessary to cover initial Notifications of Compliance Status for both new and existing EGUs. The interim reporting process described in 40 CFR 63.10031(f)(4) and the on-going reporting process in 40 CFR 63.10031(h) require these Notifications to be submitted as PDF files, through ECMPS.

(e) Sections 40 CFR 63.10011(g)(3), 40 CFR 63.10021(i), and two sentences in Items 3 and 4 of Table 3 are revised to be consistent with 40 CFR 63.10031(i) and Table 8. For EGU owners or operators relying on paragraph (2) of the definition of startup in 40 CFR 63.10042, 40 CFR 63.10031(i) retains the requirement for the parametric data and other information in 40 CFR 63.10031(c)(5) be included in the semiannual compliance reports, for startup and shutdown incidents that occur during the interim reporting period. However, in view of the phase-out of the semiannual compliance reports, for startup and shutdown incidents that occur during each subsequent calendar quarter, starting with the first quarter of 2024, the supplementary information in 40 CFR 63.10031(c)(5)(ii) and 40 CFR 63.10020(e) is required to be provided as a separate PDF submittal, along with the quarterly compliance report. As previously noted, the requirements in 40 CFR 63.10031(c)(5)(iii), (iv), and (v) to report hourly average CEMS and operating parameter values for startup and shutdown events are not incorporated into this PDF report because they are duplicative of the hourly values reported under appendices A through D. Startup and shutdown hours are flagged in the quarterly emissions reports and can be identified for auditing purposes.

(f) Paragraphs (e)(9), (f), and (h)(3) of 40 CFR 63.10021 are revised as follows. Paragraph (e)(9) is unchanged from the previous proposal, except that the December 31, 2017, and January 1, 2018, transition dates are replaced with December 31, 2023, and January 1, 2024, respectively. References to the EPA's ERT and the CEDRI interface from paragraph (f) are removed and replaced with a general statement requiring all applicable notifications and reports be submitted through the ECMPS Client Tool. Three statements are added at the end of paragraph (f). The first statement, regarding a submission deadline that occurs on a weekend or Federal holiday, extends the deadline to the next business day. The second statement addresses a submission deadline that occurs when the ECMPS system is offline for maintenance; in that case, the deadline is extended until the first business day after the system outage. The third statement clarifies that using the ECMPS Client Tool to submit a required MATS report or notification satisfies the requirement in 40 CFR 63.13 of the General Provisions to submit that same report or notification (or the information contained in it) to the appropriate EPA Regional office or state agency whose delegation request has been approved. Finally, we are removing paragraph (h)(3) because it is redundant with paragraph (i) and, therefore, unnecessary.

(g) Previous section 40 CFR 63.10030(e)(7)(i) is removed for the following reasons. The requirement in the current rule for an initial Notification of Compliance Status to include summarized results of annual and triennial performance tests which have not been done yet is in an incorrect location. The requirement to submit these test summaries belongs in 40 CFR 63.10031, not 40 CFR 63.10030. Text similar to 40 CFR 63.10030(e)(7)(i) does, in fact, exist in 40 CFR 63.10031. Specifically, 40 CFR 63.10031(c)(7) requires the annual and triennial test results be summarized in the semiannual compliance reports. Note, however, that when the semiannual compliance reports are phased out in 2024, the requirement to provide summarized results of these tests does not end; the test summaries must be included in the quarterly compliance reports under 40 CFR 63.10031(g).

The requirements of section 40 CFR 63.10030(e)(7)(iii) are amended to rectify an inadvertent oversight. In the 2016 Technical Corrections rule package, the EPA proposed a set of conditions that would allow an EGU owner or operator to submit a request for permission to switch from a heat input-based standard to an output-based standard. One of the proposed conditions in paragraph (e)(7)(iii)(A)(*3*) required a demonstration of compliance with both emission limits based on ''performance stack test results completed within 30 days prior to'' the request. A commenter objected to limiting this demonstration to ''stack test'' data and asked the EPA to allow any data collected up to 45 days prior to the request, including CEMS data, be used. In the Response to Comments document, the EPA agreed with these commenters, but did not make the necessary changes to paragraph (e)(7)(iii)(A)(*3*) in the final rule. This rule corrects this oversight. In addition, a note is added to paragraph (e)(7)(iii) to clarify that requests to switch from one standard to the other are made subsequent to, and are not part of, the initial Notification of Compliance Status.

(h) The requirements of 40 CFR 63.10032(a) are amended to include references to the recordkeeping required under new appendices C (for PM

CEMS), D (for PM CPMS), and E (for quarterly compliance reports and reference method test data). Also, in view of the move away from semiannual compliance reporting to quarterly reporting, the term ''semiannual compliance report'' is replaced with references to both semiannual and quarterly compliance reports in paragraph (a)(1).

(i) The words ''or out of control period'' are removed from the definition of ''monitoring system malfunction or out of control period'' in 40 CFR 63.10042 because that definition does not describe an out of control period. A separate definition of ''out-of-control period'' is added, and that definition is similar with the definition provided in the Acid Rain Program definitions at 40 CFR 72.2.

(j) Table 8 to subpart UUUUU of 40 CFR part 63 is revised to be consistent with the amendments to 40 CFR 63.10031 and the proposed addition of appendices C, D, and E.

(k) Finally, the recordkeeping and reporting requirements in Table 9 to 40 CFR part 63, subpart UUUUU are revised as follows. First, the requirement to provide the information in 40 CFR 63.10030(e)(1) through (8) is clarified, *i.e.,* it only applies to *initial* Notifications of Compliance Status; subsequent notifications are not required. Second, in keeping with the earlier discussion provided in section IV.A of this preamble, a statement clarifying that the excess emissions recordkeeping and reporting requirements of 40 CFR 63.10(c)(7) and (8) and 63.10(e)(3)(v) and (vi) apply through December 31, 2023, when the semiannual compliance reports are phased out, is added. On and after January 1, 2024, all relevant information is provided in quarterly, as opposed to semiannual, reports.

VI. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at *https://www.epa.gov/laws-regulations/laws-and-executive-orders.*

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is not a significant regulatory action and was, therefore, not submitted to the Office of Management and Budget (OMB) for review.

B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs

This action is considered an Executive Order 13771 deregulatory action. Details on the estimated cost savings of this final rule can be found in the EPA's analysis of the potential costs and benefits associated with this action.

C. Paperwork Reduction Act (PRA)

The information collection activities in this rule have been submitted for approval to OMB under the PRA. The Information Collection Request (ICR) document that the EPA prepared has been assigned EPA ICR number 2137.10. You can find a copy of the ICR in the docket for this rule, and it is briefly summarized here. The information collection requirements are not enforceable until OMB approves them.

This rule continues to require collection, recording, and submission of data pertinent to demonstrating compliance with rule requirements. This action consolidates separate reporting systems into one reporting system by 2024; maintains the information already required to be collected, recorded, and submitted; and changes the submission frequency from semiannual to quarterly while consolidating the number and type of reports to be submitted.

Respondents/affected entities: The respondents are owners or operators of fossil fuel-fired EGUs. The United States Standard Industrial Classification code for respondents affected by the rule is 4911 (Electric Services). The corresponding NAICS code is 2211100 (Electric Power Generation, Transmission, and Distribution).

Respondent's obligation to respond: Mandatory per 42 U.S.C. 7414 *et seq.*

Estimated number of respondents: 1,414.

Frequency of response: Quarterly for compliance reports.

Total estimated burden: 273,000 hours (per year). Burden is defined at 5 CFR 1320.3(b).

Total estimated cost: Savings of $15,079,000 (per year), includes $0 annualized capital or operation and maintenance costs.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations in 40 CFR are listed in 40 CFR part 9. When OMB approves this ICR, the Agency will announce that approval in the **Federal Register** and publish a technical amendment to 40 CFR part 9 to display the OMB control number for the approved information collection activities contained in this final rule.

D. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. In making this determination, the impact of concern is any significant adverse economic impact on small entities. An agency may certify that a rule will not have a significant economic impact on a substantial number of small entities if the rule relieves regulatory burden, has no net burden, or otherwise has a positive economic effect on the small entities subject to the rule. For purposes of assessing the impacts of this rule on small entities, the EPA considered small entities to be defined as: (1) A small business that is an electric utility producing 4 billion kilowatt-hours or less as defined by NAICS codes 221122 (fossil fuel-fired electric utility steam generating units) and 921150 (fossil fuel-fired electric utility steam generating units in Indian country); (2) a small governmental jurisdiction that is a government of a city, county, town, school district, or special district with a population of less than 50,000; and (3) a small organization that is any not-for-profit enterprise which is independently owned and operated and is not dominant in its field. As required by the RFA, the EPA proposed using this alternative definition in the **Federal Register** of May 3, 2011, 76 FR 25083, sought public comment, consulted with the Small Business Administration and finalized the alternative definition in the **Federal Register** of February 16, 2012, 77 FR 9433. As stated in that document, the alternative definition would apply to this regulation. This action reduces annual burden on small and large entities. We have, therefore, concluded that this action will relieve regulatory burden for all directly regulated small entities.

E. Unfunded Mandates Reform Act (UMRA)

This action does not contain an unfunded mandate of $100 million or more as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. As described earlier, this action reduces annual burden on governments already subject to MATS; as a result, we have determined that this action will not result in any ''significant'' adverse economic impact for small governments.

F. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications as specified in Executive Order 13175. As described earlier, this action has no substantial direct effect on Indian tribes already subject to MATS, since this action reduces their annual burden. Thus, Executive Order 13175 does not apply to this action.

H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that concern environmental health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of ''covered regulatory action'' in section 2–202 of the Executive Order. This action is not subject to Executive Order 13045 because it does not concern an environmental health risk or safety risk.

I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This action is not subject to Executive Order 13211, because it is not a significant regulatory action under Executive Order 12866.

J. National Technology Transfer and Advancement Act (NTTAA)

This rulemaking does not involve technical standards.

K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes that this action is not subject to Executive Order 12898 (59 FR 7629, February 16, 1994) because it does not establish an environmental health or safety standard. This regulatory action revises the way in which information is reported to the Agency, increasing submission frequency and making adaptions so that just one reporting system can be used, but reducing overall burden; this regulatory action does not have any impact on human health or the environment.

L. Congressional Review Act (CRA)

This action is subject to the CRA, and the EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action is not a ''major rule'' as defined by 5 U.S.C. 804(2).

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedure, Air pollution control, Hazardous substances, Intergovernmental relations, Reporting and recordkeeping requirements.

Andrew Wheeler,

Administrator.

For the reasons set forth in the preamble, EPA amends 40 CFR part 63 as follows:

PART 63—NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart UUUUU—National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units

§ 63.10000 [Amended]

■ 2. In § 63.10000, paragraph (d)(5)(vi) is amended by adding the words ''where appropriate,'' immediately after the words ''CMS that is out of control consistent with section 63.8(c)(7)(i).''

■ 3. Section 63.10005 is amended by:

■ a. Revising the first sentence in paragraph (a)(2) introductory text;

■ b. Revising paragraph (b) introductory text; and

■ c. Revising paragraph (h)(3)(iii).

The revisions read as follows:

§ 63.10005 What are my initial compliance requirements and by what date must I conduct them?

(a) * * *

(2) To demonstrate initial compliance using either a CMS that measures HAP concentrations directly (*i.e.,* an Hg, HCl, or HF CEMS, or a sorbent trap monitoring system) or an SO_2 or PM CEMS, the initial performance test shall consist of 30- or, if applicable for Hg, 90-boiler operating days. * * *

* * * * *

(b) *Performance testing requirements.* If you choose to use performance testing to demonstrate initial compliance with the applicable emissions limits in Tables 1 and 2 to this subpart for your EGUs, you must conduct the tests according to 40 CFR 63.10007 and Table 5 to this subpart. Notwithstanding these requirements, when Table 5 specifies the use of isokinetic EPA test Method 5, 5D, 26A, or 29 for a stack test, if concurrent measurement of the stack gas flow rate or moisture content is needed to convert the pollutant concentrations to units of the standard, separate determination of these parameters using EPA test Method 2 or EPA test Method 4 is not necessary. Instead, the stack gas flow rate and moisture content can be determined from data that are collected during the EPA test Method 5, 5D, 6, 26A, or 29 test (*e.g.,* pitot tube (delta P) readings, moisture collected in the impingers, etc.). For the purposes of the initial compliance demonstration, you may use test data and results from a performance test conducted prior to the date on which compliance is required as specified in 40 CFR 63.9984, provided that the following conditions are fully met:

* * * * *

(h) * * *

(3) * * *

(iii) Calculate the average Hg concentration, in $\mu g/m^3$ (dry basis), for each of LEE test runs comprising the 30- (or 90-) boiler operating day performance test, as the arithmetic average of all Method 30B sorbent trap results from the LEE test period. Also calculate, as applicable, the average values of CO_2 or O_2 concentration, stack gas flow rate, stack gas moisture content, and gross output for the LEE test period. Then:

* * * * *

■ 4. Section 63.10009 is amended by:

■ a. Revising in paragraph (a)(2) the second, third, and last sentences;

■ b. In paragraph (b)(2):

■ i. In the introductory text, removing the words ''for pollutants other than Hg'';

■ ii. In the definition for ''Her_i'' adding the words ''or sorbent trap monitoring system'' after the words ''unit i's CEMS''; and

■ c. In paragraph (b)(3) revising ''Equation 3a'' and ''Equation 3b.''

The revisions read as follows:

§ 63.10009 May I use emissions averaging to comply with this subpart?

(a) * * *

(2) * * * Note that except for the alternate Hg emissions limit from EGUs in the ''unit designed for coal ≥ 8,300 Btu/lb'' subcategory, the averaging time for emissions averaging for pollutants is 30-group boiler operating days (rolling

daily) using data from CEMS and sorbent trap monitoring (for Hg), or a combination of data from CEMS and emissions testing (for other pollutants). The averaging time for emissions averaging for the alternate Hg limit (equal to or less than 1.0 lb/TBtu or 1.1E–2 lb/GWh) from EGUs in the ''unit designed for coal ≥ 8,300 Btu/lb'' subcategory is 90-group boiler operating days (rolling daily) using data from CEMS, sorbent trap monitoring, or a combination of data from CEMS and sorbent trap monitoring.

* * * You must calculate the weighted average emissions rate for the group in accordance with the procedures in this paragraph using the data from all units in the group including any that operate fewer than 30 (or 90) of the preceding 30- (or 90-) group boiler operating days.

* * * * *

(b) * * *

(3) * * *

$$WAER = \frac{\sum_{i=1}^{p}\left[\sum_{i=1}^{n}\left(Her_i \; x \; Rm_i\right)\right]_p}{\sum_{i=1}^{p}\left[\sum_{i=1}^{n}\left(Rm_i\right)\right]_p} \qquad \text{(Eq. 3a)}$$

Where:

Her_i = Hourly emission rate from unit i's Hg CEMS or Hg sorbent trap monitoring system for the preceding 90-group boiler operating days,

Rm_i = Hourly heat input or gross output from unit i for the preceding 90-group boiler operating days,

p = Number of EGUs in the emissions averaging group,

n = Number of hours that hourly rates are collected over the 90-group boiler operating days.

$$WAER = \frac{\sum_{i=1}^{p}\left[\sum_{i=1}^{n}\left(Her_i \; x \; Sm_i \; x \; Cfm_i\right)\right]_p}{\sum_{i=1}^{p}\left[\sum_{i=1}^{n}\left(Sm_i \; x \; Cfm_i\right)\right]_p} \qquad \text{(Eq. 3b)}$$

Where:

Her_i = Hourly emission rate from unit i's Hg CEMS or Hg sorbent trap monitoring system for the preceding 90-group boiler operating days,

Sm_i = Steam generation in units of pounds from unit i that uses Hg CEMS or Hg sorbent trap monitoring for the preceding 90-group boiler operating days,

Cfm_i = Conversion factor, calculated from the most recent compliance test results, in units of heat input per pound of steam generated or gross output per pound of steam generated, from unit i that uses Hg CEMS or sorbent trap monitoring from the preceding 90-group boiler operating days,

p = Number of EGUs in the emissions averaging group,

n = Number of hours that hourly rates are collected over the 90-group boiler operating days.

* * * * *

■ 5. Section 63.10010 is amended by revising paragraphs (h)(5), (6), (7), (i), and (j)(4) to read as follows:

§ 63.10010 What are my monitoring, installation, operation, and maintenance requirements?

* * * * *

(h) * * *

(5) You must collect data using the PM CPMS at all times the process unit is operating and at the intervals specified in paragraph (h)(1)(ii) of this section, except for required monitoring system quality assurance or quality control activities (including, as applicable, calibration checks and required zero and span adjustments), and any scheduled maintenance as defined in your site-specific monitoring plan.

(6) You must use all the data collected during all boiler operating hours in assessing the compliance with your operating limit except:

(i) Any data recorded during periods of monitoring system malfunctions or repairs associated with monitoring system malfunctions. You must report any monitoring system malfunctions as deviations in your compliance reports under 40 CFR 63.10031(c) or (g) (as applicable);

(ii) Any data recorded during periods when the monitoring system is out-of-control (as specified in your site-specific monitoring plan), repairs associated with periods when the monitoring system is out of control, or required monitoring system quality assurance or quality control activities conducted during out-of-control periods. You must report any such periods as deviations in your compliance reports under 40 CFR 63.10031(c) or (g) (as applicable);

(iii) Any data recorded during required monitoring system quality assurance or quality control activities that temporarily interrupt the measurement of output data from the PM CPMS; and

(iv) Any data recorded during periods of startup or shutdown.

(7) You must record and report the results of PM CPMS system performance audits, in accordance with 40 CFR 63.10031(k). You must also record and make available upon request the dates and duration of periods from when the PM CPMS is out of control until completion of the corrective actions necessary to return the PM CPMS to operation consistent with your site-specific monitoring plan.

(i) If you choose to comply with the PM filterable emissions limit in lieu of metal HAP limits, you may choose to install, certify, operate, and maintain a PM CEMS and record and report the output of the PM CEMS as specified in paragraphs (i)(1) through (8) of this section. Compliance with the applicable PM emissions limit in Table 1 or 2 to this subpart is determined on a 30-boiler operating day rolling average basis.

(1) You must install and certify your PM CEMS according to section 4 of appendix C to this subpart.

(2) You must operate, maintain, and quality-assure the data from your PM

CEMS according to section 5 of appendix C to this subpart.

(3) You must reduce the data from your PM CEMS to hourly averages in accordance with section 6.1 of appendix C to this subpart.

(4) You must collect data using the PM CEMS at all times the process unit is operating and at the intervals specified in paragraph (a) of this section, except for required monitoring system quality assurance or quality control activities and any scheduled maintenance as defined in your site-specific monitoring plan.

(5) You must use all the data collected during all boiler operating hours in assessing the compliance with your operating limit except:

(i) Any data recorded during periods of monitoring system malfunctions and repairs associated with monitoring system malfunctions. You must report any monitoring system malfunctions as deviations in your compliance reports under 40 CFR 63.10031(c) or (g) (as applicable);

(ii) Any data recorded during periods when the monitoring system is out-of-control (as specified in appendix C to this subpart), repairs associated with periods when the monitoring system is out of control, or required monitoring system quality assurance or quality control activities conducted during out-of-control periods. You must report any such periods as deviations in your compliance reports under 40 CFR 63.10031(c) or (g) (as applicable);

(iii) Any data recorded during required monitoring system quality assurance, quality control, or maintenance activities that temporarily interrupt the measurement of emissions (*e.g.,* calibrations, certain audits, routine probe maintenance); and

(iv) Any data recorded during periods of startup or shutdown.

(6) You must keep records and report data from your PM CEMS in accordance with section 7 of appendix C to this subpart.

(7) You must record and make available upon request the dates and duration of periods when the PM CEMS is out-of-control to completion of the corrective actions necessary to return the PM CEMS to operation consistent with your site-specific monitoring plan.

(8) You must calculate each 30-boiler operating day rolling average PM emission rate in units of the applicable emissions limit in Table 1 or 2 to this subpart, in accordance with section 6.2.4 of appendix C to this subpart.

(j) * * *

(4) You must collect data using the HAP metals CEMS at all times the process unit is operating and at the intervals specified in paragraph (a) of this section, except for required monitoring system quality assurance or quality control activities, and any scheduled maintenance as defined in your site-specific monitoring plan.

(i) You must use all the data collected during all boiler operating hours in assessing the compliance with your emission limit except:

(A) Any data collected during periods of monitoring system malfunctions and repairs associated with monitoring system malfunctions. You must report any monitoring system malfunctions as deviations in your compliance reports under 40 CFR 63.10031(c) or (g) (as applicable);

(B) Any data collected during periods when the monitoring system is out of control as specified in your site-specific monitoring plan, repairs associated with periods when the monitoring system is out of control, or required monitoring system quality assurance or quality control activities conducted during out-of-control periods. You must report any out of control periods as deviations in your compliance reports under 40 CFR 63.10031(c) or (g) (as applicable);

(C) Any data recorded during required monitoring system quality assurance or quality control activities that temporarily interrupt the measurement of emissions (*e.g.,* calibrations, certain audits, routine probe maintenance); and

(D) Any data recorded during periods of startup or shutdown.

(ii) You must record and report the results of HAP metals CEMS system performance audits, in accordance with 40 CFR 63.10031(k). You must also record and make available upon request the dates and duration of periods when the HAP metals CEMS is out of control to completion of the corrective actions necessary to return the HAP metals CEMS to operation consistent with your site-specific performance evaluation and quality control program plan.

* * * * *

■ 6. Section 63.10011 is amended by revising paragraphs (e) and (g)(3) to read as follows:

§ 63.10011 How do I demonstrate initial compliance with the emissions limits and work practice standards?

* * * * *

(e) You must submit a Notification of Compliance Status in accordance with 40 CFR 63.10031(f)(4) or (h), as applicable, containing the results of the initial compliance demonstration, as specified in 40 CFR 63.10030(e).

* * * * *

(g) * * *

(3) You must report the emissions data recorded during startup and shutdown. If you are relying on paragraph (2) of the definition of startup in 40 CFR 63.10042, then for startup and shutdown incidents that occur on or prior to December 31, 2023, you must also report the applicable supplementary information in 40 CFR 63.10031(c)(5) in the semiannual compliance report. For startup and shutdown incidents that occur on or after January 1, 2024, you must provide the applicable information in 40 CFR 63.10031(c)(5)(ii) and 40 CFR 63.10020(e) quarterly, in PDF files, in accordance with 40 CFR 63.10031(i).

* * * * *

■ 7. Section 63.10020 is amended by revising paragraphs (a), (b), and (d) to read as follows:

§ 63.10020 How do I monitor and collect data to demonstrate continuous compliance?

(a) You must monitor and collect data according to this section and the site-specific monitoring plan required by § 63.10000(d).

(b) You must operate the monitoring system and collect data at all required intervals at all times that the affected EGU is operating, except for required monitoring system quality assurance or quality control activities, including, as applicable, calibration checks and required zero and span adjustments, and any scheduled maintenance as defined in your site-specific monitoring plan. You are required to affect monitoring system repairs in response to monitoring system malfunctions and to return the monitoring system to operation as expeditiously as practicable.

* * * * *

(d) Periods of monitoring system malfunctions or monitoring system out-of-control periods, repairs associated with monitoring system malfunctions or monitoring system out-of-control periods, and required monitoring system quality assurance or quality control activities excluding zero and span checks must be reported as time the monitor was inoperative (downtime) under 63.10(c). Failure to collect required quality-assured data during monitoring system malfunctions, monitoring system out-of-control periods, or repairs associated with monitoring system malfunctions or monitoring system out-of-control periods is a deviation from the monitoring requirements.

* * * * *

■ 8. Section 63.10021 is amended by:

■ a. Revising paragraphs (e)(9) and (f);

■ b. Removing and reserving paragraph (h)(3); and

■ c. Revising paragraph (i).

The revisions read as follows:

§ 63.10021 How do I demonstrate continuous compliance with the emission limitations, operating limits, and work practice standards?

* * * * *

(e) * * *

(9) Prior to January 1, 2024, report the tune-up date electronically, in a PDF file, in your semiannual compliance report, as specified in 40 CFR 63.10031(f)(4) and (6) and, if requested by the Administrator, in hard copy, as specified in 40 CFR 63.10031(f)(5). On and after January 1, 2024, report the tune-up date electronically in your quarterly compliance report, in accordance with 40 CFR 63.10031(g) and section 10.2 of appendix E to this subpart. The tune-up report date is the date when tune-up requirements in paragraphs (e)(6) and (7) of this section are completed.

* * * * *

(f) You must submit the applicable reports and notifications required under 40 CFR 63.10031(a) through (k) to the Administrator electronically, using EPA's Emissions Collection and Monitoring Plan System (ECMPS) Client Tool. If the final date of any time period (or any deadline) for any of these submissions falls on a weekend or a Federal holiday, the time period shall be extended to the next business day. Moreover, if the EPA Host System supporting the ECMPS Client Tool is offline and unavailable for submission of reports for any part of a day when a report would otherwise be due, the deadline for reporting is automatically extended until the first business day on which the system becomes available following the outage. Use of the ECMPS Client Tool to submit a report or notification required under this subpart satisfies any requirement under subpart A of this part to submit that same report or notification (or the information contained in it) to the appropriate EPA Regional office or state agency whose delegation request has been approved.

* * * * *

(i) If you are relying on paragraph 2 of the definition of startup in 40 CFR 63.10042, you must provide reports concerning activities and periods of startup and shutdown that occur on or prior to January 1, 2024, in accordance with 40 CFR 63.10031(c)(5), in your semiannual compliance report. For startup and shutdown incidents that occur on and after January 1, 2024, you must provide the applicable information referenced in 40 CFR 63.10031(c)(5)(ii) and 40 CFR 63.10020(e) quarterly, in PDF files, in accordance with 40 CFR 63.10031(i).

■ 9. Section 63.10030 is amended by:

■ a. In paragraph (e) introductory text revising the last sentence;

■ b. Revising paragraph (e)(7) introductory text;

■ c. Removing and reserving paragraph (e)(7)(i);

■ d. Revising paragraph (e)(7)(iii) introductory text;

■ e. Revising paragraph (e)(7)(iii)(A)(*3*);

■ f. Adding in paragraph (e)(7)(iii)(B) the word ''must'' after the word ''You''; and

■ g. Adding in paragraph (e)(7)(iii)(C) the word ''must'' after the word ''you''.

The revisions and additions read as follows:

§ 63.10030 What notifications must I submit and when?

* * * * *

(e) * * * The Notification of Compliance Status report must contain all of the information specified in paragraphs (e)(1) through (8) of this section, that applies to your initial compliance strategy.

* * * * *

(7) Except for requests to switch from one emission limit to another, as provided in paragraph (e)(7)(iii) of this section, your initial notification of compliance status shall also include the following information:

* * * * *

(iii) For each of your existing EGUs, identification of each emissions limit specified in Table 2 to this subpart with which you plan to comply initially. (*Note:* If, at some future date, you wish to switch from the limit specified in your initial notification of compliance status, you must follow the procedures and meet the conditions of paragraphs (e)(7)(iii)(A) through (C) of this section).

(A) * * *

(*3*) Your request includes performance stack test results or valid CMS data, obtained within 45 days prior to the date of your submission, demonstrating that each EGU or EGU emissions averaging group is in compliance with both the mass per heat input limit and the mass per gross output limit;

* * * * *

■ 10. Section 63.10031 is amended by:

■ a. Revising paragraphs (a), (b) introductory text, (b)(1), (2), (4), (5);

■ b. Adding paragraph (b)(6);

■ c. Revising paragraph (c) introductory text;

■ d. Removing and reserving paragraphs (c)(5)(iii), (c)(5)(iv), and (c)(5)(v);

■ e. Adding paragraph (c)(10);

■ f. Revising paragraphs (d), (e), (f) introductory text, (f)(1), and (2);

■ g. Removing and reserving paragraph (f)(3);

■ h. Revising paragraphs (f)(4), (f)(6) introductory text, (f)(6)(vii), (f)(6)(xi), and (g); and

■ i. Adding paragraphs (h), (i), (j) and (k), to read as follows:

§ 63.10031 What reports must I submit and when?

(a) You must submit each report in this section that applies to you.

(1) If you are required to (or elect to) monitor Hg emissions continuously, you must meet the electronic reporting requirements of appendix A to this subpart.

(2) If you elect to monitor HCl and/or HF emissions continuously, you must meet the electronic reporting requirements of appendix B to this subpart. Notwithstanding this requirement, if you opt to certify your HCl monitor according to Performance Specification 18 in appendix B to part 60 of this chapter and to use Procedure 6 in appendix F to part 60 of this chapter for on-going QA of the monitor, then, on and prior to December 31, 2023, report only hourly HCl emissions data and the results of daily calibration drift tests and relative accuracy test audits (RATAs) performed on or prior to that date; keep records of all of the other required certification and QA tests and report them, starting in 2024.

(3) If you elect to monitor filterable PM emissions continuously, you must meet the electronic reporting requirements of appendix C to this subpart. Electronic reporting of hourly PM emissions data shall begin with the later of the first operating hour on or after January 1, 2024; or the first operating hour after completion of the initial PM CEMS correlation test.

(4) If you elect to demonstrate continuous compliance using a PM CPMS, you must meet the electronic reporting requirements of appendix D to this subpart. Electronic reporting of the hourly PM CPMS output shall begin with the later of the first operating hour on or after January 1, 2024; or the first operating hour after completion of the initial performance stack test that establishes the operating limit for the PM CPMS.

(5) If you elect to monitor SO_2 emission rate continuously as a surrogate for HCl, you must use the ECMPS Client Tool to submit the following information to EPA (except where it is already required to be reported or has been previously provided under the Acid Rain Program or another emissions reduction program that requires the use of part 75 of this chapter):

(i) Monitoring plan information for the SO_2 CEMS and for any additional monitoring systems that are required to convert SO_2 concentrations to units of the emission standard, in accordance with sections 75.62 and 75.64(a)(4) of this chapter;

(ii) Certification, recertification, quality-assurance, and diagnostic test results for the SO_2 CEMS and for any additional monitoring systems that are required to convert SO_2 concentrations to units of the emission standard, in accordance with section 75.64(a)(5); and

(iii) Quarterly electronic emissions reports. You must submit an electronic quarterly report within 30 days after the end of each calendar quarter, starting with a report for the calendar quarter in which the initial 30 boiler operating day performance test begins. Each report must include the following information:

(A) The applicable operating data specified in section 75.57(b) of this chapter;

(B) An hourly data stream for the unadjusted SO_2 concentration (in ppm, rounded to one decimal place), and separate unadjusted hourly data streams for the other parameters needed to convert the SO_2 concentrations to units of the standard. (*Note:* If a default moisture value is used in the emission rate calculations, an hourly data stream is not required for moisture; rather, the default value must be reported in the electronic monitoring plan.);

(C) An hourly SO_2 emission rate data stream, in units of the standard (*i.e.,* lb/MMBtu or lb/MWh, as applicable), calculated according to 40 CFR 63.10007(e) and (f)(1), rounded to the same precision as the emission standard (*i.e.,* with one leading non-zero digit and one decimal place), expressed in scientific notation. Use the following rounding convention: If the digit immediately following the first decimal place is 5 or greater, round the first decimal place upward (increase it by one); if the digit immediately following the first decimal place is 4 or less, leave the first decimal place unchanged;

(D) The results of all required daily quality-assurance tests of the SO_2 monitor and the additional monitors used to convert SO_2 concentration to units of the standard, as specified in appendix B to part 75 of this chapter; and

(E) A compliance certification, which includes a statement, based on reasonable inquiry of those persons with primary responsibility for ensuring that all SO_2 emissions from the affected EGUs under this subpart have been correctly and fully monitored, by a responsible official with that official's name, title, and signature, certifying that, to the best of his or her knowledge, the report is true, accurate, and complete. You must submit such a compliance certification statement in support of each quarterly report.

(b) You must submit semiannual compliance reports according to the requirements in paragraphs (b)(1) through (5) of this section.

(1) The first compliance report must cover the period beginning on the compliance date that is specified for your affected source in 40 CFR 63.9984 (or, if applicable, the extended compliance date approved under 40 CFR 63.6(i)(4)) and ending on June 30 or December 31, whichever date is the first date that occurs at least 180 days after the compliance date that is specified for your source in 40 CFR 63.9984 (or, if applicable, the extended compliance date approved under 40 CFR 63.6(i)(4)).

(2) The first compliance report must be submitted electronically no later than July 31 or January 31, whichever date is the first date following the end of the first calendar half after the compliance date that is specified for your source in 40 CFR 63.9984 (or, if applicable, the extended compliance date approved under 40 CFR 63.6(i)(4)).

* * * * *

(4) Each subsequent compliance report must be submitted electronically no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

(5) For each affected source that is subject to permitting regulations pursuant to part 70 or part 71 of this chapter, and if the permitting authority has established dates for submitting semiannual reports pursuant to 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), through the reporting period that ends December 31, 2023, you may submit the first and subsequent compliance reports according to the dates the permitting authority has established instead of according to the dates in paragraphs (b)(1) through (4) of this section.

(6) The final semiannual compliance report shall cover the reporting period from July 1, 2023, through December 31, 2023. Quarterly compliance reports shall be submitted thereafter, in accordance with paragraph (g) of this section, starting with a report covering the first calendar quarter of 2024.

(c) The semiannual compliance report must contain the information required in paragraphs (c)(1) through (10) of this section.

* * * * *

(10) If you had any process or control equipment malfunction(s) during the reporting period, you must include the number, duration, and a brief description for each type of malfunction which occurred during the semiannual reporting period which caused or may have caused any applicable emission limitation to be exceeded.

(d) Excess emissions and deviation reporting. For EGUs whose owners or operators rely on a CMS to comply with an emissions or operating limit, the semiannual compliance reports described in paragraph (c) of this section must include the excess emissions and monitor downtime summary report described in 40 CFR 63.10(e)(3)(vi). However, starting with the first calendar quarter of 2024, reporting of the information under 40 CFR 63.10(e)(3)(vi) (and under paragraph (e)(3)(v), if the applicable excess emissions and/or monitor downtime threshold is exceeded) is discontinued for all CMS, and you must, instead, include in the quarterly compliance reports described in paragraph (g) of this section the applicable data elements in section 13 of appendix E to this subpart for any ''deviation'' (as defined in 40 CFR 63.10042 and elsewhere in this subpart) that occurred during the calendar quarter. If there were no deviations, you must include a statement to that effect in the quarterly compliance report.

(e) Each affected source that has obtained a title V operating permit pursuant to part 70 or part 71 of this chapter must report all deviations as defined in this subpart in the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A). If an affected source submits a semiannual compliance report pursuant to paragraphs (c) and (d) of this section, or two quarterly compliance reports covering the appropriate calendar half pursuant to paragraph (g) of this section, along with, or as part of, the semiannual monitoring report required by 40 CFR 70.6(a)(3)(iii)(A) or 40 CFR 71.6(a)(3)(iii)(A), and the compliance report(s) includes all required information concerning deviations from any emission limit, operating limit, or work practice requirement in this subpart, submission of the compliance report(s) satisfies any obligation to report the same deviations in the semiannual monitoring report. Submission of the compliance report(s) does not otherwise affect any obligation the affected source may have to report deviations from permit requirements to the permit authority.

(f) For each performance stack test completed prior to January 1, 2024, (including 30- (or 90-) boiler operating

day Hg LEE demonstration tests and PM tests to establish operating limits for PM CPMS), you must submit a PDF test report in accordance with paragraph (f)(6) of this section, no later than 60 days after the date on which the testing is completed. For each test completed on or after January 1, 2024, in accordance with 40 CFR 63.10031(g), submit the applicable reference method information in sections 17 through 31 of appendix E to this subpart along with the quarterly compliance report for the calendar quarter in which the test was completed.

(1) For each RATA of an Hg, HCl, HF, or SO_2 monitoring system completed prior to January 1, 2024, and for each PM CEMS correlation test, each relative response audit (RRA) and each response correlation audit (RCA) of a PM CEMS completed prior to that date, you must submit a PDF test report in accordance with paragraph (f)(6) of this section, no later than 60 days after the date on which the test is completed. For each SO_2 or Hg RATA completed on or after January 1, 2024, you must submit the applicable reference method information in sections 17 through 31 of appendix E to this subpart prior to or concurrent with the relevant quarterly emissions report. For HCl or HF RATAs, and for correlation tests, RRAs, and RCAs of PM CEMS that are completed on or after January 1, 2024, submit the appendix E reference method information together with the summarized electronic test results, in accordance with section 11.4 of appendix B to this subpart or section 7.2.4 of appendix C to this part, as applicable.

(2) If, for a particular EGU or a group of EGUs serving a common stack, you have elected to demonstrate compliance using a PM CEMS, an approved HAP metals CEMS, or a PM CPMS, you must submit quarterly PDF reports in accordance with paragraph (f)(6) of this section, which include all of the 30-boiler operating day rolling average emission rates derived from the CEMS data or the 30-boiler operating day rolling average responses derived from the PM CPMS data (as applicable). The quarterly reports are due within 60 days after the reporting periods ending on March 31st, June 30th, September 30th, and December 31st. Submission of these quarterly reports in PDF files shall end with the report that covers the fourth calendar quarter of 2023. Beginning with the first calendar quarter of 2024, the compliance averages shall no longer be reported separately, but shall be incorporated into the quarterly compliance reports described in paragraph (g) of this section. In addition to the compliance averages for PM CEMS, PM CPMS, and/or HAP metals CEMS, the quarterly compliance reports described in paragraph (g) of this section must also include the 30- (or, if applicable 90-) boiler operating day rolling average emission rates for Hg, HCl, HF, and/or SO_2, if you have elected to (or are required to) continuously monitor these pollutants. Further, if your EGU or common stack is in an averaging plan, your quarterly compliance reports must identify all of the EGUs or common stacks in the plan and must include all of the 30- (or 90-) group boiler operating day rolling weighted average emission rates (WAERs) for the averaging group.

(3) [Reserved]

(4) You must submit semiannual compliance reports as required under paragraphs (b) through (d) of this section, ending with a report covering the semiannual period from July 1 through December 31, 2023, and Notifications of Compliance Status as required under section 63.10030(e), as PDF files. Quarterly compliance reports shall be submitted in XML format thereafter, in accordance with paragraph (g) of this section, starting with a report covering the first calendar quarter of 2024.

* * * * *

(6) All reports and notifications described in paragraphs (f) introductory text, (f)(1), (2), and (4) of this section shall be submitted to the EPA in the specified format and at the specified frequency, using the ECMPS Client Tool. Each PDF version of a stack test report, CEMS RATA report, PM CEMS correlation test report, RRA report, and RCA report must include sufficient information to assess compliance and to demonstrate that the reference method testing was done properly. Note that EPA will continue to accept, as necessary, PDF reports that are being phased out at the end of 2023, if the submission deadlines for those reports extend beyond December 31, 2023. The following data elements must be entered into the ECMPS Client Tool at the time of submission of each PDF file:

* * * * *

(vii) An indication of the type of PDF report or notification being submitted;

* * * * *

(xi) The date the performance test was completed (if applicable) and the test number (if applicable); and

* * * * *

(g) Starting with a report for the first calendar quarter of 2024, you must use the ECMPS Client Tool to submit quarterly electronic compliance reports. Each quarterly compliance report shall include the applicable data elements in sections 2 through 13 of appendix E to this subpart. For each stack test summarized in the compliance report, you must also submit the applicable reference method information in sections 17 through 31 of appendix E to this subpart. The compliance reports and associated appendix E information must be submitted no later than 60 days after the end of each calendar quarter.

(h) On and after January 1, 2024, initial Notifications of Compliance Status (if any) shall be submitted in accordance with 40 CFR 63.9(h)(2)(ii), as PDF files, using the ECMPS Client Tool. The applicable data elements in paragraphs (f)(6)(i) through (xii) of this section must be entered into ECMPS with each Notification.

(i) If you have elected to use paragraph (2) of the definition of ''startup'' in 40 CFR 63.10042, then, for startup and shutdown incidents that occur on or prior to December 31, 2023, you must include the information in 40 CFR 63.10031(c)(5) in the semiannual compliance report, in a PDF file. If you have elected to use paragraph (2) of the definition of ''startup'' in 40 CFR 63.10042, then, for startup and shutdown event(s) that occur on or after January 1, 2024, you must use the ECMPS Client Tool to submit the information in 40 CFR 63.10031(c)(5) and 40 CFR 63.10020(e) along with each quarterly compliance report, in a PDF file, starting with a report for the first calendar quarter of 2024. The applicable data elements in paragraphs (f)(6)(i) through (xii) of this section must be entered into ECMPS with each startup and shutdown report.

(j) If you elect to use a certified PM CEMS to monitor PM emissions continuously to demonstrate compliance with this subpart and have begun recording valid data from the PM CEMS prior to November 9, 2020, you must use the ECMPS Client Tool to submit a detailed report of your PS 11 correlation test (see appendix B to part 60 of this chapter) in a PDF file no later than 60 days after that date. For a correlation test completed on or after November 9, 2020, but prior to January 1, 2024, you must submit the PDF report no later than 60 days after the date on which the test is completed. For a correlation test completed on or after January 1, 2024, you must submit the PDF report according to section 7.2.4 of appendix C to this subpart. The applicable data elements in paragraph (f)(6)(i) through (xii) of this section must be entered into ECMPS with the PDF report.

(k) If you elect to demonstrate compliance using a PM CPMS or an

approved HAP metals CEMS, you must submit quarterly reports of your QA/QC activities (*e.g.,* calibration checks, performance audits), in a PDF file, beginning with a report for the first quarter of 2024, if the PM CPMS or HAP metals CEMS is used for the compliance demonstration in that quarter. Otherwise, submit a report for the first calendar quarter in which the PM CPMS or HAP metals CEMS is used to demonstrate compliance. These reports are due no later than 60 days after the end of each calendar quarter. The applicable data elements in paragraph (f)(6)(i) through (xii) of this section must be entered into ECMPS with the PDF report.

■ 11. Section 63.10032 is amended by revising paragraphs (a) introductory text and (a)(1) to read as follows:

§ 63.10032 What records must I keep?

(a) You must keep records according to paragraphs (a)(1) and (2) of this section. If you are required to (or elect to) continuously monitor Hg and/or HCl and/or HF and/or PM emissions, or if you elect to use a PM CPMS, you must keep the records required under appendix A and/or appendix B and/or appendix C and/or appendix D to this subpart. If you elect to conduct periodic (*e.g.,* quarterly or annual) performance stack tests, then, for each test completed on or after January 1, 2024, you must keep records of the applicable data elements under 40 CFR 63.7(g). You must also keep records of all data elements and other information in appendix E to this subpart that apply to your compliance strategy.

(1) In accordance with 40 CFR 63.10(b)(2)(xiv), a copy of each notification or report that you submit to comply with this subpart. You must also keep records of all supporting documentation for the initial Notifications of Compliance Status, semiannual compliance reports, or quarterly compliance reports that you submit.

* * * * *

■ 12. Section 63.10042 is amended by:

■ a. In the definition ''*Diluent cap*'' adding the word ''PM,'' after the word ''HF,'';

■ b. In the definition ''*Monitoring system malfunction or out of control period*'' removing the words ''*or out of control period*''; and

■ c. Adding the definition ''*Out of control period*'' in alphabetical order.

The addition reads as follows:

§ 63.10042 What definitions apply to this subpart?

* * * * *

Out-of-control period, as it pertains to continuous monitoring systems, means any period:

(1) Beginning with the hour corresponding to the completion of a daily calibration or quality assurance audit that indicates that the instrument fails to meet the applicable acceptance criteria; and

(2) Ending with the hour corresponding to the completion of an additional calibration or quality assurance audit following corrective action showing that the instrument meets the applicable acceptance criteria.

* * * * *

■ 13. Table 3 to subpart UUUUU is amended by revising the entries ''3. A coal-fired, liquid oil-fired (excluding limited-use liquid oil-fired subcategory units), or solid oil-derived fuel-fired EGU during startup'' and ''4. A coal-fired, liquid oil-fired (excluding limited-use liquid oil-fired subcategory units), or solid oil-derived fuel-fired EGU during shutdown'' to read as follows:

TABLE 3 TO SUBPART UUUUU OF PART 63—WORK PRACTICE STANDARDS

* * * * * * *

If your EGU is . . .	You must meet the following . . .
* *	* * * * * *
3. A coal-fired, liquid oil-fired (excluding limited-use liquid oil-fired subcategory units), or solid oil-derived fuel-fired EGU during startup.	a. You have the option of complying using either of the following work practice standards: (1) If you choose to comply using paragraph (1) of the definition of ''startup'' in § 63.10042, you must operate all CMS during startup. Startup means either the first-ever firing of fuel in a boiler for the purpose of producing electricity, or the firing of fuel in a boiler after a shutdown event for any purpose. Startup ends when any of the steam from the boiler is used to generate electricity for sale over the grid or for any other purpose (including on site use). For startup of a unit, you must use clean fuels as defined in § 63.10042 for ignition. Once you convert to firing coal, residual oil, or solid oil-derived fuel, you must engage all of the applicable control technologies except dry scrubber and SCR. You must start your dry scrubber and SCR systems, if present, appropriately to comply with relevant standards applicable during normal operation. You must comply with all applicable emissions limits at all times except for periods that meet the applicable definitions of startup and shutdown in this subpart. You must keep records during startup periods. You must provide reports concerning activities and startup periods, as specified in § 63.10011(g) and § 63.10021(h) and (i). If you elect to use paragraph (2) of the definition of startup in 40 CFR 63.10042, you must report the applicable information in 40 CFR 63.10031(c)(5) concerning startup periods as follows: For startup periods that occur on or prior to December 31, 2023, in PDF files in the semiannual compliance report; for startup periods that occur on or after January 1, 2024, quarterly, in PDF files, according to 40 CFR 63.10031(i). (2) If you choose to comply using paragraph (2) of the definition of ''startup'' in § 63.10042, you must operate all CMS during startup. You must also collect appropriate data, and you must calculate the pollutant emission rate for each hour of startup. For startup of an EGU, you must use one or a combination of the clean fuels defined in § 63.10042 to the maximum extent possible, taking into account considerations such as boiler or control device integrity, throughout the startup period. You must have sufficient clean fuel capacity to engage and operate your PM control device within one hour of adding coal, residual oil, or solid oil-derived fuel to the unit. You must meet the startup period work practice requirements as identified in § 63.10020(e). Once you start firing coal, residual oil, or solid oil-derived fuel, you must vent emissions to the main stack(s). You must comply with the applicable emission limits beginning with the hour after startup ends. You must engage and operate your PM control(s) within 1 hour of first firing of coal, residual oil, or solid oil-derived fuel.

TABLE 3 TO SUBPART UUUUU OF PART 63—WORK PRACTICE STANDARDS—Continued

* * * * * * *

If your EGU is . . .	You must meet the following . . .
	You must start all other applicable control devices as expeditiously as possible, considering safety and manufacturer/supplier recommendations, but, in any case, when necessary to comply with other standards made applicable to the EGU by a permit limit or a rule other than this subpart that require operation of the control devices. b. Relative to the syngas not fired in the combustion turbine of an IGCC EGU during startup, you must either: (1) Flare the syngas, or (2) route the syngas to duct burners, which may need to be installed, and route the flue gas from the duct burners to the heat recovery steam generator. c. If you choose to use just one set of sorbent traps to demonstrate compliance with the applicable Hg emission limit, you must comply with the limit at all times; otherwise, you must comply with the applicable emission limit at all times except for startup and shutdown periods. d. You must collect monitoring data during startup periods, as specified in § 63.10020(a) and (e). You must keep records during startup periods, as provided in §§ 63.10021(h) and 63.10032. You must provide reports concerning activities and startup periods, as specified in §§ 63.10011(g), 63.10021(i), and 63.10031. If you elect to use paragraph (2) of the definition of startup in 40 CFR 63.10042, you must report the applicable information in 40 CFR 63.10031(c)(5) concerning startup periods as follows: For startup periods that occur on or prior to December 31, 2023, in PDF files in the semiannual compliance report; for startup periods that occur on or after January 1, 2024, quarterly, in PDF files, according to 40 CFR 63.10031(i).
4. A coal-fired, liquid oil-fired (excluding limited-use liquid oil-fired subcategory units), or solid oil-derived fuel-fired EGU during shutdown.	You must operate all CMS during shutdown. You must also collect appropriate data, and you must calculate the pollutant emission rate for each hour of shutdown for those pollutants for which a CMS is used. While firing coal, residual oil, or solid oil-derived fuel during shutdown, you must vent emissions to the main stack(s) and operate all applicable control devices and continue to operate those control devices after the cessation of coal, residual oil, or solid oil-derived fuel being fed into the EGU and for as long as possible thereafter considering operational and safety concerns. In any case, you must operate your controls when necessary to comply with other standards made applicable to the EGU by a permit limit or a rule other than this subpart and that require operation of the control devices. If, in addition to the fuel used prior to initiation of shutdown, another fuel must be used to support the shutdown process, that additional fuel must be one or a combination of the clean fuels defined in § 63.10042 and must be used to the maximum extent possible, taking into account considerations such as not compromising boiler or control device integrity. Relative to the syngas not fired in the combustion turbine of an IGCC EGU during shutdown, you must either: (1) Flare the syngas, or (2) route the syngas to duct burners, which may need to be installed, and route the flue gas from the duct burners to the heat recovery steam generator. You must comply with all applicable emission limits at all times except during startup periods and shutdown periods at which time you must meet this work practice. You must collect monitoring data during shutdown periods, as specified in § 63.10020(a). You must keep records during shutdown periods, as provided in §§ 63.10032 and 63.10021(h). Any fraction of an hour in which shutdown occurs constitutes a full hour of shutdown. You must provide reports concerning activities and shutdown periods, as specified in §§ 63.10011(g), 63.10021(i), and 63.10031. If you elect to use paragraph (2) of the definition of startup in 40 CFR 63.10042, you must report the applicable information in 40 CFR 63.10031(c)(5) concerning shutdown periods as follows: For shutdown periods that occur on or prior to December 31, 2023, in PDF files in the semiannual compliance report; for shutdown periods that occur on or after January 1, 2024, quarterly, in PDF files, according to 40 CFR 63.10031(i).

* * * * *

■ 14. Table 8 to subpart UUUUU is revised to read as follows:

TABLE 8 TO SUBPART UUUUU OF PART 63—REPORTING REQUIREMENTS

[In accordance with 40 CFR 63.10031, you must meet the following reporting requirements, as they apply to your compliance strategy]

You must submit the following reports . . .
1. The electronic reports required under 40 CFR 63.10031 (a)(1), if you continuously monitor Hg emissions.
2. The electronic reports required under 40 CFR 63.10031 (a)(2), if you continuously monitor HCl and/or HF emissions. Where applicable, these reports are due no later than 30 days after the end of each calendar quarter.
3. The electronic reports required under 40 CFR 63.10031(a)(3), if you continuously monitor PM emissions. Reporting of hourly PM emissions data using ECMPS shall begin with the first operating hour after: January 1, 2024, or the hour of completion of the initial PM CEMS correlation test, whichever is later. Where applicable, these reports are due no later than 30 days after the end of each calendar quarter.
4. The electronic reports required under 40 CFR 63.10031(a)(4), if you elect to use a PM CPMS. Reporting of hourly PM CPMS response data using ECMPS shall begin with the first operating hour after January 1, 2024, or the first operating hour after completion of the initial performance stack test that establishes the operating limit for the PM CPMS, whichever is later. Where applicable, these reports are due no later than 30 days after the end of each calendar quarter.
5. The electronic reports required under 40 CFR 63.10031(a)(5), if you continuously monitor SO_2 emissions. Where applicable, these reports are due no later than 30 days after the end of each calendar quarter.

TABLE 8 TO SUBPART UUUUU OF PART 63—REPORTING REQUIREMENTS—Continued

[In accordance with 40 CFR 63.10031, you must meet the following reporting requirements, as they apply to your compliance strategy]

You must submit the following reports . . .
6. PDF reports for all performance stack tests completed prior to January 1, 2024 (including 30- or 90-boiler operating day Hg LEE test reports and PM test reports to set operating limits for PM CPMS), according to the introductory text of 40 CFR 63.10031(f) and 40 CFR 63.10031(f)(6). For each test, submit the PDF report no later than 60 days after the date on which testing is completed. For a PM test that is used to set an operating limit for a PM CPMS, the report must also include the information in 40 CFR 63.10023(b)(2)(vi). For each performance stack test completed on or after January 1, 2024, submit the test results in the relevant quarterly compliance report under 40 CFR 63.10031(g), together with the applicable reference method information in sections 17 through 31 of appendix E to this subpart.
7. PDF reports for all RATAs of Hg, HCl, HF, and/or SO_2 monitoring systems completed prior to January 1, 2024, and for correlation tests, RRAs and/or RCAs of PM CEMS completed prior to January 1, 2024, according to 40 CFR 63.10031(f)(1) and (6). For each test, submit the PDF report no later than 60 days after the date on which testing is completed. For each SO_2 or Hg system RATA completed on or after January 1, 2024, submit the electronic test summary required by appendix A to this subpart or part 75 of this chapter (as applicable) together with the applicable reference method information in sections 17 through 30 of appendix E to this subpart, either prior to or concurrent with the relevant quarterly emissions report. For each HCl or HF system RATA, and for each correlation test, RRA, and RCA of a PM CEMS completed on or after January 1, 2024, submit the electronic test summary in accordance with section 11.4 of appendix B to this subpart or section 7.2.4 of appendix C to this part, as applicable, together with the applicable reference method information in sections 17 through 30 of appendix E to this subpart.
8. Quarterly reports, in PDF files, that include all 30-boiler operating day rolling averages in the reporting period derived from your PM CEMS, approved HAP metals CEMS, and/or PM CPMS, according to 40 CFR 63.10031(f)(2) and (6). These reports are due no later than 60 days after the end of each calendar quarter. The final quarterly rolling averages report in PDF files shall cover the fourth calendar quarter of 2023. Starting with the first quarter of 2024, you must report all 30-boiler operating day rolling averages for PM CEMS, approved HAP metals CEMS, PM CPMS, Hg CEMS, Hg sorbent trap systems, HCl CEMS, HF CEMS, and/or SO_2 CEMS (or 90-boiler operating day rolling averages for Hg systems), in XML format, in the quarterly compliance reports required under 40 CFR 63.10031(g). If your EGU or common stack is in an averaging plan, each quarterly compliance report must identify the EGUs in the plan and include all of the 30- or 90- group boiler operating day WAERs for the averaging group. The quarterly compliance reports must be submitted no later than 60 days after the end of each calendar quarter.
9. The semiannual compliance reports described in 40 CFR 63.10031(c) and (d), in PDF files, according to 40 CFR 63.10031(f)(4) and (6). The due dates for these reports are specified in 40 CFR 63.10031(b). The final semiannual compliance report shall cover the period from July 1, 2023, through December 31, 2023.
10. Notifications of compliance status, in PDF files, according to 40 CFR 63.10031(f)(4) and (6) until December 31, 2023, and according to 40 CFR 63.10031(h) thereafter.
11. Quarterly electronic compliance reports, in accordance with 40 CFR 63.10031(g), starting with a report for the first calendar quarter of 2024. The reports must be in XML format and must include the applicable data elements in sections 2 through 13 of appendix E to this subpart. These reports are due no later than 60 days after the end of each calendar quarter.
12. Quarterly reports, in PDF files, that include the applicable information in 40 CFR 63.10031(c)(5)(ii) and 40 CFR 63.10020(e) pertaining to startup and shutdown events, starting with a report for the first calendar quarter of 2024, if you have elected to use paragraph 2 of the definition of startup in 40 CFR 63.10042 (see 40 CFR 63.10031(i)). These PDF reports shall be submitted no later than 60 days after the end of each calendar quarter, along with the quarterly compliance reports required under 40 CFR 63.10031(g).
13. A test report for the PS 11 correlation test of your PM CEMS, in accordance with 40 CFR 63.10031(j). If, prior to November 9, 2020, you have begun using a certified PM CEMS to demonstrate compliance with this subpart, use the ECMPS Client Tool to submit the report, in a PDF file, no later than 60 days after that date. For correlation tests completed on or after November 9, 2020, but prior to January 1, 2024, submit the report, in a PDF file, no later than 60 days after the date on which the test is completed. For correlation tests completed on or after January 1, 2024, submit the test results electronically, according to section 7.2.4 of appendix C to this subpart, together with the applicable reference method data in sections 17 through 31 of appendix E to this subpart.
14. Quarterly reports that include the QA/QC activities for your PM CPMS or approved HAP metals CEMS (as applicable), in PDF files, according to 40 CFR 63.10031(k). The first report shall cover the first calendar quarter of 2024, if the PM CPMS or HAP metals CEMS is in use during that quarter. Otherwise, reporting begins with the first calendar quarter in which the PM CPMS or HAP metals CEMS is used to demonstrate compliance. These reports are due no later than 60 days after the end of each calendar quarter.

* * * * *

■ 15. Table 9 to subpart UUUUU is amended by:

■ a. Revising the entries ''63.9''and ''63.10(c)(7) and (8)''; and

■ b. Adding the entry ''§ 63.10(e)(3)(v) and (vi)''.

The addition and revision read as follows:

TABLE 9 TO SUBPART UUUUU OF PART 63—APPLICABILITY OF GENERAL PROVISIONS TO SUBPART UUUUU

[* * * * * * *]

Citation	Subject	Applies to subpart UUUUU
*	* *	* * * * *
§ 63.9	Notification Requirements	Yes, except (1) for the 60-day notification prior to conducting a performance test in § 63.9(e); instead use a 30-day notification period per § 63.10030(d), (2) the notification of the CMS performance evaluation in § 63.9(g)(1) is limited to RATAs, and (3) the information required per § 63.9(h)(2)(i); instead provide the applicable information in § 63.10030(e)(1) through (8), for the initial notification of compliance status, only.
*	* *	* * * * *
§ 63.10(c)(7)	Additional recordkeeping requirements for CMS — identifying exceedances and excess emissions.	Applies only through December 31, 2023.
§ 63.10(c)(8)	Additional recordkeeping requirements for CMS—identifying exceedances and excess emissions.	Applies only through December 31, 2023.
*	* *	* * * * *
§ 63.10(e)(3)(v) and (vi)	Excess emissions and CMS performance reports.	Applies only through December 31, 2023.
*	* *	* * * * *

■ 16. Appendix A to subpart UUUUU is amended by revising sections 5.1.1, 7.1.1.2.1, 7.1.3.3, 7.1.4.3, 7.1.8.2, and 7.2.3.1 to read as follows:

Appendix A to Subpart UUUUU of Part 63—HG Monitoring Provisions

* * * * *

5. Ongoing Quality Assurance (QA) and Data Validation

* * * * *

5.1.1 *Required QA Tests.* Periodic QA testing of each Hg CEMS is required following initial certification. The required QA tests, the test frequencies, and the performance specifications that must be met are summarized in Table A–2, below. All tests must be performed with the affected unit(s) operating (*i.e.,* combusting fuel), however, the daily calibration may optionally be performed off-line. The RATA must be performed at normal load, but no particular load level is required for the other tests. For each test, follow the same basic procedures in section 4.1.1 of this appendix that were used for initial certification.

* * * * *

7. Recordkeeping and Reporting

* * * * *

7.1.1.2.1 *Electronic.* The electronic monitoring plan records must include the following: unit or stack ID number(s); monitoring location(s); the Hg monitoring methodologies used; emissions controls; Hg monitoring system information, including, but not limited to: Unique system and component ID numbers; the make, model, and serial number of the monitoring equipment; the sample acquisition method; formulas used to calculate Hg emissions; and Hg monitor span and range information. The electronic monitoring plan shall be evaluated and submitted using the ECMPS Client Tool provided by the Clean Air Markets Division in the Office of Atmospheric Programs of the EPA.

* * * * *

7.1.3.3 The hourly Hg concentration, if a quality-assured value is obtained for the hour (µg/scm, with one leading non-zero digit and one decimal place, expressed in scientific notation). Use the following rounding convention: If the digit immediately following the first decimal place is 5 or greater, round the first decimal place upward (increase it by one); if the digit immediately following the first decimal place is 4 or less, leave the first decimal place unchanged;

* * * * *

7.1.4.3 The hourly Hg concentration, if a quality-assured value is obtained for the hour (µg/scm, with one leading non-zero digit and one decimal place, expressed in scientific notation). Use the following rounding convention: If the digit immediately following the first decimal place is 5 or greater, round the first decimal place upward (increase it by one); if the digit immediately following the first decimal place is 4 or less, leave the first decimal place unchanged. Note that when a single quality-assured Hg concentration value is obtained for a particular data collection period, that single concentration value is applied to each operating hour of the data collection period.

* * * * *

7.1.8.2 The hourly Hg emissions rate (lb/TBtu or lb/GWh, as applicable), calculated according to section 6.2.1 or 6.2.2 of this appendix, rounded to the same precision as the standard (*i.e.,* with one leading non-zero digit and one decimal place, expressed in scientific notation), if valid values of Hg concentration and all other required parameters (stack gas volumetric flow rate, diluent gas concentration, electrical load, and moisture data, as applicable) are obtained for the hour. Use the following rounding convention: If the digit immediately following the first decimal place is 5 or greater, round the first decimal place upward (increase it by one); if the digit immediately following the first decimal place is 4 or less, leave the first decimal place unchanged;

* * * * *

7.2.3.1 For an EGU that begins reporting hourly Hg concentrations with a previously-certified Hg monitoring system, submit the monitoring plan information in section 7.1.1.2 of this appendix prior to or concurrent with the first required quarterly emissions report. For a new EGU, or for an EGU switching to continuous monitoring of Hg emissions after having implemented another allowable compliance option under this subpart, submit the information in section 7.1.1.2 of this appendix at least 21 days prior to the start of initial certification testing of the CEMS. Also submit the monitoring plan information in section 75.53(g) pertaining to any required flow rate, diluent gas, and moisture monitoring systems within the applicable time frame specified in this section, if the required records are not already in place.

* * * * *

■ 17. Appendix B to subpart UUUUU is amended by:

■ a. Revising the heading and introductory text of section 2.3;

■ b. Revising sections 9.4, 10.1.3.3, 10.1.7.2, 10.1.8.1.1, 10.1.8.1.2, and 10.1.8.1.3;

■ c. Adding sections 10.1.8.1.4 through 10.1.8.1.12;
■ d. Revising sections 11.3.1, 11.4 introductory text, and 11.4.1;
■ e. Adding sections 11.4.1.1 through 11.4.1.9;
■ f. Revising section 11.4.2 introductory text;
■ g. Revising sections 11.4.3.11 and 11.4.3.12;
■ h. Re-designating section 11.4.3.13 as 11.4.3.14;
■ i. Adding new section 11.4.3.13;
■ j. Re-designating section 11.4.4 as 11.4.13;
■ k. Adding sections: 11.4.4 introductory text; 11.4.4.1 through 11.4.4.7; 11.4.5 introductory text; 11.4.5.1; 11.4.5.1.1 through 11.4.5.1.9; 11.4.5.2 introductory text; 11.4.5.2.1 through 11.4.5.2.6; 11.4.6 introductory text; 11.4.6.1 through 11.4.6.8, 11.4.7 introductory text; 11.4.7.1 through 11.4.7.6; 11.4.8 introductory text; 11.4.8.1 through 11.4.8.15; 11.4.9 introductory text; 11.4.9.1 through 11.4.9.5; 11.4.10 introductory text; 11.4.10.1 through 11.4.10.8; 11.4.11 introductory text; 11.4.11.1 through 11.4.11.7; 11.4.12 introductory text; 11.4.12.1 through 11.4.12.9; and 11.4.13; and revising section 11.5.1.

The revisions and additions read as follows:

Appendix B to Subpart UUUUU of Part 63—HC_L and HF Monitoring Provisions

* * * * *

2. Monitoring of HC_L and/or HF Emissions

* * * * *

2.3 *Monitoring System Equipment, Supplies, Definitions, and General Operation.*

The following provisions apply:

* * * * *

9. Data Reduction and Calculations

* * * * *

9.4 Use Equation A–5 in appendix A of this subpart to calculate the required 30-boiler operating day rolling average HCl or HF emission rates. Report each 30-boiler operating day rolling average to the same precision as the standard (*i.e.,* with one leading non-zero digit and one decimal place), expressed in scientific notation. The term E_{ho} in Equation A–5 must be in the units of the applicable emissions limit.

* * * * *

10. Recordkeeping Requirements

* * * * *

10.1.3.3 The pollutant concentration, for each hour in which a quality-assured value is obtained. For HCl and HF, record the data in parts per million (ppm), with one leading non-zero digit and one decimal place, expressed in scientific notation. Use the following rounding convention: If the digit immediately following the first decimal place is 5 or greater, round the first decimal place upward (increase it by one); if the digit immediately following the first decimal place is 4 or less, leave the first decimal place unchanged.

* * * * *

10.1.7.2 The hourly HCl and/or HF emissions rate (lb/MMBtu, or lb/MWh, as applicable), for each hour in which valid values of HCl or HF concentration and all other required parameters (stack gas volumetric flow rate, diluent gas concentration, electrical load, and moisture data, as applicable) are obtained for the hour. Round off the emission rate to the same precision as the standard (*i.e.,* with one leading non-zero digit and one decimal place, expressed in scientific notation). Use the following rounding convention: If the digit immediately following the first decimal place is 5 or greater, round the first decimal place upward (increase it by one); if the digit immediately following the first decimal place is 4 or less, leave the first decimal place unchanged;

* * * * *

10.1.8.1.1 For each required 7-day and daily calibration drift test or daily calibration error test (including daily calibration transfer standard tests) of the HCl or HF CEMS, record the test date(s) and time(s), reference gas value(s), monitor response(s), and calculated calibration drift or calibration error value(s). If you use the dynamic spiking option for the mid-level calibration drift check under PS–18, you must also record the measured concentration of the native HCl in the flue gas before and after the spike and the spiked gas dilution factor. When using an IP–CEMS under PS–18, you must also record the measured concentrations of the native HCl before and after introduction of each reference gas, the path lengths of the calibration cell and the stack optical path, the stack and calibration cell temperatures, the instrument line strength factor, and the calculated equivalent concentration of reference gas.

10.1.8.1.2 For the required gas audits of an FTIR HCl or HF CEMS that is following PS 15, record the date and time of each spiked and unspiked sample, the audit gas reference values and uncertainties. Keep records of all calculations and data analyses required under sections 9.1 and 12.1 of Performance Specification 15, and the results of those calculations and analyses.

10.1.8.1.3 For each required RATA of an HCl or HF CEMS, record the beginning and ending date and time of each test run, the reference method(s) used, and the reference method and HCl or HF CEMS run values. Keep records of stratification tests performed (if any), all of the raw field data, relevant process operating data, and all of the calculations used to determine the relative accuracy.

10.1.8.1.4 For each required beam intensity test of an HCl IP–CEMS under PS–18, record the test date and time, the known attenuation value (%) used for the test, the concentration of the high-level reference gas used, the full-beam and attenuated beam intensity levels, the measured HCl concentrations at full-beam intensity and attenuated intensity and the percent difference between them, and the results of the test. For each required daily beam intensity check of an IP–CEMS under Procedure 6, record the beam intensity measured including the units of measure and the results of the check.

10.1.8.1.5 For each required measurement error (ME) test of an HCl monitor, record the date and time of each gas injection, the reference gas concentration (low, mid, or high) and the monitor response for each of the three injections at each of the three levels. Also record the average monitor response and the ME at each gas level and the related calculations. For ME tests conducted on IP–CEMS, also record the measured concentrations of the native HCl before and after introduction of each reference gas, the path lengths of the calibration cell and the stack optical path, the stack and calibration cell temperatures, the stack and calibration cell pressures, the instrument line strength factor, and the calculated equivalent concentration of reference gas.

10.1.8.1.6 For each required level of detection (LOD) test of an HCl monitor performed in a controlled environment, record the test date, the concentrations of the reference gas and interference gases, the results of the seven (or more) consecutive measurements of HCl, the standard deviation, and the LOD value. For each required LOD test performed in the field, record the test date, the three measurements of the native source HCl concentration, the results of the three independent standard addition (SA) measurements known as standard addition response (SAR), the effective spike addition gas concentration (for IP–CEMS, the equivalent concentration of the reference gas), the resulting standard addition detection level (SADL) value and all related calculations. For extractive CEMS performing the SA using dynamic spiking, you must record the spiked gas dilution factor.

10.1.8.1.7 For each required ME/level of detection response time test of an HCl monitor, record the test date, the native HCl concentration of the flue gas, the reference gas value, the stable reference gas readings, the upscale/downscale start and end times, and the results of the upscale and downscale stages of the test.

10.1.8.1.8 For each required temperature or pressure measurement verification or audit of an IP–CEMS, keep records of the test date, the temperatures or pressures (as applicable) measured by the calibrated temperature or pressure reference device and the IP–CEMS, and the results of the test.

10.1.8.1.9 For each required interference test of an HCl monitor, record (or obtain from the analyzer manufacturer records of): The date of the test; the gas volume/rate, temperature, and pressure used to conduct the test; the HCl concentration of the reference gas used; the concentrations of the interference test gases; the baseline HCl and HCl responses for each interferent combination spiked; and the total percent interference as a function of span or HCl concentration.

10.1.8.1.10 For each quarterly relative accuracy audit (RAA) of an HCl monitor, record the beginning and ending date and time of each test run, the reference method

used, the HCl concentrations measured by the reference method and CEMS for each test run, the average concentrations measured by the reference method and the CEMS, and the calculated relative accuracy. Keep records of the raw field data, relevant process operating data, and the calculations used to determine the relative accuracy.

10.1.8.1.11 For each quarterly cylinder gas audit (CGA) of an HCl monitor, record the date and time of each injection, and the reference gas concentration (zero, mid, or high) and the monitor response for each injection. Also record the average monitor response and the calculated ME at each gas level. For IP–CEMS, you must also record the measured concentrations of the native HCl before and after introduction of each reference gas, the path lengths of the calibration cell and the stack optical path, the stack and calibration cell temperatures, the stack and calibration cell pressures, the instrument line strength factor, and the calculated equivalent concentration of reference gas.

10.1.8.1.12 For each quarterly dynamic spiking audit (DSA) of an HCl monitor, record the date and time of the zero gas injection and each spike injection, the results of the zero gas injection, the gas concentrations (mid and high) and the dilution factors and the monitor response for each of the six upscale injections as well as the corresponding native HCl concentrations measured before and after each injection. Also record the average dynamic spiking error for each of the upscale gases, the calculated average DSA Accuracy at each upscale gas concentration, and all calculations leading to the DSA Accuracy.

* * * * *

11. Reporting Requirements

* * * * *

11.3.1 For an EGU that begins reporting hourly HCl and/or HF concentrations with a previously-certified CEMS, submit the monitoring plan information in section 10.1.1.2 of this appendix prior to or concurrent with the first required quarterly emissions report. For a new EGU, or for an EGU switching to continuous monitoring of HCl and/or HF emissions after having implemented another allowable compliance option under this subpart, submit the information in section 10.1.1.2 of this appendix at least 21 days prior to the start of initial certification testing of the CEMS. Also submit the monitoring plan information in section 75.53(g) pertaining to any required flow rate, diluent gas, and moisture monitoring systems within the applicable time frame specified in this section, if the required records are not already in place.

* * * * *

11.4 *Certification, Recertification, and Quality-Assurance Test Reporting Requirements.* Except for daily QA tests (*i.e.,* calibrations and flow monitor interference checks), which are included in each electronic quarterly emissions report, use the ECMPS Client Tool to submit the results of all required certification, recertification, quality-assurance, and diagnostic tests of the monitoring systems required under this appendix electronically. Submit the test results either prior to or concurrent with the relevant quarterly electronic emissions report. However, for RATAs of the HCl monitor, if this is not possible, you have up to 60 days after the test completion date to submit the test results; in this case, you may claim provisional status for the emissions data affected by the test, starting from the date and hour in which the test was completed and continuing until the date and hour in which the test results are submitted. If the test is successful, the status of the data in that time period changes from provisional to quality-assured, and no further action is required. However, if the test is unsuccessful, the provisional data must be invalidated and resubmission of the affected emission report(s) is required.

11.4.1 For each daily calibration drift (or calibration error) assessment (including daily calibration transfer standard tests), and for each 7-day calibration drift test of an HCl or HF monitor, report:

11.4.1.1 Facility ID information;

11.4.1.2 The monitoring component ID;

11.4.1.3 The instrument span and span scale;

11.4.1.4 For each gas injection, the date and time, the calibration gas level (zero, mid or other), the reference gas value (ppm), and the monitor response (ppm);

11.4.1.5 A flag to indicate whether dynamic spiking was used for the upscale value (extractive HCl monitors only);

11.4.1.6 Calibration drift or calibration error (percent of span or reference gas, as applicable);

11.4.1.7 When using the dynamic spiking option, the measured concentration of native HCl before and after each mid-level spike and the spiked gas dilution factor;

11.4.1.8 When using an IP–CEMS, also report the measured concentration of native HCl before and after each upscale measurement, the path lengths of the calibration cell and the stack optical path, the stack and calibration cell temperatures, the stack and calibration cell pressures, the instrument line strength factor, and the equivalent concentration of the reference gas; and

11.4.1.9 Reason for test (for the 7-day CD test, only).

11.4.2 For each quarterly gas audit of an HCl or HF CEMS that is following PS 15, report:

* * * * *

11.4.3.11 Standard deviation, using either Equation 2–4 in section 12.3 of PS 2 in appendix B to part 60 of this chapter or Equation 10 in section 12.6.5 of PS 18;

11.4.3.12 Confidence coefficient, using either Equation 2–5 in section 12.4 of PS 2 in appendix B to part 60 of this chapter or Equation 11 in section 12.6.6 of PS 18;

11.4.3.13 t-value; and

11.4.3.14 *Relative Accuracy.* For FTIR monitoring systems following PS 15, calculate the relative accuracy using Equation 2–6 of PS 2 in appendix B to part 60 of this chapter or, if applicable, according to the alternative procedure for low emitters described in section 3.1.2.2 of this appendix. For HCl CEMS following PS 18, calculate the relative accuracy according to section 12.6 of PS 18. If applicable use a flag to indicate that the alternative relative accuracy specification for low emitters has been applied.

11.4.4 For each 3-level ME test of an HCl monitor, report:

11.4.4.1 Facility ID information;

11.4.4.2 Monitoring component ID;

11.4.4.3 Instrument span and span scale;

11.4.4.4 For each gas injection, the date and time, the calibration gas level (low, mid, or high), the reference gas value in ppm and the monitor response. When using an IP–CEMS, also report the measured concentration of native HCl before and after each injection, the path lengths of the calibration cell and the stack optical path, the stack and calibration cell temperatures, the stack and calibration cell pressures, the instrument line strength factor, and the equivalent concentration of the reference gas;

11.4.4.5 For extractive CEMS, the mean reference value and mean of measured values at each reference gas level (ppm). For IP–CEMS, the mean of the measured concentration minus the average measured native concentration minus the equivalent reference gas concentration (ppm), at each reference gas level—see Equation 6A in PS 18;

11.4.4.6 ME at each reference gas level; and

11.4.4.7 Reason for test.

11.4.5 Beam intensity tests of an IP CEMS:

11.4.5.1 For the initial beam intensity test described in PS 18 in appendix B to part 60 of this chapter, report:

11.4.5.1.1 Facility ID information;

11.4.5.1.2 Date and time of the test;

11.4.5.1.3 Monitoring system ID;

11.4.5.1.4 Reason for test;

11.4.5.1.5 Attenuation value (%);

11.4.5.1.6 High level gas concentration (ppm);

11.4.5.1.7 Full and attenuated beam intensity levels, including units of measure;

11.4.5.1.8 Measured HCl concentrations at full and attenuated beam intensity (ppm); and

11.4.5.1.9 Percentage difference between the HCl concentrations.

11.4.5.2 For the daily beam intensity check described in Procedure 6 of appendix F to Part 60 of this chapter, report:

11.4.5.2.1 Facility ID information;

11.4.5.2.2 Date and time of the test;

11.4.5.2.3 Monitoring system ID;

11.4.5.2.4 The attenuated beam intensity level (limit) established in the initial test;

11.4.5.2.5 The beam intensity measured during the daily check; and

11.4.5.2.6 Results of the test (pass or fail).

11.4.6 For each temperature or pressure verification or audit of an HCl IP–CEMS, report:

11.4.6.1 Facility ID information;

11.4.6.2 Date and time of the test;

11.4.6.3 Monitoring system ID;

11.4.6.4 Type of verification (temperature or pressure);

11.4.6.5 Stack sensor measured value;

11.4.6.6 Reference device measured value;

11.4.6.7 Results of the test (pass or fail); and

11.4.6.8 Reason for test.

11.4.7 For each interference test of an HCl monitoring system, report:

11.4.7.1 Facility ID information;
11.4.7.2 Date of test;
11.4.7.3 Monitoring system ID;
11.4.7.4 Results of the test (pass or fail);
11.4.7.5 Reason for test; and
11.4.7.6 A flag to indicate whether the test was performed: On this particular monitoring system; on one of multiple systems of the same type; or by the manufacturer on a system with components of the same make and model(s) as this system.
11.4.8 For each LOD test of an HCl monitor, report:
11.4.8.1 Facility ID information;
11.4.8.2 Date of test;
11.4.8.3 Reason for test;
11.4.8.4 Monitoring system ID;
11.4.8.5 A code to indicate whether the test was done in a controlled environment or in the field;
11.4.8.6 HCl reference gas concentration;
11.4.8.7 HCl responses with interference gas (seven repetitions);
11.4.8.8 Standard deviation of HCl responses;
11.4.8.9 Effective spike addition gas concentrations;
11.4.8.10 HCl concentration measured without spike;
11.4.8.11 HCl concentration measured with spike;
11.4.8.12 Dilution factor for spike;
11.4.8.13 The controlled environment LOD value (ppm or ppm-meters);
11.4.8.14 The field determined standard addition detection level (SADL in ppm or ppm-meters); and
11.4.8.15 Result of LDO/SADL test (pass/fail).
11.4.9 For each ME or LOD response time test of an HCl monitor, report:
11.4.9.1 Facility ID information;
11.4.9.2 Date of test;
11.4.9.3 Monitoring component ID;
11.4.9.4 The higher of the upscale or downscale tests, in minutes; and
11.4.9.5 Reason for test.
11.4.10 For each quarterly RAA of an HCl monitor, report:
11.4.10.1 Facility ID information;
11.4.10.2 Monitoring system ID;
11.4.10.3 Begin and end time of each test run;
11.4.10.4 The reference method used;
11.4.10.5 The reference method and CEMS values for each test run, including the units of measure;
11.4.10.6 The mean reference method and CEMS values for the three test runs;
11.4.10.7 The calculated relative accuracy, percent; and
11.4.10.8 Reason for test.
11.4.11 For each quarterly cylinder gas audit of an HCl monitor, report:
11.4.11.1 Facility ID information;
11.4.11.2 Monitoring component ID;
11.4.11.3 Instrument span and span scale;
11.4.11.4 For each gas injection, the date and time, the reference gas level (zero, mid, or high), the reference gas value in ppm, and the monitor response. When using an IP–CEMS, also report the measured concentration of native HCl before and after each injection, the path lengths of the calibration cell and the stack optical path, the stack and calibration cell temperatures, the stack and calibration cell pressures, the instrument line strength factor, and the equivalent concentration of the reference gas;
11.4.11.5 For extractive CEMS, the mean reference gas value and mean monitor response at each reference gas level (ppm). For IP–CEMS, the mean of the measured concentration minus the average measured native concentration minus the equivalent reference gas concentration (ppm), at each reference gas level -see Equation 6A in PS 18;
11.4.11.6 ME at each reference gas level; and
11.4.11.7 Reason for test.
11.4.12 For each quarterly DSA of an HCl monitor, report:
11.4.12.1 Facility ID information;
11.4.12.2 Monitoring component ID;
11.4.12.3 Instrument span and span scale;
11.4.12.4 For the zero gas injection, the date and time, and the monitor response (*Note:* The zero gas injection from a calibration drift check performed on the same day as the upscale spikes may be used for this purpose.);
11.4.12.5 Zero spike error;
11.4.12.6 For the upscale gas spiking, the date and time of each spike, the reference gas level (mid- or high-), the reference gas value (ppm), the dilution factor, the native HCl concentrations before and after each spike, and the monitor response for each gas spike;
11.4.12.7 Upscale spike error;
11.4.12.8 DSA at the zero level and at each upscale gas level; and
11.4.12.9 Reason for test.
11.4.13 *Reporting Requirements for Diluent Gas, Flow Rate, and Moisture Monitoring Systems.* For the certification, recertification, diagnostic, and QA tests of stack gas flow rate, moisture, and diluent gas monitoring systems that are certified and quality-assured according to part 75 of this chapter, report the information in section 10.1.8.2 of this appendix.

* * * * *

11.5.1 The owner or operator of any affected unit shall use the ECMPS Client Tool to submit electronic quarterly reports to the Administrator in an XML format specified by the Administrator, for each affected unit (or group of units monitored at a common stack). If the certified HCl or HF CEMS is used for the initial compliance demonstration, HCl or HF emissions reporting shall begin with the first operating hour of the 30-boiler operating day compliance demonstration period. Otherwise, HCl or HF emissions reporting shall begin with the first operating hour after successfully completing all required certification tests of the CEMS.

* * * * *

■ 18. Subpart UUUUU of part 63 is amended by adding appendix C to read as follows:

Appendix C to Subpart UUUUU of Part 63—PM Monitoring Provisions

1. General Provisions

1.1 *Applicability.* These monitoring provisions apply to the continuous measurement of filterable PM emissions from affected EGUs under this subpart. A PM CEMS is used together with other CMS and (as applicable) parametric measurement devices to quantify PM emissions in units of the applicable standard (*i.e.,* lb/MMBtu or lb/MWh).

1.2 *Initial Certification and Recertification Procedures.*

You, as the owner or operator of an affected EGU that uses a PM CEMS to demonstrate compliance with a filterable PM emissions limit in Table 1 or 2 to this subpart must certify and, if applicable, recertify the CEMS according to PS–11 in appendix B to part 60 of this chapter.

1.3 *Quality Assurance and Quality Control Requirements.* You must meet the applicable quality assurance requirements of Procedure 2 in appendix F to part 60 of this chapter.

1.4 *Missing Data Procedures.* You must not substitute data for missing data from the PM CEMS. Any process operating hour for which quality-assured PM concentration data are not obtained is counted as an hour of monitoring system downtime.

1.5 *Adjustments for Flow System Bias.* When the PM emission rate is reported on a gross output basis, you must not adjust the data recorded by a stack gas flow rate monitor for bias, which may otherwise be required under section 75.24 of this chapter.

2. Monitoring of PM Emissions

2.1 *Monitoring System Installation Requirements.* Flue gases from the affected EGUs under this subpart vent to the atmosphere through a variety of exhaust configurations including single stacks, common stack configurations, and multiple stack configurations. For each of these configurations, 40 CFR 63.10010(a) specifies the appropriate location(s) at which to install CMS. These CMS installation provisions apply to the PM CEMS and to the other CMS and parametric monitoring devices that provide data for the PM emissions calculations in section 6 of this appendix.

2.2 *Primary and Backup Monitoring Systems.* In the electronic monitoring plan described in section 7 of this appendix, you must create and designate a primary monitoring system for PM and for each additional parameter (*i.e.,* stack gas flow rate, CO_2 or O_2 concentration, stack gas moisture content, as applicable). The primary system must be used to report hourly PM concentration values when the system is able to provide quality-assured data, *i.e.,* when the system is ''in control.'' However, to increase data availability in the event of a primary monitoring system outage, you may install, operate, maintain, and calibrate a redundant backup monitoring system. A redundant backup system is one that is permanently installed at the unit or stack location and is kept on ''hot standby'' in case the primary monitoring system is unable to provide quality-assured data. You must represent each redundant backup system as a unique monitoring system in the electronic monitoring plan. You must certify each redundant backup monitoring system according to the applicable provisions in section 4 of this appendix. In addition, each redundant monitoring system must meet the applicable on-going QA requirements in section 5 of this appendix.

3. PM Emissions Measurement Methods

The following definitions, equipment specifications, procedures, and performance criteria are applicable

3.1 *Definitions.* All definitions specified in section 3 of PS–11 in appendix B to part 60 of this chapter and section 3 of Procedure 2 in appendix F to part 60 of this chapter are applicable to the measurement of filterable PM emissions from electric utility steam generating units under this subpart. In addition, the following definitions apply:

3.1.1 *Stack operating hour* means a clock hour during which flue gases flow through a particular stack or duct (either for the entire hour or for part of the hour) while the associated unit(s) are combusting fuel.

3.1.2 *Unit operating hour* means a clock hour during which a unit combusts any fuel, either for part of the hour or for the entire hour.

3.2 *Continuous Monitoring Methods.*

3.2.1 Installation and Measurement Location. You must install the PM CEMS according to 40 CFR 63.10010 and Section 2.4 of PS–11.

3.2.2 Units of Measure. For the purposes of this subpart, you shall report hourly PM concentrations in units of measure that correspond to your PM CEMS correlation curve (*e.g.,* mg/acm, mg/acm @ 160 °C, mg/wscm, mg/dscm).

3.2.3 Other Necessary Data Collection. To convert hourly PM concentrations to the units of the applicable emissions standard (*i.e.,* lb/MMBtu or lb/MWh), you must collect additional data as described in sections 3.2.3.1 and 3.2.3.2 of this appendix. You must install, certify, operate, maintain, and quality-assure any stack gas flow rate, CO_2, O_2, or moisture monitoring systems needed for this purpose according to sections 4 and 5 of this appendix. The calculation methods for the emission limits described in sections 3.2.3.1 and 3.2.3.2 of this appendix are presented in section 6 of this appendix.

3.2.3.1 Heat Input-Based Emission Limits. To demonstrate compliance with a heat input-based PM emission limit in Table 2 to this subpart, you must provide the hourly stack gas CO_2 or O_2 concentration, along with a fuel-specific F_c factor or dry-basis F-factor and (if applicable) the stack gas moisture content, in order to convert measured PM concentrations values to the units of the standard.

3.2.3.2 Gross Output-Based Emission Limits. To demonstrate compliance with a gross output-based PM emission limit in Table 1 or Table 2 to this subpart, you must provide the hourly gross output in megawatts, along with data from a certified stack gas flow rate monitor and (if applicable) the stack gas moisture content, in order to convert measured PM concentrations values to units of the standard.

4. Certification and Recertification Requirements

4.1 *Certification Requirements.* You must certify your PM CEMS and the other CMS used to determine compliance with the applicable emissions standard before the PM CEMS can be used to provide data under this subpart. Redundant backup monitoring systems (if used) are subject to the same certification requirements as the primary systems.

4.1.1 PM CEMS. You must certify your PM CEMS according to PS–11 in appendix B to part 60 of this chapter. A PM CEMS that has been installed and certified according to PS–11 as a result of another state or federal regulatory requirement or consent decree prior to the effective date of this subpart shall be considered certified for this subpart if you can demonstrate that your PM CEMS meets the PS–11 acceptance criteria based on the applicable emission standard in this subpart.

4.1.2 Flow Rate, Diluent Gas, and Moisture Monitoring Systems. You must certify the continuous monitoring systems that are needed to convert PM concentrations to units of the standard or (if applicable) to convert the measured PM concentrations from wet basis to dry basis or vice-versa (*i.e.,* stack gas flow rate, diluent gas (CO_2 or O_2) concentration, or moisture monitoring systems), in accordance with the applicable provisions in section 75.20 of this chapter and appendix A to part 75 of this chapter.

4.1.3 Other Parametric Measurement Devices. Any temperature or pressure measurement devices that are used to convert hourly PM concentrations to standard conditions must be installed, calibrated, maintained, and operated according to the manufacturers' instructions.

4.2 *Recertification.*

4.2.1 You must recertify your PM CEMS if it is either: moved to a different stack or duct; moved to a new location within the same stack or duct; modified or repaired in such a way that the existing correlation is altered or impacted; or replaced.

4.2.2 The flow rate, diluent gas, and moisture monitoring systems that are used to convert PM concentration to units of the emission standard are subject to the recertification provisions in section 75.20(b) of this chapter.

4.3 *Development of a New or Revised Correlation Curve.* You must develop a new or revised correlation curve if:

4.3.1 An RCA is failed and the new or revised correlation is developed according to section 10.6 in Procedure 2 of appendix F to part 60 of this chapter; or

4.3.2 The events described in paragraph (1) or (2) in section 8.8 of PS–11 occur.

5. Ongoing Quality Assurance (QA) and Data Validation

5.1 *PM CEMS.*

5.1.1 Required QA Tests. Following initial certification, you must conduct periodic QA testing of each primary and (if applicable) redundant backup PM CEMS. The required QA tests and the PS that must be met are found in Procedure 2 of appendix F to part 60 of this chapter (Procedure 2). Except as otherwise provided in section 5.1.2 of this appendix, the QA tests shall be done at the frequency specified in Procedure 2.

5.1.2 RRA and RCA Test Frequencies.

5.1.2.1 The test frequency for RRAs of the PM CEMS shall be annual, *i.e.,* once every 4 calendar quarters. The RRA must either be performed within the fourth calendar quarter after the calendar quarter in which the previous RRA was completed or in a grace period (see section 5.1.3, below). When a required annual RRA is done within a grace period, the deadline for the next RRA is 4 calendar quarters after the quarter in which the RRA was originally due, rather than the calendar quarter in which the grace period test is completed.

5.1.2.2 The test frequency for RCAs of the PM CEMS shall be triennial, *i.e.,* once every 12 calendar quarters. If a required RCA is not completed within 12 calendar quarters after the calendar quarter in which the previous RCA was completed, it must be performed in a grace period immediately following the twelfth calendar quarter (see section 5.1.3, below). When an RCA is done in a grace period, the deadline for the next RCA shall be 12 calendar quarters after the calendar quarter in which the RCA was originally due, rather than the calendar quarter in which the grace period test is completed.

5.1.2.3 Successive quarterly audits (*i.e.,* ACAs and, if applicable, sample volume audits (SVAs)) shall be conducted at least 60 days apart.

5.1.3 Grace Period. A grace period is available, immediately following the end of the calendar quarter in which an RRA or RCA of the PM CEMS is due. The length of the grace period shall be the lesser of 720 EGU (or stack) operating hours or 1 calendar quarter.

5.1.4 RCA and RRA Acceptability. The results of your RRA or RCA are considered acceptable provided that the criteria in section 10.4(5) of Procedure 2 in appendix F to part 60 of this chapter are met for an RCA or section 10.4(6) of Procedure 2 in appendix F to part 60 of this chapter are met for an RRA.

5.1.5 Data Validation. Your PM CEMS is considered to be out-of-control, and you may not report data from it as quality-assured, when, for a required certification, recertification, or QA test, the applicable acceptance criterion (either in PS–11 in appendix B to part 60 of this chapter or Procedure 2 in appendix F to part 60 of this chapter) is not met. Further, data from your PM CEMS are considered out-of-control, and may not be used for reporting, when a required QA test is not performed on schedule or within an allotted grace period. When an out-of-control period occurs, you must perform the appropriate follow-up actions. For an out-of-control period triggered by a failed QA test, you must perform and pass the same type of test in order to end the out-of-control period. For a QA test that is not performed on time, data from the PM CEMS remain out-of-control until the required test has been performed and passed. You must count all out-of-control data periods of the PM CEMS as hours of monitoring system downtime.

5.2 *Stack Gas Flow Rate, Diluent Gas, and Moisture Monitoring Systems.* The ongoing QA test requirements and data validation criteria for the primary and (if applicable) redundant backup stack gas flow rate, diluent gas, and moisture monitoring systems are specified in appendix B to part 75 of this chapter.

5.3 *QA/QC Program Requirements.* You must develop and implement a QA/QC program for the PM CEMS and the other equipment that is used to provide data under this subpart. You may store your QA/QC plan

electronically, provided that the information can be made available expeditiously in hard copy to auditors and inspectors.

5.3.1 General Requirements.

5.3.1.1 Preventive Maintenance. You must keep a written record of the procedures needed to maintain the PM CEMS and other equipment that is used to provide data under this subpart in proper operating condition, along with a schedule for those procedures. At a minimum, you must include all procedures specified by the manufacturers of the equipment and, if applicable, additional or alternate procedures developed for the equipment.

5.3.1.2 Recordkeeping Requirements. You must keep a written record describing procedures that will be used to implement the recordkeeping and reporting requirements of this appendix.

5.3.1.3 Maintenance Records. You must keep a record of all testing, maintenance, or repair activities performed on the PM CEMS, and other equipment used to provide data under this subpart in a location and format suitable for inspection. You may use a maintenance log for this purpose. You must maintain the following records for each system or device: The date, time, and description of any testing, adjustment, repair, replacement, or preventive maintenance action performed, and records of any corrective actions taken. Additionally, you must record any adjustment that may affect the ability of a monitoring system or measurement device to make accurate measurements, and you must keep a written explanation of the procedures used to make the adjustment(s).

5.3.2 Specific Requirements for the PM CEMS.

5.3.2.1 Daily, and Quarterly Quality Assurance Assessments. You must keep a written record of the procedures used for daily assessments of the PM CEMS. You must also keep records of the procedures used to perform quarterly ACA and (if applicable) SVA audits. You must document how the test results are calculated and evaluated.

5.3.2.2 Monitoring System Adjustments. You must document how each component of the PM CEMS will be adjusted to provide correct responses after routine maintenance, repairs, or corrective actions.

5.3.2.3 Correlation Tests, Annual and Triennial Audits. You must keep a written record of procedures used for the correlation test(s), annual RRAs, and triennial RCAs of the PM CEMS. You must document how the test results are calculated and evaluated.

5.3.3 Specific Requirements for Diluent Gas, Stack Gas Flow Rate, and Moisture Monitoring Systems. The QA/QC program requirements for the stack gas flow rate, diluent gas, and moisture monitoring systems described in section 3.2.3 of this appendix are specified in section 1 of appendix B to part 75 of this chapter.

5.3.4 Requirements for Other Monitoring Equipment. For the equipment required to convert readings from the PM CEMS to standard conditions (*e.g.,* devices to measure temperature and pressure), you must keep a written record of the calibrations and/or other procedures used to ensure that the devices provide accurate data.

5.3.5 You may store your QA/QC plan electronically, provided that you can make the information available expeditiously in hard copy to auditors or inspectors.

6. Data Reduction and Caculations

6.1 *Data Reduction and Validation.*

6.1.1 You must reduce the data from PM CEMS to hourly averages, in accordance with 40 CFR 60.13(h)(2) of this chapter.

6.1.2 You must reduce all CEMS data from stack gas flow rate, CO_2, O_2, and moisture monitoring systems to hourly averages according to 40 CFR 75.10(d)(1) of this chapter.

6.1.3 You must reduce all other data from devices used to convert readings from the PM CEMS to standard conditions to hourly averages according to 40 CFR 60.13(h)(2) or 40 CFR 75.10(d)(1) of this chapter. This includes, but is not limited to, data from devices used to measure temperature and pressure, or, for cogeneration units that calculate gross output based on steam characteristics, devices to measure steam flow rate, steam pressure, and steam temperature.

6.1.4 Do not calculate the PM emission rate for any unit or stack operating hour in which valid data are not obtained for PM concentration or for any parameter used in the PM emission rate calculations (*i.e.,* gross output, stack gas flow rate, stack temperature, stack pressure, stack gas moisture content, or diluent gas concentration, as applicable).

6.1.5 For the purposes of this appendix, part 75 substitute data values for stack gas flow rate, CO_2 concentration, O_2 concentration, and moisture content are not considered to be valid data.

6.1.6 Operating hours in which PM concentration is missing or invalid are hours of monitoring system downtime. The use of substitute data for PM concentration is not allowed.

6.1.7 You must exclude all data obtained during a boiler startup or shutdown operating hour (as defined in 40 CFR 63.10042) from the determination of the 30-boiler operating day rolling average PM emission rates.

6.2 *Calculation of PM Emission Rates.* Unless your PM CEMS is correlated to provide PM concentrations at standard conditions, you must use the calculation methods in sections 6.2.1 through 6.2.3 of this appendix to convert measured PM concentration values to units of the emission limit (lb/MMBtu or lb/MWh, as applicable).

6.2.1 PM concentrations must be at standard conditions in order to convert them to units of the emissions limit. If your PM CEMS measures PM concentrations at standard conditions, proceed to section 6.2.2 or 6.2.3, below (as applicable). However, if your PM CEMS measures PM concentrations in units of mg/acm or mg/acm at a specified temperature (*e.g.,* 160 °C), you must first use one of the following equations to convert the hourly PM concentration values from actual to standard conditions:

$$C_{std} = C_a \left(\frac{460 + T_s}{P_s} \right) \left(\frac{P_{std}}{460 + T_{std}} \right) \quad \text{(Eq. C-1)}$$

or

$$C_{std} = C_a \left(\frac{460 + T_{CEMS}}{P_{CEMS}} \right) \left(\frac{P_{std}}{460 + T_{std}} \right) \quad \text{(Eq. C-2)}$$

Where:

C_{std} = PM concentration at standard conditions

C_a = PM concentration at measurement conditions

T_s = Stack Temperature (°F)

T_{CEMS} = CEMS Measurement Temperature (°F)

P_{CEMS} = CEMS Measurement Pressure (in. Hg)

P_s = Stack Pressure (in. Hg)

T_{std} = Standard Temperature (68 °F)

P_{std} = Standard Pressure (29.92 in. Hg).

6.2.2 Heat Input-Based PM Emission Rates (Existing EGUs, Only). Calculate the hourly heat input-based PM emission rates (if applicable), in units of lb/MMBtu, according to sections 6.2.2.1 and 6.2.2.2 of this appendix.

6.2.2.1 You must select an appropriate emission rate equation from among Equations 19–1 through 19–9 in appendix A–7 to part 60 of this chapter to convert the hourly PM concentration values from section 6.2.1 of this appendix to units of lb/MMBtu. Note that the EPA test Method 19 equations require the pollutant concentration to be expressed in units of lb/scf; therefore, you must first multiply the PM

concentration by 6.24×10^{-8} to convert it from mg/scm to lb/scf.

6.2.2.2 You must use the appropriate carbon-based or dry-basis F-factor in the emission rate equation that you have selected. You may either use an F-factor from Table 19–2 of EPA test Method 19 in appendix A–7 to part 60 of this chapter or from section 3.3.5 or section 3.3.6 of appendix F to part 75 of this chapter.

6.2.2.3 If the hourly average O_2 concentration is above 14.0% O_2 (19.0% for an IGCC) or the hourly average CO_2 concentration is below 5.0% CO_2 (1.0% for an IGCC), you may calculate the PM emission rate using the applicable diluent cap value (as defined in 40 CFR 63.10042 and specified in 40 CFR 63.10007(f)(1)), provided that the diluent gas monitor is operating and recording quality-assured data).

6.2.2.4 If your selected EPA test Method 19 equation requires a correction for the stack gas moisture content, you may either use quality-assured hourly data from a certified part 75 moisture monitoring system, a fuel-specific default moisture value from 40 CFR 75.11(b) of this chapter, or a site-specific default moisture value approved by the Administrator under section 75.66 of this chapter.

6.2.3 Gross Output-Based PM Emission Rates. For each unit or stack operating hour, if C_{std} is measured on a wet basis, you must use Equation C–3 to calculate the gross output-based PM emission rate (if applicable). Use Equation C–4 if C_{std} is measured on a dry basis:

$$E_{heo} = 6.24\ x\ 10^{-8}\ \left(\frac{C_{std}\ Q_s}{MW}\right) \qquad \text{(Eq. C-3)}$$

Where:

E_{heo} = Hourly gross output-based PM emission rate (lb/MWh)

C_{std} = PM concentration from section 6.2.1 (mg/scm), wet basis

Q_s = Unadjusted stack gas volumetric flow rate (scfh, wet basis)

MW = Gross output (megawatts)

6.24×10^{-8} = Conversion factor

or

$$E_{heo} = 6.24\ x\ 10^{-8}\ \left(\frac{C_{std}\ Q_s}{MW}\right)\left(1 - B_{ws}\right) \qquad \text{(Eq. C-4)}$$

Where:

E_{heo} = Hourly gross output-based PM emission rate (lb/MWh)

C_{std} = PM concentration from section 6.2.1 (mg/scm), dry basis

Q_s = Unadjusted stack gas volumetric flow rate (scfh, wet basis)

MW = Gross output (megawatts)

B_{ws} = Proportion by volume of water vapor in the stack gas

6.24×10^{-8} = Conversion factor

6.2.4 You must calculate the 30–boiler operating day rolling average PM emission rates according to 40 CFR 63.10021(b).

7. Recordkeeping and Reporting

7.1 *Recordkeeping Provisions.* For the PM CEMS and the other necessary CMS and parameter measurement devices installed at each affected unit or common stack, you must maintain a file of all measurements, data, reports, and other information required by this appendix in a form suitable for inspection, for 5 years from the date of each record, in accordance with 40 CFR 63.10033. The file shall contain the applicable information in sections 7.1.1 through 7.1.11 of this appendix.

7.1.1 Monitoring Plan Records. For each EGU or group of EGUs monitored at a common stack, you must prepare and maintain a monitoring plan for the PM CEMS and the other CMS(s) needed to convert PM concentrations to units of the applicable emission standard.

7.1.1.1 Updates. If you make a replacement, modification, or change in a certified CEMS that is used to provide data under this appendix (including a change in the automated data acquisition and handling system (DAHS)) or if you make a change to the flue gas handling system and that replacement, modification, or change affects information reported in the monitoring plan (*e.g.,* a change to a serial number for a component of a monitoring system), you shall update the monitoring plan.

7.1.1.2 Contents of the Monitoring Plan. For the PM CEMS, your monitoring plan shall contain the applicable information in sections 7.1.1.2.1 and 7.1.1.2.2 of this appendix. For required stack gas flow rate, diluent gas, and moisture monitoring systems, your monitoring plan shall include the applicable information required for those systems under 40 CFR 75.53 (g) and (h) of this chapter.

7.1.1.2.1 Electronic. Your electronic monitoring plan records must include the following information: Unit or stack ID number(s); unit information (type of unit, maximum rated heat input, fuel type(s), emission controls); monitoring location(s); the monitoring methodologies used; monitoring system information, including (as applicable): Unique system and component ID numbers; the make, model, and serial number of the monitoring equipment; the sample acquisition method; formulas used to calculate emissions; operating range and load information; monitor span and range information; units of measure of your PM concentrations (see section 3.2.2); and appropriate default values. Your electronic monitoring plan shall be evaluated and submitted using the ECMPS Client Tool provided by the Clean Air Markets Division (CAMD) in EPA's Office of Atmospheric Programs.

7.1.1.2.2 Hard Copy. You must keep records of the following items: Schematics and/or blueprints showing the location of the PM monitoring system(s) and test ports; data flow diagrams; test protocols; and miscellaneous technical justifications. The hard copy portion of the monitoring plan must also explain how the PM concentrations are measured and how they are converted to the units of the applicable emissions limit. The equation(s) used for the conversions must be documented. Electronic storage of the hard copy portion of the monitoring plan is permitted.

7.1.2 Operating Parameter Records. You must record the following information for each operating hour of each EGU and also for each group of EGUs utilizing a monitored common stack, to the extent that these data are needed to convert PM concentration data to the units of the emission standard. For non-operating hours, you must record only the items in sections 7.1.2.1 and 7.1.2.2 of this appendix. If you elect to or are required to comply with a gross output-based PM standard, for any hour in which there is gross output greater than zero, you must record the items in sections 7.1.2.1 through 7.1.2.3 and (if applicable) 7.1.2.5 of this appendix; however, if there is heat input to the unit(s) but no gross output (*e.g.,* at unit startup), you must record the items in sections 7.1.2.1, 7.1.2.2, and, if applicable, section 7.1.2.5 of this appendix. If you elect to comply with a heat input-based PM standard, you must record only the items in sections 7.1.2.1, 7.1.2.2, 7.1.2.4, and, if applicable, section 7.1.2.5 of this appendix.

7.1.2.1 The date and hour;

7.1.2.2 The unit or stack operating time (rounded up to the nearest fraction of an hour (in equal increments that can range from 1 hundredth to 1 quarter of an hour, at your option);

7.1.2.3 The hourly gross output (rounded to nearest MWe);

7.1.2.4 If applicable, the F_c factor or dry-basis F-factor used to calculate the heat input-based PM emission rate; and

7.1.2.5 If applicable, a flag to indicate that the hour is an exempt startup or shutdown hour.

7.1.3 PM Concentration Records. For each affected unit or common stack using a PM CEMS, you must record the following

information for each unit or stack operating hour:

7.1.3.1 The date and hour;

7.1.3.2 Monitoring system and component identification codes for the PM CEMS, as provided in the electronic monitoring plan, if your CEMS provides a quality-assured value of PM concentration for the hour;

7.1.3.3 The hourly PM concentration, in units of measure that correspond to your PM CEMS correlation curve, for each operating hour in which a quality-assured value is obtained. Record all PM concentrations with one leading non-zero digit and one decimal place, expressed in scientific notation. Use the following rounding convention: If the digit immediately following the first decimal place is 5 or greater, round the first decimal place upward (increase it by one); if the digit immediately following the first decimal place is 4 or less, leave the first decimal place unchanged.

7.1.3.4 A special code, indicating whether or not a quality-assured PM concentration is obtained for the hour; and

7.1.3.5 Monitor data availability for PM concentration, as a percentage of unit or stack operating hours calculated in the manner established for SO_2, CO_2, O_2 or moisture monitoring systems according to 40 CFR 75.32 of this chapter.

7.1.4 Stack Gas Volumetric Flow Rate Records.

7.1.4.1 When a gross output-based PM emissions limit must be met, in units of lb/MWh, you must obtain hourly measurements of stack gas volumetric flow rate during EGU operation, in order to convert PM concentrations to units of the standard.

7.1.4.2 When hourly measurements of stack gas flow rate are needed, you must keep hourly records of the flow rates and related information, as specified in 40 CFR 75.57(c)(2) of this chapter.

7.1.5 Records of Diluent Gas (CO_2 or O_2) Concentration.

7.1.5.1 When a heat input-based PM emission limit must be met, in units of lb/MMBtu, you must obtain hourly measurements of CO_2 or O_2 concentration during EGU operation, in order to convert PM concentrations to units of the standard.

7.1.5.2 When hourly measurements of diluent gas concentration are needed, you must keep hourly CO_2 or O_2 concentration records, as specified in 40 CFR 75.57(g) of this chapter.

7.1.6 Records of Stack Gas Moisture Content.

7.1.6.1 When corrections for stack gas moisture content are needed to demonstrate compliance with the applicable PM emissions limit:

7.1.6.1.1 If you use a continuous moisture monitoring system, you must keep hourly records of the stack gas moisture content and related information, as specified in 40 CFR 75.57(c)(3) of this chapter.

7.1.6.1.2 If you use a fuel-specific default moisture value, you must represent it in the electronic monitoring plan required under section 7.1.1.2.1 of this appendix.

7.1.7 PM Emission Rate Records. For applicable PM emission limits in units of lb/MMBtu or lb/MWh, you must record the following information for each affected EGU or common stack:

7.1.7.1 The date and hour;

7.1.7.2 The hourly PM emissions rate (lb/MMBtu or lb/MWh, as applicable), calculated according to section 6.2.2 or 6.2.3 of this appendix, rounded to the same precision as the standard (*i.e.,* with one leading non-zero digit and one decimal place, expressed in scientific notation), expressed in scientific notation. Use the following rounding convention: If the digit immediately following the first decimal place is 5 or greater, round the first decimal place upward (increase it by one); if the digit immediately following the first decimal place is 4 or less, leave the first decimal place unchanged. You must calculate the PM emission rate only when valid values of PM concentration and all other required parameters required to convert PM concentration to the units of the standard are obtained for the hour;

7.1.7.3 An identification code for the formula used to derive the hourly PM emission rate from measurements of the PM concentration and other necessary parameters (*i.e.,* Equation C–3 or C–4 in section 6.2.3 of this appendix or the applicable EPA test Method 19 equation);

7.1.7.4 If applicable, indicate that the diluent cap has been used to calculate the PM emission rate; and

7.1.7.5 If applicable, indicate that the default electrical load (as defined in 40 CFR 63.10042) has been used to calculate the hourly PM emission rate.

7.1.7.6 Indicate that the PM emission rate was not calculated for the hour, if valid data are not obtained for PM concentration and/or any of the other parameters in the PM emission rate equation. For the purposes of this appendix, substitute data values for stack gas flow rate, CO_2 concentration, O_2 concentration, and moisture content reported under part 75 of this chapter are not considered to be valid data. However, when the gross output (as defined in 40 CFR 63.10042) is reported for an operating hour with zero output, the default electrical load value is treated as quality-assured data.

7.1.8 Other Parametric Data. If your PM CEMS measures PM concentrations at actual conditions, you must keep records of the temperatures and pressures used in Equation C–1 or C–2 to convert the measured hourly PM concentrations to standard conditions.

7.1.9 Certification, Recertification, and Quality Assurance Test Records. For any PM CEMS used to provide data under this subpart, you must record the following certification, recertification, and quality assurance information:

7.1.9.1 The test dates and times, reference values, monitor responses, monitor full scale value, and calculated results for the required 7-day drift tests and for the required daily zero and upscale calibration drift tests;

7.1.9.2 The test dates and times and results (pass or fail) of all daily system optics checks and daily sample volume checks of the PM CEMS (as applicable);

7.1.9.3 The test dates and times, reference values, monitor responses, and calculated results for all required quarterly ACAs;

7.1.9.4 The test dates and times, reference values, monitor responses, and calculated results for all required quarterly SVAs of extractive PM CEMS;

7.1.9.5 The test dates and times, reference method readings and corresponding PM CEMS responses (including the units of measure), and the calculated results for all PM CEMS correlation tests, RRAs and RCAs. For the correlation tests, you must indicate which model is used (*i.e.,* linear, logarithmic, exponential, polynomial, or power) and record the correlation equation. For the RRAs and RCAs, the reference method readings and PM CEMS responses must be reported in the same units of measure as the PM CEMS correlation;

7.1.9.6 The cycle time and sample delay time for PM CEMS that operate in batch sampling mode; and

7.1.9.7 Supporting information for all required PM CEMS correlation tests, RRAs, and RCAs, including records of all raw reference method and monitoring system data, the results of sample analyses to substantiate the reported test results, as well as records of sampling equipment calibrations, reference monitor calibrations, and analytical equipment calibrations.

7.1.10 For stack gas flow rate, diluent gas, and moisture monitoring systems, you must keep records of all certification, recertification, diagnostic, and on-going quality-assurance tests of these systems, as specified in 40 CFR 75.59(a) of this chapter.

7.1.11 For each temperature measurement device (*e.g.,* resistance temperature detector or thermocouple) and pressure measurement device used to convert measured PM concentrations to standard conditions according to Equation C–1 or C–2, you must keep records of all calibrations and other checks performed to ensure that accurate data are obtained.

7.2 *Reporting Requirements.*

7.2.1 General Reporting Provisions. You must comply with the following requirements for reporting PM emissions from each affected EGU (or group of EGUs monitored at a common stack) under this subpart:

7.2.1.1 Notifications, in accordance with section 7.2.2 of this appendix;

7.2.1.2 Monitoring plan reporting, in accordance with section 7.2.3 of this appendix;

7.2.1.3 Certification, recertification, and quality assurance test submittals, in accordance with section 7.2.4 of this appendix; and

7.2.1.4 Electronic quarterly emissions report submittals, in accordance with section 7.2.5 of this appendix.

7.2.2 Notifications. You must provide notifications for each affected unit (or group of units monitored at a common stack) under this subpart in accordance with 40 CFR 63.10030.

7.2.3 Monitoring Plan Reporting. For each affected unit (or group of units monitored at a common stack) under this subpart using PM CEMS to measure PM emissions, you must make electronic and hard copy monitoring plan submittals as follows:

7.2.3.1 For an EGU that begins reporting hourly PM concentrations on January 1, 2024, with a previously certified PM CEMS, submit the monitoring plan information in

section 7.1.1.2 of this appendix prior to or concurrent with the first required quarterly emissions report. For a new EGU, or for an EGU switching to continuous monitoring of PM emissions after having implemented another allowable compliance option under this subpart, submit the information in section 7.1.1.2 of this appendix at least 21 days prior to the start of initial certification testing of the PM CEMS. Also submit the monitoring plan information in 40 CFR 75.53(g) pertaining to any required flow rate, diluent gas, and moisture monitoring systems within the applicable time frame specified in this section, if the required records are not already in place.

7.2.3.2 Whenever an update of the monitoring plan is required, as provided in section 7.1.1.1 of this appendix, you must submit the updated information either prior to or concurrent with the relevant quarterly electronic emissions report.

7.2.3.3 All electronic monitoring plan submittals and updates shall be made to the Administrator using the ECMPS Client Tool. Hard copy portions of the monitoring plan shall be submitted to the appropriate delegated authority.

7.2.4 Certification, Recertification, and Quality-Assurance Test Reporting. Except for daily quality assurance tests of the required monitoring systems (*i.e.,* calibration error or drift tests, sample volume checks, system optics checks, and flow monitor interference checks), you must submit the results of all required certification, recertification, and quality-assurance tests described in sections 7.1.9.1 through 7.1.9.6 and 7.1.10 of this appendix electronically (except for test results previously submitted, *e.g.,* under the Acid Rain Program), using the ECMPS Client Tool. Submit the results of the quality assurance test (*i.e.,* RCA or RRA) or, if applicable, a new PM CEMS correlation test, either prior to or concurrent with the relevant quarterly electronic emissions report. If this is not possible, you have up to 60 days after the test completion date to submit the test results; in this case, you may claim provisional status for the emissions data affected by the quality assurance test or correlation, starting from the date and hour in which the test was completed and continuing until the date and hour in which the test results are submitted. For an RRA or RCA, if the applicable audit specifications are met, the status of the emissions data in the relevant time period changes from provisional to quality-assured, and no further action is required. For a successful correlation test, apply the correlation equation retrospectively to the raw data to change the provisional status of the data to quality-assured, and resubmit the affected emissions report(s). However, if the applicable performance specifications are not met, the provisional data must be invalidated, and resubmission of the affected quarterly emission report(s) is required. For a failed RRA or RCA, you must take corrective actions and proceed according to the applicable requirements found in sections 10.5 through 10.7 of Procedure 2 until a successful quality assurance test report is submitted. If a correlation test is unsuccessful, you may not report quality-assured data from the PM CEMS until the results of a subsequent correlation test show that the specifications in section 13.0 of PS 11 are met.

7.2.5 Quarterly Reports.

7.2.5.1 For each affected EGU (or group of EGUs monitored at a common stack), the owner or operator must use the ECMPS Client Tool to submit electronic quarterly emissions reports to the Administrator, in an XML format specified by the Administrator, starting with a report for the later of:

7.2.5.1.1 The first calendar quarter of 2024; or

7.2.5.1.2 The calendar quarter in which the initial PM CEMS correlation test is completed.

7.2.5.2 You must submit the electronic reports within 30 days following the end of each calendar quarter, except for EGUs that have been placed in long-term cold storage (as defined in section 72.2 of this chapter).

7.2.5.3 Each of your electronic quarterly reports shall include the following information:

7.2.5.3.1 The date of report generation;

7.2.5.3.2 Facility identification information;

7.2.5.3.3 The information in sections 7.1.2 through 7.1.7 of this appendix that is applicable to your PM emission measurement methodology; and

7.2.5.3.4 The results of all daily quality assurance assessments, *i.e.,* calibration drift checks and (if applicable) sample volume checks of the PM CEMS, calibration error tests of the other continuous monitoring systems that are used to convert PM concentration to units of the standard, and (if applicable) flow monitor interference checks.

7.2.5.4 Compliance Certification. Based on a reasonable inquiry of those persons with primary responsibility for ensuring that all PM emissions from the affected unit(s) under this subpart have been correctly and fully monitored, the owner or operator must submit a compliance certification in support of each electronic quarterly emissions monitoring report. The compliance certification shall include a statement by a responsible official with that official's name, title, and signature, certifying that, to the best of his or her knowledge, the report is true, accurate, and complete.

■ 19. Subpart UUUUU of part 63 is amended by adding appendix D, to read as follows:

Appendix D to SUBPART UUUUU of Part 63—PM CPMS Monitoring Provisions

1. General Provisions

1.1 *Applicability.* These monitoring provisions apply to the continuous monitoring of the output from a PM CPMS, for the purpose of assessing continuous compliance with an applicable emissions limit in Table 1 or Table 2 to this subpart.

1.2 *Summary of the Method.* The output from an instrument capable of continuously measuring PM concentration is continuously recorded, either in milliamps, PM concentration, or other units of measure. An operating limit for the PM CPMS is established initially, based on data recorded by the monitoring system during a performance stack test. The performance test is repeated annually, and the operating limit is reassessed. In-between successive performance tests, the output from the PM CPMS serves as an indicator of continuous compliance with the applicable emissions limit.

2. Continuous Monitoring of the PM CPMS Output

2.1 *System Design and Performance Criteria.* The PM CPMS must meet the design and performance criteria specified in 40 CFR 63.10010(h)(1)(i) through (iii) and 40 CFR 63.10023(b)(2)(iii) and (iv). In addition, an automated DAHS is required to record the output from the PM CPMS and to generate the quarterly electronic data reports required under section 3.2.4 of this appendix.

2.2 *Installation Requirements.* Install the PM CPMS at an appropriate location in the stack or duct, in accordance with 40 CFR 63.10010(a).

2.3 *Determination of Operating Limits.*

2.3.1 In accordance with 40 CFR 63.10007(a)(3), 40 CFR 63.10011(b), 40 CFR 63.10023(a), and Table 6 to this subpart, you must determine an initial site-specific operating limit for your PM CPMS, using data recorded by the monitoring system during a performance stack test that demonstrates compliance with one of the following emissions limits in Table 1 or Table 2 to this subpart: Filterable PM; total non-Hg HAP metals; total HAP metals including Hg (liquid oil-fired units, only); individual non-Hg HAP metals; or individual HAP metals including Hg (liquid oil-fired units, only).

2.3.2 In accordance with 40 CFR 63.10005(d)(2)(i), you must perform the initial stack test no later than the applicable date in 40 CFR 63.9984(f), and according to 40 CFR 63.10005(d)(2)(iii) and 63.10006(a), the performance test must be repeated annually to document compliance with the emissions limit and to reassess the operating limit.

2.3.3 Calculate the operating limits according to 40 CFR 63.10023(b)(1) for existing units, and 40 CFR 63.10023(b)(2) for new units.

2.4 *Data Reduction and Compliance Assessment.*

2.4.1 Reduce the output from the PM CPMS to hourly averages, in accordance with 40 CFR 63.8(g)(2) and (5).

2.4.2 To determine continuous compliance with the operating limit, you must calculate 30-boiler operating day rolling average values of the output from the PM CPMS, in accordance with 40 CFR 63.10010(h)(3) through (6), 40 CFR 63.10021(c), and Table 7 to this subpart.

2.4.3 In accordance with 40 CFR 63.10005(d)(2)(ii), 40 CFR 63.10022(a)(2), and Table 4 to this subpart, the 30-boiler operating day rolling average PM CPMS output must be maintained at or below the operating limit. However, if exceedances of the operating limit should occur, you must follow the applicable procedures in 40 CFR 63.10021(c)(1) and (2).

3. RECORDKEEPING AND REPORTING.

3.1 *Recordkeeping Provisions.* You must keep the applicable records required under

40 CFR 63.10032(b) and (c) for your PM CPMS. In addition, you must maintain a file of all measurements, data, reports, and other information required by this appendix in a form suitable for inspection, for 5 years from the date of each record, in accordance with 40 CFR 63.10033.

3.1.1 Monitoring Plan Records.

3.1.1.1 You must develop and maintain a site-specific monitoring plan for your PM CPMS, in accordance with 63.10000(d).

3.1.1.2 In addition to the site-specific monitoring plan required under 40 CFR 63.10000(d), you must use the ECMPS Client Tool to prepare and maintain an electronic monitoring plan for your PM CPMS.

3.1.1.2.1 Contents of the Electronic Monitoring Plan. The electronic monitoring plan records must include the unit or stack ID number(s), monitoring location(s), the monitoring methodology used (*i.e.,* PM CPMS), the current operating limit of the PM CPMS (including the units of measure), unique system and component ID numbers, the make, model, and serial number of the PM CPMS, the analytical principle of the monitoring system, and monitor span and range information.

3.1.1.2.2 Electronic Monitoring Plan Updates. If you replace or make a change to a PM CPMS that is used to provide data under this subpart (including a change in the automated DAHS) and the replacement or change affects information reported in the electronic monitoring plan (*e.g.,* changes to the make, model and serial number when a PM CPMS is replaced), you must update the monitoring plan.

3.1.2 Operating Parameter Records. You must record the following information for each operating hour of each affected unit and for each group of units utilizing a common stack. For non-operating hours, record only the items in sections 3.1.2.1 and 3.1.2.2 of this appendix.

3.1.2.1 The date and hour;

3.1.2.2 The unit or stack operating time (rounded up to the nearest fraction of an hour (in equal increments that can range from 1 hundredth to 1 quarter of an hour, at the option of the owner or operator); and

3.1.2.3 If applicable, a flag to indicate that the hour is an exempt startup or shutdown hour.

3.1.3 PM CPMS Output Records. For each affected unit or common stack using a PM CPMS, you must record the following information for each unit or stack operating hour:

3.1.3.1 The date and hour;

3.1.3.2 Monitoring system and component identification codes for the PM CPMS, as provided in the electronic monitoring plan, for each operating hour in which the monitoring system is not out-of-control and a valid value of the output parameter is obtained;

3.1.3.3 The hourly average output from the PM CPMS, for each operating hour in which the monitoring system is not out-of-control and a valid value of the output parameter is obtained, either in milliamps, PM concentration, or other units of measure, as applicable;

3.1.3.4 A special code for each operating hour in which the PM CPMS is out-of-control and a valid value of the output parameter is not obtained; and

3.1.3.5 Percent monitor data availability for the PM CPMS, calculated in the manner established for SO_2, CO_2, O_2 or moisture monitoring systems according to section 75.32 of this chapter.

3.1.4 Records of PM CPMS Audits and Out-of-Control Periods. In accordance with 40 CFR 63.10010(h)(7), you must record, and make available upon request, the results of PM CPMS performance audits, as well as the dates of PM CPMS out-of-control periods and the corrective actions taken to return the system to normal operation.

3.2 *Reporting Requirements.*

3.2.1 General Reporting Provisions. You must comply with the following requirements for reporting PM CPMS data from each affected EGU (or group of EGUs monitored at a common stack) under this subpart:

3.2.1.1 Notifications, in accordance with section 3.2.2 of this appendix;

3.2.1.2 Monitoring plan reporting, in accordance with section 3.2.3 of this appendix;

3.2.1.3 Report submittals, in accordance with sections 3.2.4 and 3.2.5 of this appendix.

3.2.2 Notifications. You must provide notifications for the affected unit (or group of units monitored at a common stack) in accordance with 40 CFR 63.10030.

3.2.3 Monitoring Plan Reporting. For each affected unit (or group of units monitored at a common stack) under this subpart using a PM CPMS you must make monitoring plan submittals as follows:

3.2.3.1 For units using the PM CPMS compliance option prior to January 1, 2024, submit the electronic monitoring plan information in section 3.1.1.2.1 of this appendix prior to or concurrent with the first required electronic quarterly report. For units switching to the PM CPMS methodology on or after January 1, 2024, submit the electronic monitoring plan no later than 21 days prior to the date on which the PM test is performed to establish the initial operating limit.

3.2.3.2 Whenever an update of the electronic monitoring plan is required, as provided in section 3.1.1.2.2 of this appendix, the updated information must be submitted either prior to or concurrent with the relevant quarterly electronic emissions report.

3.2.3.3 All electronic monitoring plan submittals and updates shall be made to the Administrator using the ECMPS Client Tool.

3.2.3.4 In accordance with 40 CFR 63.10000(d), you must submit the site-specific monitoring plan described in section 3.1.1.1 of this appendix to the Administrator, if requested.

3.2.4 Electronic Quarterly Reports.

3.2.4.1 For each affected EGU (or group of EGUs monitored at a common stack) that is subject to the provisions of this appendix, reporting of hourly responses from the PM CPMS will begin either with the first operating hour in the third quarter of 2023 or the first operating hour after completion of the initial stack test that establishes the operating limit, whichever is later. The owner or operator must then use the ECMPS Client Tool to submit electronic quarterly reports to the Administrator, in an XML format specified by the Administrator, starting with a report for the later of:

3.2.4.1.1 The first calendar quarter of 2024; or

3.2.4.1.2 The calendar quarter in which the initial operating limit for the PM CPMS is established.

3.2.4.2 The electronic quarterly reports must be submitted within 30 days following the end of each calendar quarter, except for units that have been placed in long-term cold storage (as defined in section 72.2 of this chapter).

3.2.4.3 Each electronic quarterly report shall include the following information:

3.2.4.3.1 The date of report generation;

3.2.4.3.2 Facility identification information; and

3.2.4.3.3 The information in sections 3.1.2 and 3.1.3 of this appendix.

3.2.4.4 Compliance Certification. Based on a reasonable inquiry of those persons with primary responsibility for ensuring that the output from the PM CPMS has been correctly and fully monitored, the owner or operator shall submit a compliance certification in support of each electronic quarterly report. The compliance certification shall include a statement by a responsible official with that official's name, title, and signature, certifying that, to the best of his or her knowledge, the report is true, accurate, and complete.

3.2.5 Performance Stack Test Results. You must use the ECMPS Client Tool to report the results of all performance stack tests conducted to document compliance with the applicable emissions limit in Table 1 or Table 2 to this subpart, as follows:

3.2.5.1 Report a summary of each test electronically, in XML format, in the relevant quarterly compliance report under 40 CFR 63.10031(g); and

3.2.5.2 Provide a complete stack test report as a PDF file, in accordance with 40 CFR 63.10031(f) or (h), as applicable.

■ 20. Subpart UUUUU of part 63 is amended by adding appendix E, to read as follows:

Appendix E to Subpart UUUUU of Part 63—Data Elements

1.0 You must record the electronic data elements in this appendix that apply to your compliance strategy under this subpart. The applicable data elements in sections 2 through 13 of this appendix must be reported in the quarterly compliance reports required under 40 CFR 63.10031(g), in an XML format prescribed by the Administrator, starting with a report that covers the first quarter of 2024. For stack tests used to demonstrate compliance, RATAs, PM CEMS correlations, RRAs and RCAs that are completed on and after January 1, 2024, the applicable data elements in sections 17 through 30 of this appendix must be reported in an XML format prescribed by the Administrator, and the information in section 31 of this appendix must be reported in as one or more PDF files.

2.0 *MATS Compliance Report Root Data Elements.* You must record the following data elements and include them in each quarterly compliance report:

2.1 Energy Information Administration's Office of Regulatory Information Systems (ORIS) Code;
2.2 Facility Name;
2.3 Facility Registry Identifier;
2.4 Title 40 Part;
2.5 Applicable Subpart;
2.6 Calendar Year;
2.7 Calendar Quarter; and
2.8 Submission Comment (optional)
3.0 *Performance Stack Test Summary.* If you elect to demonstrate compliance using periodic performance stack testing (including 30-boiler operating day Hg LEE tests), record the following data elements for each test:
3.1 Parameter
3.2 Test Location ID;
3.3 Test Number;
3.4 Test Begin Date, Hour, and Minute;
3.5 Test End Date, Hour, and Minute;
3.6 Timing of Test (either performed on-schedule according to 40 CFR 63.10006(f), or was late);
3.7 Averaging Plan Indicator;
3.8 Averaging Group ID (if applicable);
3.9 EPA Test Method Code;
3.10 Emission Limit, Including Units of Measure;
3.11 Average Pollutant Emission Rate;
3.12 LEE Indicator;
3.13 LEE Basis (if applicable); and
3.14 Submission Comment (optional)
4.0 *Operating limit Data (PM CPMS, only):*
4.1 Parameter Type;
4.2 Operating Limit; and
4.3 Units of Measure.
5.0 *Performance Test Run Data.* For each run of the performance stack test, record the following data elements:
5.1 Run Number
5.2 Run Begin Date, Hour, and Minute;
5.3 Run End Date, Hour, and Minute;
5.4 Pollutant Concentration and Units of Measure;
5.5 Emission Rate;
5.6 EPA Test Method 19 Equation (if applicable);
5.7 Total Sampling Time; and
5.8 Total Sample Volume.
6.0 *Conversion Parameters.* For the parameters that are used to convert the pollutant concentration to units of the emission standard (including, as applicable, CO_2 or O_2 concentration, stack gas flow rate, stack gas moisture content, F-factors, and gross output), record:
6.1 Parameter Type;
6.2 Parameter Source; and
6.3 Parameter Value, Including Units of Measure.
7.0 *Quality Assurance Parameters:* For key parameters that are used to quality-assure the reference method data (including, as applicable, filter temperature, percent isokinetic, leak check results, percent breakthrough, percent spike recovery, and relative deviation), record:
7.1 Parameter Type;
7.2 Parameter Value; and
7.3 Pass/Fail Status.
8.0 *Averaging Group Configuration.* If a particular EGU or common stack is included in an averaging plan, record the following data elements:
8.1 Parameter Being Averaged;
8.2 Averaging Group ID; and
8.3 Unit or Common Stack ID.
9.0 *Compliance Averages.* If you elect to (or are required to) demonstrate compliance using continuous monitoring system(s) on a 30-boiler operating day rolling average basis (or on a 30- or 90-group boiler operating day rolling WAER basis, if your monitored EGU or common stack is in an averaging plan), you must record the following data elements for each average emission rate (or, for units in an averaging plan, for each WAER):
9.1 Unit or Common Stack ID;
9.2 Averaging Group ID (if applicable);
9.3 Parameter Being Averaged;
9.4 Date;
9.5 Average Type;
9.6 Units of Measure; and
9.7 Average Value.
9.8 Comment Field.
10.0 *Unit Information.* You must record the following data elements for each EGU:
10.1 Unit ID;
10.2 Date of Last Tune-up; and
10.3 Emergency Bypass Information. If your coal-fired EGU, solid oil-derived fuel-fired EGU, or IGCC is equipped with a main stack and a bypass stack (or bypass duct) configuration, and has qualified to use the LEE compliance option, you must report the following emergency bypass information annually, in the compliance report for the fourth calendar quarter of the year:
10.3.1 The number of emergency bypass hours for the year, as a percentage of the EGU's annual operating hours;
10.3.2 A description of each emergency bypass event during the year, including the cause and corrective actions taken;
10.3.3 An explanation of how clean fuels were burned to the maximum extent possible during each emergency bypass event;
10.3.4 An estimate of the emissions released during each emergency bypass event. You must also show whether LEE status has been retained or lost, based on the emissions estimate and the results of the previous LEE retest; and
10.3.5 If there were no emergency bypass events during the year, a statement to that effect.
11.0 *Fuel Usage Information.* If subject to an emissions limit, record the following monthly fuel usage information:
11.1 Calendar Month;
11.2 Each Type of Fuel Used During the Calendar Month in the Quarter;
11.3 Quantity of Each Type of Fuel Combusted in Each Calendar Month in the Quarter, with Units of Measure;
11.4 New Fuel Type Indicator (if applicable); and
11.5 Date of Performance Test Using the New Fuel (if applicable.
12.0 *Malfunction Information (if applicable):* If there was a malfunction of the process equipment or control equipment during the reporting period that caused (or may have caused) an exceedance of an emissions or operating limit, record:
12.1 Event Begin Date and Hour (if known);
12.2 Event End Date and Hour;
12.3 Malfunction Description; and
12.4 Corrective Action.
13.0 *Deviations and Monitoring Downtime.* If there were any deviations or monitoring downtime during the reporting period, record:
13.1 Unit, Common Stack, or Averaging Group ID;
13.2 The nature of the deviation, as either:
13.2.1 Emission limit exceeded;
13.2.2 Operating limit exceeded;
13.2.3 Work practice standard not met;
13.2.4 Testing requirement not met;
13.2.5 Monitoring requirement not met;
13.2.6 Monitoring downtime incurred; or
13.2.7 Other requirement not met.
13.3 A description of the deviation, or monitoring downtime, as follows:
13.3.1 For a performance stack test or a 30- (or 90-) boiler operating day rolling average that exceeds an emissions or operating limit, record the parameter (*e.g.,* HCl, Hg, PM), the limit that was exceeded, and either the date of the non-complying performance test or the beginning and ending dates of the non-complying rolling average;
13.3.2 If an unmonitored bypass stack was used during the reporting period, record the total number of hours of bypass stack usage;
13.3.3 For periods where valid monitoring data are not reported during the reporting period, record the monitored parameter, the total source operating time (hours), and the total number of hours of monitoring deviation or downtime and other information, as indicated, for:
13.3.3.1 Monitoring system malfunctions/repairs (deviation and downtime);
13.3.3.2 Out-of-control periods/repairs (deviation and downtime);
13.3.3.3 Non-monitoring equipment malfunctions (downtime);
13.3.3.4 QA/QC activities (excluding zero and span checks) (downtime);
13.3.3.5 Routine maintenance (downtime);
13.3.3.6 Other known causes (downtime); and
13.3.3.7 Unknown causes (downtime).
13.3.4 If a performance stack test was due within the quarter but was not done, record the parameter (*e.g.,* HCl, PM), the test deadline, and a statement that the test was not done as required;
13.3.5 For a late performance stack test conducted during the quarter, record the parameter, the test deadline, and the number of days that elapsed between the test deadline and the test completion date.
13.4 Record any corrective actions taken in response to the deviation.
13.5 If there were no deviations and/or no monitoring downtime during the quarter, record a statement to that effect.
14.0 *Reference Method Data Elements.* For each of the following tests that is completed on and after January 1, 2024, you must record and report the applicable electronic data elements in sections 17 through 29 of this appendix, pertaining to the reference method(s) used for the test (see section 16 of this appendix).
14.1 Each quarterly, annual, or triennial stack test used to demonstrate compliance (including 30- (or 90-) boiler operating day Hg LEE tests and PM tests used to set operating limits for PM CPMS);

14.2 Each RATA of your Hg, HCl, HF, or SO_2 CEMS or each RATA of your Hg sorbent trap monitoring system; and

14.3 Each correlation test, RRA and each RCA of your PM CEMS.

15.0 You must report the applicable data elements for each test described in section 14 of this appendix in an XML format prescribed by the Administrator.

15.1 For each stack test completed during a particular calendar quarter and contained in the quarterly compliance report, you must submit along with the quarterly compliance report, the data elements in sections 17 and 18 of this appendix (which are common to all tests) and the applicable data elements in sections 19 through 31 of this appendix associated with the reference method(s) used.

15.2 For each RATA, PM CEMS correlation, RRA, or RCA, when you use the ECMPS Client Tool to report the test results as required under appendix A, B, or C to this subpart or, for SO_2 RATAs under part 75 of this chapter, you must submit along with the test results, the data elements in sections 17 and 18 of this appendix and, for each test run, the data elements in sections 19 through 30 of this appendix that are associated with the reference method(s) used.

15.3 For each stack test, RATA, PM CEMS correlation, RRA, and RCA, you must also provide the information described in section 31 of this appendix as a PDF file, either along with the quarterly compliance report (for stack tests) or together with the test results reported under appendix A, B, or C to this subpart or part 75 of this chapter (for RATAs, RRAs, RCAs, or PM CEMS correlations).

16.0 *Applicable Reference Methods.* One or more of the following EPA reference methods is needed for the tests described in sections 14.1 through 14.3 of this appendix: Method 1, 2, 3A, 4, 5, 5D, 6C, 26, 26A, 29, and/or 30B.

16.1 Application of EPA test Methods 1 and 2. If you use periodic stack testing to comply with an *output-based* emissions limit, you must determine the stack gas flow rate during each performance test run in which EPA test Method 5, 5D, 26, 26A, 29, or 30B is used, in order to convert the measured pollutant concentration to units of the standard. For EPA test Methods 5, 5D, 26A and 29, which require isokinetic sampling, the delta-P readings made with the pitot tube and manometer at the EPA test Method 1 traverse points, taken together with measurements of stack gas temperature, pressure, diluent gas concentration (from a separate EPA test Method 3A or 3B test) and moisture, provide the necessary data for the EPA test Method 2 flow rate calculations. Note that even if you elect to comply with a *heat input-based* standard, when EPA test Method 5, 5D, 26A, or 29 is used, you must still use EPA test Method 2 to determine the average stack gas velocity (v_s), which is needed for the percent isokinetic calculation. The EPA test Methods 26 and 30B do not require isokinetic sampling; therefore, when either of these methods is used, if the stack gas flow rate is needed to comply with the applicable *output-based* emissions limit, you must make a separate EPA test Method 2 determination during each test run.

16.2 Application of EPA test Method 3A. If you elect to perform periodic stack testing to comply with a *heat input-based* emissions limit, a separate measurement of the diluent gas (CO_2 or O_2) concentration is required for each test run in which EPA test Method 5, 5D, 26, 26A, 29, or 30B is used, in order to convert the measured pollutant concentration to units of the standard. The EPA test Method 3A is the preferred CO_2 or O_2 test method, although EPA test Method 3B may be used instead. Diluent gas measurements are also needed for stack gas molecular weight determinations when using EPA test Method 2.

16.3 Application of EPA test Method 4. For performance stack tests, depending on which equation is used to convert pollutant concentration to units of the standard, measurement of the stack gas moisture content, using EPA test Method 4, may also be required for each test run. The EPA test Method 4 moisture data are also needed for the EPA test Method 2 calculations (to determine the molecular weight of the gas) and for the RATA of an Hg CEMS that measures on a wet basis, when EPA test Method 30B is used. Other applications that require EPA test Method 4 moisture determinations include: RATAs of an SO_2 monitor, when the reference method and CEMS data are measured on a different moisture basis (wet or dry); conversion of wet-basis pollutant concentrations to the units of a *heat input-based* emissions limit when certain EPA test Method 19 equations are used (*e.g.,* Eq. 19–3, 19–4, or 19–8); and stack gas molecular weight determinations. When EPA test Method 5, 5D, 26A, or 29 is used for the performance test, the EPA test Method 4 moisture determination may be made by using the water collected in the impingers together with data from the dry gas meter; alternatively, a separate EPA test Method 4 determination may be made. However, when EPA test Method 26 or 30B is used, EPA test Method 4 must be performed separately.

16.4 Applications of EPA test Methods 5 and 5D. The EPA test Method 5 (or, if applicable 5D) must be used for the following applications: To demonstrate compliance with a filterable PM emissions limit; for PM tests used to set operating limits for PM CPMS; and for the initial correlations, RRAs and RCAs of a PM CEMS.

16.5 Applications of EPA test Method 6C. If you elect to monitor SO_2 emissions from your coal-fired EGU as a surrogate for HCl, the SO_2 CEMS must be installed, certified, operated, and maintained according to 40 CFR part 75. Part 75 allows the use of EPA test Methods 6, 6A, 6B, and 6C for the required RATAs of the SO_2 monitor. However, in practice, only instrumental EPA test Method 6C is used.

16.6 Applications of EPA test Methods 26 and 26A. The EPA test Method 26A may be used for quarterly HCl or HF stack testing, or for the RATA of an HCl or HF CEMS. The EPA test Method 26 may be used for quarterly HCl or HF stack testing; however, for the RATAs of an HCl monitor that is following PS 18 and Procedure 6 in appendices B and F to part 60 of this chapter, EPA test Method 26 may only be used if approved upon request.

16.7 Applications of EPA test Method 29. The EPA test Method 29 may be used for periodic performance stack tests to determine compliance with individual or total HAP metals emissions limits. For coal-fired EGUs, the total HAP emissions limits exclude Hg.

16.8 Applications of EPA test Method 30B. The EPA test Method 30B is used for 30- (or 90-) boiler operating day Hg LEE tests and RATAs of Hg CEMS and sorbent trap monitoring systems, and it may be used for quarterly Hg stack testing (oil-fired EGUs, only).

17.0 *Facility and Test Company Information.* In accordance with 40 CFR 63.7(e)(3), a test is defined as three or more runs of one or more EPA Reference Method(s) conducted to measure the amount of a specific regulated pollutant, pollutants, or surrogates being emitted from a particular EGU (or group of EGUs that share a common stack), and to satisfy requirements of this subpart. On or after January 1, 2024, you must report the data elements in sections 17 and 18, each time that you complete a required performance stack test, RATA, PM CEMS correlation, RRA, or RCA at the affected EGU(s), using EPA test Method 5, 5B, 5D, 6C, 26, 26A, 29, or 30B. You must also report the applicable data elements in sections 19 through 25 of this appendix for each test. If any separate, corresponding EPA test Method 2, 3A, or 4 test is conducted in order to convert a pollutant concentration to the units of the applicable emission standard given in Table 1 or Table 2 of this subpart or to convert pollutant concentration from wet to dry basis (or vice-versa), you must also report the applicable data elements in sections 26 through 31 of this appendix.

The applicable data elements in sections 17 through 31 of this appendix must be submitted separately, in XML format, along with the quarterly Compliance Report (for stack tests) or along with the electronic test results submitted to the ECMPS Client Tool (for CMS performance evaluations). The Electronic Reporting Tool (ERT) or an equivalent schema can be utilized to create this XML file. *Note:* Ideally, for all of the tests completed at a given facility in a particular calendar quarter, the applicable data elements in sections 17 through 31 of this appendix should be submitted together in one XML file. However, as shown in Table 8 to this subpart, the timelines for submitting stack test results and CMS performance evaluations are not identical. Therefore, for calendar quarters in which both types of tests are completed, it may not be possible to submit the applicable data elements for all of those tests in a single XML file; separate submittals may be necessary to meet the applicable reporting deadlines.

17.1 Part;
17.2 Subpart;
17.3 ORIS Code;
17.4 Facility Name;
17.5 Facility Address;
17.6 Facility City;
17.7 Facility County;
17.8 Facility State;
17.9 Facility Zip Code;
17.10 Facility Point of Contact;
17.11 Facility Contact Phone Number;
17.12 Facility Contact Email;

17.13 EPA Facility Registration System Number;
17.14 Source Classification Code;
17.15 State Facility ID;
17.16 Project Number;
17.17 Name of Test Company;
17.18 Test Company Address;
17.19 Test Company City;
17.20 Test Company State;
17.21 Test Company Zip Code;
17.22 Test Company Point of Contact;
17.23 Test Company Contact Phone Number;
17.24 Test Company Contact Email; and
17.25 Test Comment (optional, PM CPMS operating limits, if applicable).

18.0 *Source Information Data Elements.* You must report the following data elements, as applicable, for each source for which at least one test is included in the XML file:
18.1 Source ID (sampling location);
18.2 Stack (duct) Diameter (circular stack) (in.);
18.3 Equivalent Diameter (rectangular duct or stack) (in.);
18.4 Area of Stack;
18.5 Control Device Code; and
18.6 Control Device Description.

19.0 *Run-Level and Lab Data Elements for EPA test Methods 5, 5B, 5D, 26A, and 29.* You must report the appropriate Source ID (*i.e.,* Data Element 18.1) and the following data elements, as applicable, for each run of each performance stack test, PM CEMS correlation test, RATA, RRA, or RCA conducted using isokinetic EPA test Method 5, 5B, 5D, or 26A. If your EGU is oil-fired and you use EPA test Method 26A to conduct stack tests for both HCl and HF, you must report these data elements separately for each pollutant. When you use EPA test Method 29 to measure the individual HAP metals, total filterable HAP metals and total HAP metals, report only the run-level data elements (19.1, 19.3 through 19.30, and 19.38 through 19.41), and the point-level and lab data elements in sections 20 and 21 of this appendix:
19.1 Test Number;
19.2 Pollutant Name;
19.3 EPA Test Method;
19.4 Run Number;
19.5 Corresponding Reference Method(s), if applicable;
19.6 Corresponding Reference Method(s) Run Number, if applicable;
19.7 Number of Traverse Points;
19.8 Run Begin Date;
19.9 Run Start Time (clock time start);
19.10 Run End Date;
19.11 Run End Time (clock time end);
19.12 Barometric Pressure;
19.13 Static Pressure;
19.14 Cumulative Elapsed Sampling Time;
19.15 Percent O_2;
19.16 Percent CO_2;
19.17 Pitot Tube ID;
19.18 Pitot Tube Calibration Coefficient;
19.19 Nozzle Calibration Diameter;
19.20 F-Factor (F_d, F_w, or F_c);
19.21 Calibration Coefficient of Dry Gas Meter (Y);
19.22 Total Volume of Liquid Collected in Impingers and Silica Gel;
19.23 Percent Moisture—Actual;
19.24 Dry Molecular Weight of Stack Gas;
19.25 Wet Molecular Weight of Stack Gas;
19.26 Initial Reading of Dry Gas Meter Volume (dcf);
19.27 Final Reading of Dry Gas Meter Volume (dcf);
19.28 Stack Gas Velocity—fps;
19.29 Stack Gas Flow Rate—dscfm;
19.30 Type of Fuel;
19.31 Pollutant Mass Collected (value);
19.32 Pollutant Mass Unit of Measure;
19.33 Detection Limit Flag;
19.34 Pollutant Concentration;
19.35 Pollutant Concentration Unit of Measure;
19.36 Pollutant Emission Rate;
19.37 Pollutant Emission Rate Units of Measure (in units of the standard);
19.38 Compliance Limit Basis (heat input or electrical output);
19.39 Heat Input or Electrical Output Unit of Measure;
19.40 Process Parameter (value);
19.41 Process Parameter Unit of Measure;
19.42 Converted Concentration for PM CEMS only; and
19.43 Converted Concentration Units (units of correlation for PM CEMS).

20.0 *Point-Level Data Elements for EPA test Methods 5, 5B, 5D, 26A, & 29.* To link the point-level data with the run data in the xml schema, you must report the Source ID (*i.e.,* Data Element 18.1), EPA Test Method (Data Element 19.3), Run Number (Data Element 19.4), and Run Begin Date (Data Element 19.8) with the following point-level data elements for each run of each performance stack test, PM CEMS correlation test, RATA, RRA, or RCA conducted using isokinetic EPA test Method 5, 5B, 5D, 26A, or 29. Note that these data elements are required for all EPA test Method 29 applications, whether the method is being used to measure the total or individual HAP metals concentrations:
20.1 Traverse Point ID;
20.2 Stack Temperature;
20.3 Differential Pressure Reading (ΔP);
20.4 Orifice Pressure Reading (ΔH);
20.5 Dry Gas Meter Inlet Temperature;
20.6 Dry Gas Meter Outlet Temperature; and
20.7 Filter Temperature.

21.0 *Laboratory Results for EPA test Methods 29 Total or Individual Multiple HAP Metals.* If you use EPA test Method 29 and elect to comply with the total or individual HAP metals standards, you must report run-level data elements 19.1 through 19.34 in Section 19, and the point-level data elements in Section 20. To link the laboratory data with the run data in the xml schema, you must report the Source ID (*i.e.,* Data Element 18.1), EPA Test Method (Data Element 19.3), Run Number (Data Element 19.4), and Run Begin Date (Data Element 19.8) with the results of the laboratory analyses. Regardless of whether you elect to comply with the total HAP metals standard or the individual HAP metals standard, you must report the front half catch, the back half catch, and the sum of the front and back half catches collected with EPA test Method 29 for each individual HAP metal and for the total HAP metals. The list of individual HAP metals is Antimony, Arsenic, Beryllium, Cadmium, Chromium, Cobalt, Lead, Manganese, Nickel, Selenium, and Mercury (if applicable). You must also calculate and report the pollutant emission rates(s) in relation to the standard(s) with which you have elected to comply and the units specified in Table 5 as follows:
21.1 Each Individual HAP metal total mass collected:
21.1.1 Pollutant Name;
21.1.2 Pollutant Mass Collected;
21.1.3 Pollutant Mass Units of Measure; and
21.1.4 Detection Limit Flag.
21.2 Each Individual HAP metal Front Half:
21.2.1 Pollutant Name;
21.2.2 Pollutant Mass Collected;
21.2.3 Pollutant Mass Units of Measure; and
21.2.4 Detection Limit Flag.
21.3 Each Individual HAP metal Back Half:
21.3.1 Pollutant Name;
21.3.2 Pollutant Mass Collected;
21.3.3 Pollutant Mass Units of Measure; and
21.3.4 Detection Limit Flag.
21.4 Each Individual HAP metal concentration:
21.4.1 Pollutant Name;
21.4.2 Pollutant Concentration; and
21.4.3 Pollutant Concentration Units of Measure.
21.5 Each Individual HAP metal emission rate in units of the standard:
21.5.1 Pollutant Name;
21.5.2 Pollutant Emission Rate; and
21.5.3 Pollutant Emission Rate Units of Measure.
21.6 Each Individual HAP metal emission rate in units of lbs/MMBTU or lbs/MW (per Table 5):
21.6.1 Pollutant Name;
21.6.2 Pollutant Emission Rate; and
21.6.3 Pollutant Emission Rate Units of Measure.
21.7 Total Filterable HAP metals mass collected:
21.7.1 Pollutant Name;
21.7.2 Pollutant Mass Collected;
21.7.3 Pollutant Mass Units of Measure; and
21.7.4 Detection Limit Flag.
21.8 Total Filterable HAP metals concentration:
21.8.1 Pollutant Name;
21.8.2 Pollutant Concentration; and
21.8.3 Pollutant Concentration Units of Measure.
21.9 Total Filterable HAP metals in units of lbs/MMBtu or lbs/MW (per Table 5):
21.9.1 Pollutant Name;
21.9.2 Pollutant Emission Rate; and
21.9.3 Pollutant Emission Rate Units of Measure.
21.10 Total HAP metals mass collected:
21.10.1 Pollutant Name;
21.10.2 Pollutant Mass Collected;
21.10.3 Pollutant Mass Units of Measure; and
21.10.4 Detection Limit Flag.
21.11 Total HAP metals concentration
21.11.1 Pollutant Name;
21.11.2 Pollutant Concentration; and
21.11.3 Pollutant Concentration Units of Measure.
21.12 Total HAP metals Emission Rate in Units of the Standard:

21.12.1 Pollutant Name;
21.12.2 Pollutant Emission Rate; and
21.12.3 Pollutant Emission Rate Units of Measure.
21.13 Total HAP metals Emission Rate in lbs/MMBtu or lbs/MW (per Table 5):
21.13.1 Pollutant Name;
21.13.2 Pollutant Emission Rate; and
21.13.3 Pollutant Emission Rate Units of Measure.
22.0 *Run-Level and Lab Data Elements for EPA test Method 26.* If you use EPA test Method 26, you must report the Source ID (*i.e.,* Data Element 18.1) and the following run-level data elements for each test run. If your EGU is oil-fired and you use EPA test Method 26 to conduct stack tests for both HCl and HF, you must report these data elements separately for each pollutant:
22.1 Test Number;
22.2 Pollutant Name;
22.3 EPA Test Method;
22.4 Run Number;
22.5 Corresponding Reference Method(s), if applicable;
22.6 Corresponding Reference Method(s) Run Number, if applicable;
22.7 Number of Traverse Points;
22.8 Run Begin Date;
22.9 Run Start Time (clock start time);
22.10 Run End Date;
22.11 Run End Time (clock end time);
22.12 Barometric Pressure;
22.13 Cumulative Elapsed Sampling Time;
22.14 Calibration Coefficient of Dry Gas Meter (Y);
22.15 Initial Reading of Dry Gas Meter Volume (dcf);
22.16 Final Reading of Dry Gas Meter Volume (dcf);
22.17 Percent O_2;
22.18 Percent CO_2;
22.19 Type of Fuel;
22.20 F-Factor (F_d, F_w, or F_c);
22.21 Pollutant Mass Collected (value);
22.22 Pollutant Mass Units of Measure;
22.23 Detection Limit Flag;
22.24 Pollutant Concentration;
22.25 Pollutant Concentration Unit of Measure;
22.26 Compliance Limit Basis (heat input or electrical output);
22.27 Heat Input or Electrical Output Unit of Measure;
22.28 Process Parameter (value);
22.29 Process Parameter Unit of Measure;
22.30 Pollutant Emission Rate; and
22.31 Pollutant Emission Rate Units of Measure (in the units of the standard).
23.0 *Point-Level Data Elements for EPA test Method 26.* To link the point-level data in this section with the run-level data in the XML schema, you must report the Source ID (*i.e.,* Data Element 18.1), EPA Test Method (Data Element 22.3), Run Number (Data Element 22.4), and Run Begin Date (Data Element 22.8) from section 22 and the following point-level data elements for each run of each EPA test Method 26 test:
23.1 Traverse Point ID;
23.2 Filter Temperature; and
23.3 Dry Gas Meter Temperature.
24.0 *Run-Level Data for EPA test Method 30B.* You must report Source ID (*i.e.* Data Element 18.1) and the following run-level data elements for each EPA test Method 30B test run:
24.1 Test Number;
24.2 Pollutant Name;
24.3 EPA Test Method;
24.4 Run Number;
24.5 Corresponding Reference Method(s), if applicable;
24.6 Corresponding Reference Method(s) Run Number, if applicable;
24.7 Number of Traverse Points;
24.8 Run Begin Date;
24.9 Run Start Time (clock time start);
24.10 Run End Date;
24.11 Run End Time (clock time end);
24.12 Barometric Pressure;
24.13 Percent O_2;
24.14 Percent CO_2;
24.15 Cumulative Elapsed Sampling Time;
24.16 Calibration Coefficient of Dry Gas Meter Box A (Y);
24.17 Initial Reading of Dry Gas Meter Volume (A);
24.18 Final Reading of Dry Gas Meter Volume (A);
24.19 Calibration Coefficient of Dry Gas Meter Box B (Y);
24.20 Initial Reading of Dry Gas Meter Volume (B);
24.21 Final Reading of Dry Gas Meter Volume (B);
24.22 Gas Sample Volume Units of Measure;
24.23 Post-Run Leak Rate (A);
24.24 Post-Run Leak Check Vacuum (A);
24.25 Post-Run Leak Rate (B);
24.26 Post-Run Leak Check Vacuum (B);
24.27 Sorbent Trap ID (A);
24.28 Pollutant Mass Collected, Section 1 (A);
24.29 Pollutant Mass Collected, Section 2 (A);
24.30 Mass of Spike on Sorbent Trap A;
24.31 Total Pollutant Mass Trap A;
24.32 Sorbent Trap ID (B);
24.33 Pollutant Mass Collected, Section 1 (B);
24.34 Pollutant Mass Collected, Section 2 (B);
24.35 Mass of Spike on Sorbent Trap B;
24.36 Total Pollutant Mass Trap B;
24.37 Pollutant Mass Units of Measure;
24.38 Pollutant Average Concentration;
24.39 Pollutant Concentration Units of Measure;
24.40 Method Detection Limit;
24.41 Percent Spike Recovery;
24.42 Type of Fuel;
24.43 F-Factor (F_d, F_w, or F_c);
24.44 Compliance Limit Basis (heat input or electrical output);
24.45 Heat Input or Electrical Output Unit of Measure;
24.46 Process Parameter (value);
24.47 Process Parameter Unit of Measure;
24.48 Pollutant Emission Rate; and
24.49 Pollutant Emission Rate Unit of Measure (in the units of the standard).
25.0 *Point-Level Data Elements for EPA test Method 30B.* You must report the Source ID (*i.e.,* Data Element 18.1), EPA Test Method (Data Element 24.3), Run Number (Data Element 24.4), and Run Begin Date (Data Element 24.8) and the following point-level data elements for each run of each EPA test Method 30B test:
25.1 Traverse Point ID;
25.2 Dry Gas Meter Temperature (A);
25.3 Sample Flow Rate (A) (L/min);
25.4 Dry Gas Meter Temperature (B); and
25.5 Sample Flow Rate (B) (L/min).
26.0 *Pre-Run Data Elements for EPA test Methods 3A and 6C.* You must report the Source ID (*i.e.,* Data Element 18.1) and the following pre-run data elements for each SO_2 RATA using instrumental EPA test Method 6C, and for each instrumental EPA test Method 3A O_2 or CO_2 test that is performed to convert a pollutant concentration to the units of measure of the applicable emission unit of standard in Table 1 or 2 of this subpart:
26.1 Test Number;
26.2 EPA Test Method;
26.3 Calibration Gas Cylinder Analyte;
26.4 Cylinder Gas Units of Measure;
26.5 Date of Calibration;
26.6 Calibration Low-Level Gas Cylinder ID;
26.7 Calibration Low-Level Gas Concentration;
26.8 Calibration Low-Level Cylinder Expiration Date;
26.9 Calibration Mid-Level Gas Cylinder ID;
26.10 Calibration Mid-Level Gas Concentration;
26.11 Calibration Mid-Level Cylinder Expiration Date;
26.12 Calibration High-Level Gas Cylinder ID;
26.13 Calibration Span (High-Level) Gas Concentration;
26.14 Calibration High-Level Cylinder Expiration Date;
26.15 Low-Level Gas Response;
26.16 Low-Level Calibration Error;
26.17 Low-Level Alternate Performance Specification (APS) Flag;
26.18 Mid-Level Gas Response;
26.19 Mid-Level Calibration Error;
26.20 Mid-Level APS Flag;
26.21 High-Level Gas Response;
26.22 High-Level Calibration Error; and
26.23 High-Level APS Flag.
27.0 *Run-Level Data Elements for EPA test Methods 3A and 6C.* You must report the Source ID (*i.e.,* Data Element 18.1) and following run-level data elements for each run of each SO_2 RATA using instrumental EPA test Method 6C, and for each run of each corresponding instrumental EPA test Method 3A test that is performed to convert a pollutant concentration to the applicable emission unit of standard in Table 1 or 2 of this subpart:
27.1 Test Number;
27.2 Pollutant or Analyte Name;
27.3 EPA Test Method;
27.4 Run Number;
27.5 Corresponding Reference Method(s), if applicable;
27.6 Corresponding Reference Method(s) Run Number(s), if applicable;
27.7 Number of Traverse Points;
27.8 Run Begin Date;
27.9 Run Start Time (clock time start);
27.10 Run End Date;
27.11 Run End Time (clock time end);
27.12 Cumulative Elapsed Sampling Time;
27.13 Upscale (mid or high) Gas Level;

27.14 Pre-Run Low-Level Response;
27.15 Pre-Run Low-Level System Bias;
27.16 Pre-Run Low-Level Bias APS Flag;
27.17 Pre-Run Upscale (mid or high) Response;
27.18 Pre-Run Upscale (mid or high) System Bias;
27.19 Pre-Run Upscale (mid or high) Bias APS Flag;
27.20 Post-Run Low-Level Response;
27.21 Post-Run Low-Level System Bias;
27.22 Post-Run Low-Level Bias APS Flag;
27.23 Post-Run Low-Level Drift;
27.24 Post-Run Low-Level Drift APS Flag;
27.25 Post-Run Upscale (mid or high) Response;
27.26 Post-Run Upscale (mid or high) System Bias;
27.27 Post-Run Upscale (mid or high) System Bias APS Flag;
27.28 Post-Run Upscale (mid or high) Drift;
27.29 Post-Run Upscale (mid or high) Drift APS Flag;
27.30 Unadjusted Raw Emissions Average Concentration;
27.31 Calculated Average Concentration, Adjusted for Bias (C_{gas});
27.32 Concentration Units of Measure (Dry or wet);
27.33 Type of Fuel;
27.34 Process Parameter (value); and
27.35 Process Parameter Units of Measure.

28.0 *Run-Level Data Elements for EPA test Method 2.* When you make a separate determination of the stack gas flow rate using EPA test Method 2 separately, corresponding to a pollutant reference method test, *i.e.,* when data from the pollutant reference method cannot determine the stack gas flow rate, you must report the Source ID (*i.e.,* Data Element 18.1) and following run-level data elements for each EPA test Method 2 test run:
28.1 Test Number;
28.2 EPA Test Method;
28.3 Run Number;
28.4 Number of Traverse Points;
28.5 Run Begin Date;
28.6 Run Start Time (clock time start);
28.7 Run End Date;
28.8 Run End Time (clock time end);
28.9 Pitot Tube ID;
28.10 Pitot Tube Calibration Coefficient;
28.11 Barometric Pressure;
28.12 Static Pressure;
28.13 Percent O_2;
28.14 Percent CO_2;
28.15 Percent Moisture—actual;
28.16 Dry Molecular Weight of Stack Gas;
28.17 Wet Molecular Weight of Stack Gas;
28.18 Stack Gas Velocity—fps; and
28.19 Stack Gas Flow Rate—dscfm.

29.0 *Point-Level Data Elements for EPA test Method 2.* For each run of each separate EPA test Method 2 test, you must report the Source ID (*i.e.,* Data Element 18.1), EPA Test Method (Data Element 28.2), Run Number (Data Element 28.3), and Run Begin Date (Data Element 28.5) and the following point-level data elements:
29.1 Traverse Point ID;
29.2 Stack Temperature; and
29.3 Differential Pressure Reading (ΔP).

30.0 *Run-Level Data Elements for EPA test Method 4.* When you make a separate EPA test Method 4 determination of the stack gas moisture content corresponding to a pollutant reference method test, *i.e.,* when data from the pollutant reference method cannot determine the moisture content, you must report the Source ID (*i.e.,* Data Element 18.1) and the following run-level data elements for each EPA test Method 4 test run:
30.1 Test Number;
30.2 EPA Test Method;
30.3 Run Number;
30.4 Number of Traverse Points;
30.5 Run Begin Date;
30.6 Run Start Time (clock time start);
30.7 Run End Date;
30.8 Run End Time (clock time end);
30.9 Barometric Pressure;
30.10 Calibration Coefficient of Dry Gas Meter (Y);
30.11 Volume of Water Collected in Impingers and Silica Gel;
30.12 Percent Moisture-actual;
30.13 Initial Reading of Dry Gas Meter Volume (dcf);
30.14 Final Reading of Dry Gas Meter Volume (dcf); and
30.15 Dry Gas Meter Temperature (average).

31.0 *Other Information for Each Test or Test Series.* You must provide each test included in the XML data file described in this appendix with supporting documentation, in a PDF file submitted concurrently with the XML file, such that all the data required to be reported by 40 CFR 63.7(g) are provided. That supporting data include but are not limited to diagrams showing the location of the test site and the sampling points, laboratory report(s) including analytical calibrations, calibrations of source sampling equipment, calibration gas cylinder certificates, raw instrumental data, field data sheets, quality assurance data (*e.g.* field recovery spikes) and any required audit results and stack testers' credentials (if applicable). The applicable data elements in 40 CFR 63.10031(f)(6)(i) through (xii) of this section must be entered into ECMPS with each PDF submittal; the test number(s) (see 40 CFR 63.10031(f)(6)(xi)) must be included. The test number(s) must match the test number(s) in sections 19 through 31 of this appendix (as applicable).

National Emission Standards for Hazardous Air Pollutants: Miscellaneous Coating Manufacturing Residual Risk and Technology Review

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: The U.S. Environmental Protection Agency (EPA) is taking final action on the residual risk and technology review (RTR) conducted for the Miscellaneous Coating Manufacturing (MCM) source category regulated under national emission standards for hazardous air pollutants (NESHAP). These final amendments also address emissions during periods of startup, shutdown, and malfunction (SSM), including clarifying regulatory provisions for certain vent control bypasses, provisions for electronic reporting of performance test results, performance evaluation reports, compliance reports, and Notification of Compliance Status (NOCS) reports; and provisions to conduct periodic performance testing of oxidizers used to reduce emissions of organic hazardous air pollutants (HAP).

DATES: This final rule is effective on August 14, 2020. The incorporation by reference (IBR) of certain publications listed in the rule is approved by the Director of the Federal Register as of August 14, 2020.

ADDRESSES: The EPA has established a docket for this action under Docket ID No. EPA–HQ–OAR–2018–0747. All documents in the docket are listed on the *https://www.regulations.gov/* website. Although listed, some information is not publicly available, *e.g.,* Confidential Business Information or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the internet and will be publicly available only in hard copy form. Publicly available docket materials are available electronically through *https://www.regulations.gov/.* Out of an abundance of caution for members of the public and our staff, the EPA Docket Center and Reading Room was closed to public visitors on March 31, 2020, to reduce the risk of transmitting COVID–19. Our Docket Center staff will continue to provide remote customer service via email, phone, and webform. There is a temporary suspension of mail delivery to the EPA, and no hand deliveries will be accepted. For further information on EPA Docket Center services and the current status, please visit us online at *https://www.epa.gov/dockets.*

FOR FURTHER INFORMATION CONTACT: For questions about this final action, contact Ms. Angela Carey, Sector Policies and Programs Division (E143–01), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–2187; fax number: (919) 541–0516; and email address: *carey.angela@epa.gov.* For specific information regarding the risk modeling methodology, contact Ms. Darcie Smith, Health and Environmental Impacts Division (C539–02), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–2076; fax number: (919) 541–0840; and email address: *smith.darcie@epa.gov.* For information about the applicability of the NESHAP to a particular entity, contact Mr. John Cox, Office of Enforcement and Compliance Assurance, U.S. Environmental Protection Agency, WJC South Building (Mail Code 2227A), 1200 Pennsylvania Avenue NW, Washington DC 20460; telephone number: (202) 564–1395; and email address: *cox.john@epa.gov.*

SUPPLEMENTARY INFORMATION: *Preamble acronyms and abbreviations.* We use multiple acronyms and terms in this preamble. While this list may not be exhaustive, to ease the reading of this preamble and for reference purposes, the EPA defines the following terms and acronyms here:

ANSI American National Standards Institute
CAA Clean Air Act
CDX Central Data Exchange
CEDRI Compliance and Emissions Data Reporting Interface

Background information. On September 4, 2019 (84 FR 46610), the EPA proposed revisions to the National Emission Standards for Hazardous Air Pollutants for Miscellaneous Coating Manufacturing (MCM NESHAP) facilities NESHAP in conjunction with our RTR. In this action, we are finalizing decisions and revisions for the rule. We summarize some of the more significant comments we timely received regarding the proposed rule and provide our responses in this preamble. A summary of all other public comments on the proposal and the EPA's responses to those comments is available in the *Summary of Public Comments and Responses for Risk and Technology Review for Miscellaneous Coating Manufacturing,* in the MCM Docket (Docket ID No. EPA–HQ–OAR–2018–0747). A ''track changes'' version of the regulatory language that incorporates the changes in this action is available in the docket.

Organization of this document. The information in this preamble is organized as follows:

I. General Information
A. Does this action apply to me?
B. Where can I get a copy of this document and other related information?
C. Judicial Review and Administrative Reconsideration
II. Background
A. What is the statutory authority for this action?
B. What is the MCM source category and how does the NESHAP regulate HAP emissions from the source category?
C. What changes did we propose for the MCM source category in our September 4, 2019, proposal?
III. What is included in this final rule?

A. What are the final rule amendments based on the risk review for the MCM source category?
B. What are the final rule amendments based on the technology review for the MCM source category?
C. What are the final rule amendments addressing emissions during periods of SSM?
D. What other changes have been made to the NESHAP?
E. What are the requirements for submission of notifications, reports, and performance test data to the EPA?
F. What are the effective and compliance dates of the standards?
IV. What is the rationale for our final decisions and amendments for the NESHAP for the MCM source category?
A. Residual Risk Review for the MCM Source Category
B. Technology Review for the MCM Source Category
C. SSM Provisions
D. Electronic Reporting Provisions
E. Other Technical Amendments
F. Ongoing Emissions Compliance Demonstrations
V. Summary of Cost, Environmental, and Economic Impacts and Additional Analyses Conducted
A. What are the affected sources?
B. What are the air quality impacts?
C. What are the cost impacts?
D. What are the economic impacts?
E. What are the benefits?
F. What analysis of environmental justice did we conduct?
G. What analysis of children's environmental health did we conduct?
VI. Statutory and Executive Order Reviews
A. Executive Orders 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review
B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs
C. Paperwork Reduction Act (PRA)
D. Regulatory Flexibility Act (RFA)
E. Unfunded Mandates Reform Act (UMRA)
F. Executive Order 13132: Federalism
G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments
H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks
I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use
J. National Technology Transfer and Advancement Act (NTTAA) and 1 CFR Part 51
K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations
L. Congressional Review Act (CRA)

I. General Information

A. Does this action apply to me?

Regulated entities. Categories and entities potentially regulated by this action are shown in Table 1 of this preamble.

TABLE 1—NESHAP AND INDUSTRIAL SOURCE CATEGORIES AFFECTED BY THIS FINAL ACTION

NESHAP and source category	NAICS [1] codes
Miscellaneous Coating Manufacturing Industry.	3255, 3259

[1] North American Industry Classification System.

Table 1 of this preamble is not intended to be exhaustive, but rather to provide a guide for readers regarding entities likely to be affected by the final action for the source category listed. To determine whether your facility is affected, you should examine the applicability criteria in the appropriate NESHAP. If you have any questions regarding the applicability of any aspect of this NESHAP, please contact the appropriate person listed in the preceding **FOR FURTHER INFORMATION CONTACT** section of this preamble.

B. Where can I get a copy of this document and other related information?

In addition to being available in the docket, an electronic copy of this final action will also be available on the internet. Following signature by the EPA Administrator, the EPA will post a copy of this final action at: *https://www.epa.gov/stationary-sources-air-pollution/miscellaneous-coating-manufacturing-national-emission-standards.* Following publication in the **Federal Register**, the EPA will post the **Federal Register** version and key technical documents at this same website.

Additional information is available on the RTR website at *https://www.epa.gov/stationary-sources-air-pollution/risk-and-technology-review-national-emissions-standards-hazardous.* This information includes an overview of the RTR program, links to project websites for the RTR source categories.

C. Judicial Review and Administrative Reconsideration

Under Clean Air Act (CAA) section 307(b)(1), judicial review of this final action is available only by filing a petition for review in the United States Court of Appeals for the District of Columbia Circuit (the Court) by October 13, 2020. Under CAA section 307(b)(2), the requirements established by this final rule may not be challenged separately in any civil or criminal proceedings brought by the EPA to enforce the requirements.

Section 307(d)(7)(B) of the CAA further provides that only an objection to a rule or procedure which was raised with reasonable specificity during the period for public comment (including any public hearing) may be raised during judicial review. This section also provides a mechanism for the EPA to reconsider the rule if the person raising an objection can demonstrate to the Administrator that it was impracticable to raise such objection within the period for public comment or if the grounds for such objection arose after the period for public comment (but within the time specified for judicial review) and if such objection is of central relevance to the outcome of the rule. Any person seeking to make such a demonstration should submit a Petition for Reconsideration to the Office of the Administrator, U.S. EPA, Room 3000, WJC South Building, 1200 Pennsylvania Ave. NW, Washington, DC 20460, with a copy to both the person(s) listed in the preceding **FOR FURTHER INFORMATION CONTACT** section, and the Associate General Counsel for the Air and Radiation Law Office, Office of General Counsel (Mail Code 2344A), U.S. EPA, 1200 Pennsylvania Ave. NW, Washington, DC 20460.

II. Background

A. What is the statutory authority for this action?

Section 112 of the CAA establishes a two-stage regulatory process to address emissions of HAP from stationary sources. In the first stage, we must identify categories of sources emitting one or more of the HAP listed in CAA section 112(b) and then promulgate technology-based NESHAP for those sources. ''Major sources'' are those that emit, or have the potential to emit, any single HAP at a rate of 10 tons per year (tpy) or more, or 25 tpy or more of any combination of HAP. For major sources, these standards are commonly referred to as maximum achievable control technology (MACT) standards and must reflect the maximum degree of emission reductions of HAP achievable (after considering cost, energy requirements, and non-air quality health and environmental impacts). In developing MACT standards, CAA section 112(d)(2) directs the EPA to consider the application of measures, processes, methods, systems, or techniques, including but not limited to those that reduce the volume of or eliminate HAP emissions through process changes, substitution of materials, or other modifications; enclose systems or

processes to eliminate emissions; collect, capture, or treat HAP when released from a process, stack, storage, or fugitive emissions point; are design, equipment, work practice, or operational standards; or any combination of the above.

For these MACT standards, the statute specifies certain minimum stringency requirements, which are referred to as MACT floor requirements, and which may not be based on cost considerations. See CAA section 112(d)(3). For new sources, the MACT floor cannot be less stringent than the emission control achieved in practice by the best-controlled similar source. The MACT standards for existing sources can be less stringent than floors for new sources, but they cannot be less stringent than the average emission limitation achieved by the best-performing 12 percent of existing sources in the category or subcategory (or the best-performing five sources for categories or subcategories with fewer than 30 sources). In developing MACT standards, we must also consider control options that are more stringent than the floor under CAA section 112(d)(2). We may establish standards more stringent than the floor, based on the consideration of the cost of achieving the emissions reductions, any non-air quality health and environmental impacts, and energy requirements.

In the second stage of the regulatory process, the CAA requires the EPA to undertake two different analyses, which we refer to as the technology review and the residual risk review. Under the technology review, we must review the technology-based standards and revise them ''as necessary (taking into account developments in practices, processes, and control technologies),'' no less frequently than every 8 years, pursuant to CAA section 112(d)(6).[1] Under the residual risk review, we must evaluate the risk to public health remaining after application of the technology-based standards and revise the standards, if necessary, to provide an ample margin of safety to protect public health or to prevent, taking into consideration costs, energy, safety, and other relevant factors, an adverse environmental effect. The residual risk review is required within 8 years after promulgation of the technology-based standards, pursuant to CAA section 112(f). In conducting the residual risk review, if the EPA determines that the current standards provide an ample margin of safety to protect public health, it is not necessary to revise the MACT standards pursuant to CAA section 112(f).[2] For more information on the statutory authority for this rule, see the proposal preamble (84 FR 46610, September 4, 2019) and the memorandum, *CAA Section 112 Risk and Technology Reviews: Statutory Authority and Methodology,* December 14, 2017, available in the docket for this rulemaking.

B. What is the MCM source category and how does the NESHAP regulate HAP emissions from the source category?

The EPA promulgated the MCM NESHAP on December 11, 2003 (68 FR 69185). The standards are codified at 40 CFR part 63, subpart HHHHH. The MCM industry consists of facilities that are engaged in their manufacture without regard to the particular end uses or consumers of such products. The manufacturing of these products may occur in any combination at any facility. The source category covered by this MACT standard currently includes 43 facilities.

The MCM source category includes the collection of equipment (*i.e.,* process vessels; storage tanks; components such as pumps, valves, and connections; wastewater tanks; heat exchangers; and transfer racks) that is used to manufacture coatings at a facility. MCM operations may also include certain cleaning operations. Coatings manufactured at MCM facilities are materials such as paints, inks, or adhesives that are intended to be applied to a substrate to form a protective, decorative, or functional layer (*e.g.,* an adhesive) and consist of a mixture of resins, pigments, solvents, and/or other additives. Coatings are produced by a manufacturing operation in which materials are blended, mixed, diluted, or otherwise formulated. Coatings do not include materials made in processes where a formulation component is synthesized by a chemical reaction or separation activity and then transferred to another vessel where it is formulated to produce a material used as a coating, where the synthesized or separated component is not stored prior to formulation.

The equipment controlled by the MCM NESHAP includes process vessels, storage tanks for feedstocks and products, equipment leak components (pumps, compressors, agitators, pressure relief devices (PRDs), sampling connection systems, open-ended valves or lines, valves, connectors, and instrumentation systems), wastewater tanks, heat exchangers, and transfer racks.

The current NESHAP regulates process vessels and storage tanks based on the volume of the process vessel or storage tank and the maximum true vapor pressure of the organic HAP processed or stored. Control requirements range from the use of tightly fitted lids on process vessels to also capturing and reducing organic HAP emissions through the use of add-on controls (*i.e.,* a flare, oxidizer, or condenser). For halogenated vent streams from process vessels and storage tanks, the use of a flare is prohibited, and a halogen reduction device (*i.e.,* an acid gas scrubber) is required after a combustion control device. For storage tanks, facilities may comply with the provisions in 40 CFR part 63, subpart HHHHH, by complying with the provisions in 40 CFR part 63, subpart WW.

The NESHAP regulates emissions from equipment leaks at existing sources by requiring compliance with leak inspection and repair provisions using sight, sound, and smell in 40 CFR part 63, subpart R, or alternatively, the leak detection and repair (LDAR) provisions in 40 CFR part 63, subpart TT or UU. New sources are required to comply with the LDAR provisions in 40 CFR part 63, subpart TT or UU.

The NESHAP regulates wastewater streams by requiring the use of fixed roofs on wastewater tanks, treating the wastewater (either on-site or off-site) as a hazardous waste under 40 CFR part 264, 265, or 266, or using enhanced biological treatment if the wastewater contains less than 50 parts per million by weight (ppmw) of partially soluble HAP. If the wastewater is treated as a hazardous waste under 40 CFR part 264, 265, or 266, it may be treated by steam stripping or incineration. These standards apply only to wastewater streams that contain total partially soluble and soluble HAP at an annual average concentration greater than or equal to 4,000 ppmw and loads greater than or equal to 750 pounds per year (lb/yr) at an existing source. For new sources, these standards apply only to wastewater streams that contain total partially soluble and soluble HAP at an annual average concentration greater

[1] On April 21, 2020, as the Agency was preparing the final rule for signature, a decision was issued in *LEAN* v. *EPA,* 955 F. 3d. 1088 (D.C. Cir. 2020) in which the Court held that the EPA has an obligation to set standards for unregulated pollutants as part of technology reviews under CAA section 112(d)(6). At the time of signature, the mandate in that case had not been issued and the EPA is continuing to evaluate the decision.

[2] The Court has affirmed this approach of implementing CAA section 112(f)(2)(A): *NRDC* v. *EPA,* 529 F.3d 1077, 1083 (D.C. Cir. 2008) (''If EPA determines that the existing technology-based standards provide an 'ample margin of safety,' then the Agency is free to readopt those standards during the residual risk rulemaking.'').

than or equal to 1,600 ppmw and any partially soluble and soluble HAP load.

The NESHAP regulates transfer operations if the operation involves the bulk loading of coating products that contain 3.0 million gallons per year or more of HAP with a weighted average HAP partial pressure greater than or equal to 1.5 pounds per square inch, absolute. Regulated transfer operations are required to reduce emissions by using a closed vent system and a control device (other than a flare) to reduce emissions by at least 75 percent; using a closed vent system and a flare for a non-halogenated vent stream; or using a vapor balancing system. When a non-flare combustion device is used to control a halogenated vent stream, then a halogen reduction device must be used either before or after the combustion device. If used after the combustion device, the halogen reduction device must meet either a minimum 95-percent reduction or a maximum 0.45 kilograms per hour (kg/hr) emission rate of hydrogen halide or halogen. If used before the combustion device, the halogen reduction device must meet a maximum 0.45 kg/hr emission rate of hydrogen halide or halogen.

The NESHAP requires heat exchangers to meet the provisions of 40 CFR part 63, subpart F, 40 CFR 63.104. Section 63.104 requires the implementation of a LDAR or monitoring program for heat exchange systems, unless the system meets certain design and operation provisions, or it is a once-through system that meets certain National Pollution Discharge Elimination System (NPDES) permit provisions.

C. What changes did we propose for the MCM source category in our September 4, 2019, proposal?

On September 4, 2019, the EPA published a proposed rule in the **Federal Register** for the MCM NESHAP, 40 CFR part 63, subpart HHHHH, that took into consideration the RTR analyses. We proposed to find that after compliance with the current NESHAP (*i.e.,* MACT standards) the risks to public health from the source category are acceptable, and that additional emission controls are not necessary to provide an ample margin of safety. Based on our technology review, we did not identify any cost-effective developments in practices, processes, or control technologies for the source category. Accordingly, we proposed no changes to the existing emission control requirements in 40 CFR part 63, subpart HHHHH, based on the risk assessment or the technology review.

We proposed the following amendments to improve rule effectiveness, provide regulatory flexibility, and comply with a legal ruling:

- A new requirement for electronic submittal of notifications, semi-annual reports, and compliance reports (which include performance test reports);
- revisions to the SSM provisions of the NESHAP to ensure that they are consistent with the Court decision in *Sierra Club* v. *EPA,* 551 F. 3d 1019 (D.C. Cir. 2008), which vacated two provisions that exempted source owners or operators from the requirement to comply with otherwise applicable CAA section 112(d) emission standards during periods of SSM;
- revisions to account for instances where 40 CFR part 63, subpart HHHHH, cross-references other subparts that contain SSM provisions;
- language to add 40 CFR 63.8005(h) to clarify that any periods during which a control device for a process vessel is bypassed must be included in demonstrating compliance with the emission reduction provisions for process vessels in Table 1 to 40 CFR part 63, subpart HHHHH;
- revisions to 40 CFR 63.8000(b)(2), which allows the opening of a safety device at any time conditions require it to avoid unsafe conditions, to clarify that such an opening to avoid unsafe conditions is considered a deviation, unless it is a bypass of a control for a process vessel and accounted for as specified in 40 CFR 63.8005(h);
- removal of references to paragraph (d)(4) of the Occupational Safety and Health Administration (OSHA) Hazard Communication standard (29 CFR 1910.1200), which dealt with OSHA-defined carcinogens, and replacing that reference with a list of HAP that must be regarded as potentially carcinogenic based on EPA guidelines;
- a new requirement to fulfill performance testing and reestablish operating limits no less frequently than every 5 years for sources that are using add-on controls to demonstrate compliance, unless they are already required to perform periodic testing as a condition of renewing their title V operating permit; and
- to IBR alternative test methods and references to updated alternative test methods.

III. What is included in this final rule?

This action finalizes the EPA's determinations pursuant to the RTR provisions of CAA section 112 for the MCM source category. This action also finalizes the changes to the NESHAP described in section II.C of this preamble, as proposed.

A. What are the final rule amendments based on the risk review for the MCM source category?

This section describes the final decisions for the MCM NESHAP (40 CFR part 63, subpart HHHHH) being promulgated pursuant to CAA section 112(f). The EPA proposed no changes to this subpart based on the risk review conducted pursuant to CAA section 112(f). In this action, we are finalizing our proposed determination that risks from this source category are acceptable, and that the NESHAP at 40 CFR part 63, subpart HHHHH, provides an ample margin of safety to protect public health, and that more stringent standards are not necessary to prevent an adverse environmental effect. The EPA received no new data or other information during the public comment period that causes us to change that proposed determination. Therefore, we are not requiring additional emission controls under CAA section 112(f)(2) for this subpart in this action.

B. What are the final rule amendments based on the technology review for the MCM source category?

We determined that there are no developments in practices, processes, and control technologies that warrant revisions to the MACT standards for this source category. The EPA received no new data or other information during the public comment period that causes us to change that proposed determination. Therefore, we are not finalizing revisions to the MACT standards under CAA section 112(d)(6).

C. What are the final rule amendments addressing emissions during periods of SSM?

We are finalizing the proposed amendments to the MCM NESHAP to remove and revise provisions related to SSM. In its 2008 decision in *Sierra Club* v. *EPA* 551 F. 3d 1019 (D.C. Cir. 2008), the Court vacated portions of two provisions in the EPA's CAA section 112 regulations governing the emissions of HAP during periods of SSM. Specifically, the Court vacated the SSM exemption contained in 40 CFR 63.6(f)(1) and (h)(1), holding that under section 302(k) of the CAA, emissions standards or limitations must be continuous in nature and that the SSM exemption violates the CAA's requirement that some CAA section 112 standards apply continuously. Previously, the 2003 MCM NESHAP included exemptions for standards during SSM. As detailed in section IV.D

of the proposal preamble (84 FR 46610, September 4, 2019), the final rule removes the SSM exemptions (see 40 CFR 63.8000(a)), consistent with the Court decision in *Sierra Club* v. *EPA,* 551 F. 3d 1019 (D.C. Cir. 2008).

Table 10 to subpart HHHHH of 40 CFR part 63 (General Provisions applicability table) is being revised to change the specification of the requirements that apply during periods of SSM. We eliminated or revised certain recordkeeping and reporting requirements related to the eliminated SSM exemptions. The EPA also made other harmonizing changes to remove or modify inappropriate, unnecessary, or redundant language in the absence of the SSM exemptions. We proposed to find that facilities in this source category can meet the applicable emission standards in the MCM NESHAP at all times, including periods of startup and shutdown, without additional standards or work practices. The EPA considered the requirements for control device bypasses and for safety devices that we are finalizing in this rule when proposing to find that the standards can be met at all times after the SSM provisions are revised. We received no information to cause us to change our conclusion; therefore, the EPA is finalizing the proposed determination that no additional standards are needed to address emissions during startup and shutdown periods. The legal rationale and detailed changes for startup and shutdown periods that we are finalizing here are set forth in the September 4, 2019, preamble to the proposed rule. See 84 FR 46629 through 46630.

Further, as proposed, the EPA is not including standards for malfunctions, except as related to the proposed revisions related to control device bypasses and for safety devices. As discussed in section IV.D of the September 4, 2019, proposal preamble, the EPA interprets CAA section 112 as not requiring emissions that occur during periods of malfunction to be factored into development of CAA section 112 standards, although the EPA has the discretion to set standards for malfunctions where feasible. See 84 FR 46629 through 46630. For this source category, we proposed at 40 CFR 63.8005(h) to provide a method to account for control device bypass periods (including malfunction periods) when evaluating compliance with the overall control efficiency requirements for process vessels in Table 1 to 40 CFR part 63 subpart HHHHH, and we solicited commenters to provide additional information.

We are revising the General Provisions table to 40 CFR part 63, subpart HHHHH, to eliminate requirements that include rule language providing an exemption for periods of SSM. Finally, we are revising as proposed the Deviation Notification Report and related records as they relate to malfunctions, as further described below. As discussed in detail in the proposal preamble, these revisions are consistent with the requirement in 40 CFR 63.8000(a) that the standards apply at all times. Refer to section IV.D.1 of the proposal preamble for a detailed discussion of these amendments (84 FR 46629, September 4, 2019).

We are finalizing amendments to account for instances where 40 CFR part 63, subpart HHHHH, cross-references other subparts that contain SSM provisions. Listed in 40 CFR 63.8000(f) are the referenced provisions in subparts SS, TT, and UU of 40 CFR part 63 that contain references to SSM periods that will no longer apply after the compliance date for these amendments. Listed in 40 CFR 63.8000(f)(10) through (22) are the paragraphs or phrases within the paragraphs that will not apply after the applicable compliance date for the amendments as a result of the final SSM revisions.

Because we are finalizing the revisions to remove the SSM provisions and require compliance at all times, we are also finalizing the amendment to add 40 CFR 63.8005(h) to account for bypass periods in determining compliance with the emission percent reduction provisions in Table 1 to 40 CFR part 63, subpart HHHHH, for process vessels. These amendments will apply to process vessels with closed vent systems and add-on controls that contain bypass lines that could divert a vent stream to the atmosphere. We are finalizing the revisions that owners or operators must measure and record during each semiannual compliance period the hours that the control device was bypassed and the source's total operating hours. They must use the overall control efficiency required in Table 1, the total operating hours, and the control efficiency of the control device to determine the allowable bypass hours during the semiannual compliance period using Equation 1 in 40 CFR 63.8005(h). These changes are required because SSM periods that may involve bypassing of the control device cannot be excluded and must now be included in determining compliance.

Because we are finalizing the revisions to remove the SSM provisions and require compliance at all times, we are also finalizing the revisions to 40 CFR 63.8000(b)(2) so that opening of a safety device to avoid unsafe conditions is considered a deviation, unless it is a bypass of a control for a process vessel and accounted for as specified in 40 CFR 63.8005(h). We are also finalizing the proposed revisions to revise 40 CFR 63.8080(c), which is the provision requiring a record of each time a safety device is opened, to add additional recordkeeping provisions consistent with those for other deviations. In the event a safety device is opened, the owners or operators will be required to comply with the general duty provision in 40 CFR 63.8000(a) to minimize emissions at all times, and to report and record information related to deviations as specified in 40 CFR 63.8075 and 63.8080, respectively, unless it is a bypass of a control for a process vessel and accounted for as specified in 40 CFR 63.8005(h).

D. What other changes have been made to the NESHAP?

The EPA is amending 40 CFR 63.8055(b)(4), as proposed, to remove a reference to paragraph (d)(4) of the OSHA's Hazard Communication standard addressing OSHA-defined carcinogens. We are replacing the reference to carcinogens in 29 CFR 1910.1200(d)(4) with a new table, Table 11 to 40 CFR part 63, subpart HHHHH, that lists those organic HAP that must be included in calculating total organic HAP content of a coating material if they are present at 0.1 percent or greater by mass. We are including organic HAP in Table 11 to 40 CFR part 63, subpart HHHHH, if they were categorized in the *EPA's Prioritized Chronic Dose-Response Values for Screening Risk Assessments* (dated May 9, 2014) as a ''human carcinogen,'' ''probable human carcinogen,'' or ''possible human carcinogen'' according to *The Risk Assessment Guidelines of 1986* (EPA/600/8–87/045, August 1987), or as ''carcinogenic to humans,'' ''likely to be carcinogenic to humans,'' or with ''suggestive evidence of carcinogenic potential'' according to the *Guidelines for Carcinogen Risk Assessment* (EPA/630/P–03/001F, March 2005).

The EPA is making several additional revisions to 40 CFR part 63, subpart HHHHH, to clarify text or correct typographical errors, grammatical errors, and cross-reference errors. These editorial corrections and clarifications are summarized in Table 2 of this preamble.

TABLE 2—SUMMARY OF EDITORIAL AND MINOR CORRECTIONS TO 40 CFR PART 63, SUBPART HHHHH

Provision	Revision
40 CFR 63.7985(d)(2)	Remove the word ''future.''.
40 CFR 63.7990(a)	Revise 40 CFR 63.7990(a) to refer to the affected source definition that is in 40 CFR 63.7990(b), and not in 40 CFR 63.7985(a).
40 CFR 63.8000(a)(1)	Revise the reference to ''§§ 63.8005 through 63.8025'' to ''§§ 63.8005 through 63.8030.''.
40 CFR 63.8050(c)(3)	Correcting a printing error related to a May 13, 2005, amendment (70 FR 25676) to paragraph (c)(3) that resulted in deleting paragraphs (c)(3)(i) through (iii).
40 CFR 63.8075(c)(1)	Clarify the paragraph to say §§ 63.8005 through 63.8030 include heat exchangers.
40 CFR 63.8075(d)	Change the first reference to paragraph (d)(2) to instead refer to paragraph (d)(1).
40 CFR 63.8075(d)(2)(ii)	Remove the word ''initial.''.
40 CFR 63.8090(b)	Clarify the sentence to provide that you are in compliance with the subpart if you have a storage tank with a fixed roof, closed-vent system, and control device in compliance with 40 CFR part 60, subpart Kb, and you are in compliance with the monitoring, recordkeeping, and reporting requirements in the subpart.
40 CFR 63.8105, definition of ''Process vessel vent''	The EPA is not finalizing the proposed change to the last sentence of the definition, which would have replaced the words ''process vessel vent'' with ''§ 63.8075 vent.''.
Table 7 to 40 CFR part 63, subpart HHHHH	Remove 2-Butanone (MEK) for Partially Soluble Hazardous Air Pollutants.
Table 8 to 40 CFR part 63, subpart HHHHH	Correct ''FFFF'' to ''HHHHH.''.
Table 10 to 40 CFR part 63, subpart HHHHH	Change proposed column 3 entry for the row corresponding to § 63.6(f)(1) from ''Yes, before the compliance date specified in § 63.7995(e). No, on and after the compliance date specified in § 63.7995(e).'' to ''No. See § 63.8000(a).''.
Table 10 to 40 CFR part 63, subpart HHHHH	Change proposed column 3 entry for the row corresponding to § 63.6(h)(1) from ''Yes, before the compliance date specified in § 63.7995(e). No, on and after the compliance date specified in § 63.7995(e).'' to ''No. See § 63.8000(a).''.

We are including in the final rule a requirement for facilities to conduct control device performance testing no less frequently than once every 5 years when using emission capture systems and add-on controls to demonstrate compliance. For facilities with title V permits that require comparable periodic testing prior to permit renewal, no additional testing is required, and we included provisions in the rule to allow facilities to harmonize the NESHAP testing schedule with a facility's current title V testing schedule.

E. What are the requirements for electronic submission of notifications, reports, and performance test data to the EPA?

The EPA is requiring owners or operators of MCM facilities to submit electronic copies of certain required notifications, semiannual reports, performance test reports, and performance evaluation reports, through the EPA's Central Data Exchange (CDX) using the Compliance and Emissions Data Reporting Interface (CEDRI). The final rule requires that certain performance test results be submitted using the Electronic Reporting Tool. For the semiannual compliance reports, the final rule requires that owners or operators use the appropriate spreadsheet template to submit information to CEDRI. The final version of the template for this report is located on the CEDRI website.

The electronic submittal of the reports addressed in this rulemaking will increase the usefulness of the data contained in those reports, is in keeping with current trends in data availability and transparency, will further assist in the protection of public health and the environment, will improve compliance by facilitating the ability of regulated facilities to demonstrate compliance with requirements and by facilitating the ability of delegated state, local, tribal, and territorial air agencies and the EPA to assess and determine compliance, and will ultimately reduce burden on regulated facilities, delegated air agencies, and the EPA. Electronic reporting also eliminates paper-based, manual processes, thereby saving time and resources, simplifying data entry, eliminating redundancies, minimizing data reporting errors, and providing data quickly and accurately to the affected facilities, air agencies, the EPA, and the public. For a more thorough discussion of electronic reporting, see the memorandum, *Electronic Reporting Requirements for New Source Performance Standards (NSPS) and National Emission Standards for Hazardous Air Pollutants (NESHAP) Rules,* available in Docket ID No. EPA–HQ–OAR–2018–0747.

F. What are the effective and compliance dates of the standards?

The revisions to the MACT standards being promulgated in this action are effective on August 14, 2020.

For all of the provisions we are finalizing under CAA sections 112(d)(2) and (3), all affected source owners or operators must comply with all of the amendments no later than 3 years after the effective date of the final rule, or upon startup, whichever is later. As provided in CAA section 112(i), all new affected sources would comply with these provisions by the effective date of the final amendments to the MCM NESHAP, or upon startup, whichever is later.

All affected facilities would have to continue to meet the current provisions of 40 CFR part 63, subpart HHHHH, up to and no later than the applicable compliance date of the amended rule.

We are finalizing the amendments to the provisions for SSM by removing the exemptions from the emission limitations (*i.e.,* emission limits, operating limits, and work practice standards) during SSM periods and by removing the provision to develop and implement an SSM plan. We are also requiring that owners or operators take into account control device bypass periods, even if during SSM periods, when demonstrating compliance with the percent emission reduction provisions for process vessels in Table 1 to 40 CFR part 63, subpart HHHHH.

For all affected sources that commence construction or reconstruction on or before September 4, 2019, we are providing 3 years after the effective date of the final rule (or upon startup, whichever is later) for owners or operators to comply with the provisions that have been amended to remove the exemption from the emission limitations during SSM periods, with the exception of the vacated SSM exemptions contained in 40 CFR 63.6(f)(1) and (h)(1). We are

revising Table 10 to clarify that for all affected sources, these exemptions do not apply following the Court vacatur in *Sierra Club* v. *EPA,* 551 F. 3d 1019 (D.C. Cir. 2008). For all affected sources that commenced construction or reconstruction after September 4, 2019, we are requiring that owners or operators comply with the amended provisions by the effective date of the final rule (or upon startup, whichever is later).

We are also adding a provision that notifications, performance test results, and semiannual compliance reports be submitted electronically, and that the semiannual compliance report be submitted electronically using a new template. We are requiring that all sources begin complying with the new electronic reporting provisions beginning no later than 3 years after the regulation's effective date.

The EPA selected these compliance dates based on experience with similar industries and the EPA's detailed justification for the selected compliance dates is included in the preamble to the proposed rule (84 FR 46634, September 4, 2019).

IV. What is the rationale for our final decisions and amendments for the MCM source category?

For each issue, this section provides a description of what we proposed and what we are finalizing for the issue, the EPA's rationale for the final decisions and amendments, and a summary of key comments and responses. For all comments not discussed in this preamble, comment summaries and the EPA's responses can be found in the comment summary and response document available in the docket.

A. Residual Risk Review for the MCM Source Category

1. What did we propose pursuant to CAA section 112(f) for the MCM source category?

Pursuant to CAA section 112(f), the EPA conducted a residual risk review and presented the results of this review, along with our proposed decisions regarding risk acceptability and ample margin of safety, in the September 4, 2019, proposed rule for 40 CFR part 63, subpart HHHHH (84 FR 46610). The results of the risk assessment for the proposal are presented briefly below in Table 3 of this preamble. More detail is in the residual risk technical support document, *Residual Risk Assessment for the Miscellaneous Coating Manufacturing Source Category in Support of the 2019 Risk and Technology Review Proposed Rule,* available in the docket for this rulemaking.

Table 3 of this preamble provides a summary of the results of the inhalation risk assessment for the source category.

TABLE 3—MCM INHALATION RISK ASSESSMENT RESULTS [5]

Risk assessment	Number of facilities [1]	Maximum individual cancer risk (in 1 million) [2]	Population at increased risk of cancer ≥ 1-in-1 million	Annual cancer incidence (cases per year)	Maximum chronic noncancer TOSHI [3]	Maximum screening acute noncancer HQ [4]
Source Category	43	6	3,700	0.002	0.4	2
Whole Facility	.....	20	50,100	0.006	2	.....

[1] Number of facilities evaluated in the risk analysis.
[2] Maximum individual excess lifetime cancer risk due to HAP emissions from the source category.
[3] Maximum target organ-specific hazard index (TOSHI). The target organ system with the highest TOSHI for the source category is respiratory.
[4] The maximum estimated acute exposure concentration was divided by available short-term threshold values to develop an array of hazard quotient (HQ) values. HQ values shown use the lowest available acute threshold value, which in most cases is the reference exposure limit (REL). When an HQ exceeds 1, we also show the HQ using the next lowest available acute dose-response value. The HQ shown here is for glycol ethers, for which there are no other available acute dose-response values.
[5] For this source category, it was determined that baseline allowable emissions are equal to baseline actual emissions and, therefore, the risk summaries are the same.

The results of the inhalation risk modeling using the source category emissions for both actual and allowable emissions, as shown in Table 3 of this preamble, indicate the estimated cancer maximum individual risk (MIR) is 6-in-1 million, with chromium (VI) compounds from process vents as the major contributor to the risk. The total estimated cancer incidence from this source category is 0.002 excess cancer cases per year, or one excess case in every 500 years. Approximately 3,700 people are estimated to have cancer risks greater than or equal to 1-in-1 million from HAP emitted from the affected sources in this source category. The estimated maximum chronic noncancer TOSHI for the source category is 0.4 (respiratory), driven by emissions of acrylic acid from process vents. No one is exposed to TOSHI levels greater than 1 due to emissions from this source category.

The results of the inhalation risk modeling using whole facility emissions data, as shown in Table 3 of this preamble, indicate that the estimated MIR is 20-in-1 million with emissions of hydrazine from sources subject to other standards driving the risk. These include 40 CFR part 63 subparts FFFF (Miscellaneous Organic Chemicals Manufacturing NESHAP), H (Hazardous Organic NESHAP), and EEEE (Organic Liquids Distribution), which are not part of this source category. The total estimated whole facility cancer incidence is 0.006 excess cancer cases per year. Approximately 50,100 people are estimated to have cancer risks greater than or equal to 1-in-1 million. The estimated maximum chronic noncancer TOSHI is 2 (for the neurological target organ), driven by emissions of hydrogen cyanide from non-MCM source category emissions from carbon fiber production. Approximately 80 people are estimated to be exposed to noncancer hazard index (HI) levels greater than 1.

As shown in Table 3 of this preamble, for source category emissions, the highest acute HQ based on the reasonable worst-case scenario is 2, based on the REL for glycol ethers. This is the highest HQ that is outside facility boundaries. One facility is estimated to have an HQ greater than 1 based on the REL, which is the only available benchmark for glycol ethers.

Potential multipathway health risks under a fisher and farmer/gardener scenario were identified using a three-tier screening assessment of the HAP known to be persistent and bio-

accumulative in the environment (PB–HAP) emitted by facilities in this source category. For carcinogenic PB–HAP, one facility emits arsenic compounds, while two facilities emit polycyclic organic matter (POM). None of these emissions exceed a Tier 1 cancer screening value for arsenic or POM. For noncarcinogenic PB–HAP, one facility emits cadmium compounds and one facility emits mercury compounds. None of these emissions exceed a Tier 1 noncancer screening value for cadmium or mercury. Further analyses (*i.e.,* Tier 2 or 3 screens) were not performed. For lead compounds, we did not estimate any exceedances of the lead National Ambient Air Quality Standards (NAAQS).

A screening-level evaluation of the potential adverse environmental risk associated with emissions of the PB–HAP listed above, plus acid gases (hydrogen chloride is the only reported acid gas), indicated that no ecological benchmarks were exceeded. For lead compounds, we did not estimate any exceedances of the secondary lead NAAQS.

We weighed all health risk factors, including those shown in Table 2 of this preamble, in our risk acceptability determination and proposed that the residual risks from the MCM source category are acceptable (section IV.B.1 of the proposal preamble, 84 FR 46625, September 4, 2019).

We then considered whether 40 CFR part 63, subpart HHHHH, provides an ample margin of safety to protect public health and prevents, taking into consideration costs, energy, safety, and other relevant factors, an adverse environmental effect. In considering whether the standards should be tightened to provide an ample margin of safety to protect public health, we considered the same risk factors that we considered for our acceptability determination and also considered the costs, technological feasibility, and other relevant factors related to emissions control options that might reduce risk associated with emissions from the source category. Related to risk, the baseline risks were low, and regardless of the availability of further control options, little risk reduction could be realized. As discussed further in section IV.B of this preamble, the only developments identified in the technology review were control options for inorganic HAP and organic HAP from process vessels. Because the baseline risks are being driven by inorganic HAP from process vessels, we evaluated a control option for inorganic HAP emissions from process vessels located at MCM facilities that would be similar to those included in 40 CFR part 63, subpart CCCCCCC, the NESHAP for Area Sources for Paints and Allied Products Manufacturing. Additionally, we evaluated increasing the control efficiency requirements for organic HAP emissions from process vessels. The process vessel options did not result in a decrease to the MIR or to the maximum chronic noncancer TOSHI because the MIR facility already had controls in place. However, there was a reduction seen in the population exposed to a cancer risk of 1-in-1 million from 3,700 to 1,900 due to emissions reductions at other facilities. But, as described in section IV.C of the proposal preamble (84 FR 46626, September 4, 2019), we determined that these options were not cost effective. Therefore, given the low baseline risks and lack of options for further risk reductions, we proposed that additional emission controls for this source category are not necessary to provide an ample margin of safety (see section IV.B.2 of the proposal preamble, 84 FR 46626, September 4, 2019).

2. How did the risk review change for the MCM Source Category?

We have not changed any aspect of the risk assessment for the MCM source category as a result of public comments received on the September 4, 2019, proposal.

3. What key comments did we receive on the risk review, and what are our responses?

We received comments in support of and against the proposed residual risk review and our determination is that no revisions were warranted under CAA section 112(f)(2) for the source category. Generally, the comments that were not supportive of the determination from the risk reviews suggested changes to the underlying risk assessment methodology. For example, one commenter stated that the EPA should lower the acceptability benchmark so that risks below 100-in-1 million are unacceptable, include emissions outside of the source category assessed, and assume that pollutants with noncancer health risks have no safe level of exposure. After review of all the comments received, we determined that no changes are needed to the risk assessment. The comments and our specific responses can be found in the document, *Summary of Public Comments and Responses for Risk and Technology Review for Miscellaneous Coating Manufacturing,* available in the docket for this rulemaking.

4. What is the rationale for our final approach and final decisions for the risk review?

As noted in our proposal, the EPA sets standards under CAA section 112(f)(2) using ''a two-step standard-setting approach, with an analytical first step to determine an 'acceptable risk' that considers all health information, including risk estimation uncertainty, and includes a presumptive limit on the maximum individual risk (MIR) of approximately 1-in-10 thousand'' (see 54 FR 38045, September 14, 1989). We weigh all health risk factors in our risk acceptability determination, including the cancer MIR, cancer incidence, the maximum cancer TOSHI, the maximum acute noncancer HQ, the extent of noncancer risks, the distribution of cancer and noncancer risks in the exposed population, and the risk estimation uncertainties.

Since proposal, neither the risk assessment nor our determinations regarding risk acceptability, ample margin of safety, or adverse environmental effects have changed. For the reasons explained in the proposed rule, we determined that the risks from the MCM source category are acceptable, the current standards provide an ample margin of safety to protect public health, and more stringent standards are not necessary to prevent an adverse environmental effect. Therefore, we are not revising this subpart to require additional controls pursuant to CAA section 112(f)(2) based on the residual risk review, and we are readopting the existing standards under CAA section 112(f)(2).

B. Technology Review for the MCM Source Category

1. What did we propose pursuant to CAA section 112(d)(6) for the MCM source category?

Sources of HAP emissions regulated by the MCM NESHAP are process vessels, storage tanks, transfer racks, equipment leaks, wastewater streams, and heat exchange systems. MCM processes occur as batch operations, which involve intermittent or discontinuous feed of raw materials into equipment, and generally involve emptying of the equipment after the operation ceases and prior to beginning a new operation.

For process vessels, we evaluated two options that could be potentially considered technology developments under CAA section 112(d)(6). In the first option, we considered increasing the control efficiency requirement for process vessels at existing sources to

match the control requirement for new sources, which would increase the control efficiency for organic HAP with a vapor pressure equal to or greater than 0.6 kilopascals from 75 percent to 95 percent. We consider this option to be a new development because several facilities have controlled all process vessels with thermal oxidizers to comply with the NESHAP.

We estimated the costs of installing a thermal oxidizer on the six plants in the MCM source category that currently do not have a thermal oxidizer installed on process vessels. The costs were estimated using the *EPA Air Pollution Control Cost Manual* cost spreadsheet for thermal oxidizers [3] and the process vent flow rate from the National Emissions Inventory (NEI) or the facility operating permit. The estimated cost effectiveness for these facilities ranged from $20,000 per ton HAP removed to $150,000 per ton HAP removed.

The second option for process vessels that we considered was to require controls to limit particulate matter (PM) HAP emissions when dry materials (*e.g.,* pigments) containing inorganic HAP are added to the process vessel. We considered provisions that would be similar to those included in 40 CFR part 63, subpart CCCCCCC, the NESHAP for Area Sources for Paints and Allied Products Manufacturing. This option would reflect the fact that several facilities subject to 40 CFR part 63, subpart HHHHH, have process vessels controlled with fabric filters when dry materials are being added.

We estimated costs for both a fabric filter baghouse and a cartridge filter type of particulate control with a flow rate of 1,000 cubic feet per minute, plus 150 feet of flexible duct to capture the fugitive PM when dry matter is being added to the mixing vessel. The estimated cost effectiveness for this option ranged from $310,000 to $2,100,000 per ton of particulate HAP reduced. We also evaluated whether pigments could be added in a wetted or paste form, but not all pigments are available or can be used in wetted or paste form.

The EPA did not find the control technology development options considered for process vessels in this technology review to be cost effective or, in some cases, technologically feasible. Consequently, the EPA proposed that it is not necessary to amend the standards for process vessels under the technology review.

[3] *https://www.epa.gov/economic-and-cost-analysis-air-pollution-regulations/cost-reports-and-guidance-air-pollution.*

The MCM NESHAP requires existing sources to comply with the equipment leaks provisions in 40 CFR part 63, subpart R, NESHAP for Gasoline Distribution Facilities (Bulk Gasoline Terminals and Pipeline Breakout Stations); subpart TT, NESHAP for Equipment Leaks, Control Level 1; or subpart UU, NESHAP for Equipment Leaks, Control Level 2. New sources must comply with the provisions of subpart UU or TT. Based on developments in other similar source categories, we identified as a technology alternative to the current standard a more stringent provision for existing sources that would eliminate sensory monitoring and require instrument monitoring with lower leak definitions than specified in 40 CFR part 63, subpart TT. For this alternative, we estimated the incremental emission reductions and cost effectiveness of employing instrument monitoring (EPA Method 21) with an equipment leak defined as instrument readings of 500 parts per million by volume (ppmv) for valves, 2,000 ppmv for pumps, and 500 ppmv for connectors. We estimated the costs of requiring instrument monitoring with more stringent leak definitions for four model plants with 25, 50, 100, or 200 process vessels. The estimated cost effectiveness for these model plants ranged from $107,000 per ton HAP removed to $22,000 per ton HAP removed for the smallest to largest model plant, and these values are higher than organic HAP cost-effectiveness values that we historically have considered reasonable. The EPA did not find the leak detection instrument monitoring option that was evaluated to be cost effective. Consequently, the EPA proposed that it was not necessary to amend the standards for equipment leaks under the technology review.

The MCM NESHAP regulates wastewater streams that contain total partially soluble and soluble HAP at an annual average concentration greater than or equal to 4,000 ppmw and load greater than or equal to 750 lb/yr at existing sources, or that contain greater than or equal to 1,600 ppmw and any partially soluble and soluble HAP load at new sources. Wastewater tanks used to store regulated wastewater streams must have a fixed roof, which may have openings necessary for proper venting of the tank, such as a pressure/vacuum vent or j-pipe vent. Regulated wastewater streams must be conveyed using hard piping and treated as a hazardous waste in accordance with 40 CFR part 264, 265, or 266 either on-site or off-site. Alternatively, if the wastewater contains less than 50 ppmw of partially soluble HAP, it may be treated in an enhanced biological treatment system that is located either on-site or off-site.

Because our technology review identified no developments in practices, processes, or controls for reducing wastewater emissions at MCM facilities, we evaluated developments in other industries with wastewater streams that contain organic HAP. We reviewed three options that were considered in other industry technology reviews for their applicability to the MCM wastewater streams. These options were:

(1) Requiring wastewater drain and tank controls at facilities.

(2) Requiring specific performance parameters (minimum fraction biodegraded, f_{bio}) for an enhanced biological unit beyond those required in the Benzene NESHAP.

(3) Requiring wastewater streams with a volatile organic compound (VOC) content of 750 ppmw or higher to be treated by steam stripping prior to any other treatment process for facilities with high organic loading rates (*i.e.,* facilities with total annualized benzene quantity of 10 megagrams per year or more).

The EPA did not find any of the three wastewater stream control options evaluated to be cost effective. Consequently, the EPA proposed that it was not necessary to amend the standards for wastewater streams under the technology review.

The EPA did not identify in our technology review any developments in practices, processes, and control technologies for storage tanks, transfer operations (*i.e.,* bulk loading) of coating products, or heat exchange systems that were not already considered in the development of the original MACT.

Further explanation of the assumptions and methodologies for all options evaluated are provided in the memorandum, *Clean Air Act Section 112(d)(6) Technology Review for the Miscellaneous Coating Manufacturing Source Category,* available in the docket to this action.

2. How did the technology review change for the MCM source category?

We are making no changes to the conclusions of the technology review and are finalizing the results of the technology review for the MCM source category as proposed.

3. What key comments did we receive on the technology review, and what are our responses?

Comment: Some of the commenters supported the EPA's proposed

determination that no changes to the MCM NESHAP were needed based on the technology review.

However, one commenter argued that the standard should be strengthened to reduce HAP emissions. The commenter argued that the EPA should establish a standard of zero allowed leaks to prohibit all uncontrolled releases, or to establish more stringent standards based on the latest advancements in LDAR. The commenter also argued that the EPA should establish more stringent standards for HAP metals based on the use of fabric filters when dry materials are added to process vessels, as in the Paints and Allied Products Manufacturing rule for area sources. Finally, the commenter argued that the EPA should establish standards for storage vessels based on internal floating roofs (IFR) or the use of closed vent systems and recovery or destruction devices. The commenter argued that CAA section 112(d)(6) does not allow the EPA to use cost as a factor in deciding whether more stringent standards should be adopted.

Response: In this technology review, we specifically looked for developments in practices, processes, and controls, including improvements in previously considered control technologies, and concluded there were no cost-effective developments applicable to this source category. The comment suggesting additional or more stringent controls be imposed has not provided data to support a revision to the proposed technology review; for this reason, we are adopting no changes to the NESHAP under the technology review.

With respect to the role of cost in our decisions under the technology review, we note that courts have not required the EPA to demonstrate that a technology is ''cost-prohibitive'' in order not to require adopting a new technology under CAA section 112(d)(6); a simple finding that a control is not cost effective is enough. See *Association of Battery Recyclers, et al.* v. *EPA,* et al., 716 F.3d 667, 673–74 (D.C. Cir. 2015) (approving the EPA's consideration of cost as a factor in its 42 U.S.C. 7412(d)(6) decision-making and the EPA's reliance on cost effectiveness as a factor in its standard-setting).

The option to require controls to limit PM HAP emissions from process vessels in which dry materials containing inorganic HAP are added to the process vessel was considered during the proposal for this rule. As stated in the MCM technology review memorandum, *Clean Air Act Section 112(d)(6) Technology Review for Process Vessels, Storage Tanks, Equipment Leaks, Wastewater Streams, Transfer Operations, and Heat Exchange Systems Located in the Miscellaneous Coating Manufacturing Source Category* (Docket Item No. EPA–HQ–OAR–2018–0747–0033), we reviewed the permits for the 12 facilities subject to 40 CFR part 63, subpart HHHHH, for which the 2014 NEI included emissions of particulate HAP and found that the permits for all but one of the facilities confirmed that some type of particulate control was already fitted on the process vessels. These controls included baghouse fabric filters, cartridge filters, and wet scrubbers, and we proposed that it was not cost effective to require any additional PM controls.

Also, as described in the MCM technology review memorandum, we evaluated installing an IFR, external floating roof, closed vent system to an emission control device, vapor balancing, and considered maximum total vapor pressure thresholds; however, we did not identify any control technology development options for storage tanks to be cost effective.

Finally, in the MCM technology review memorandum, we concluded that more stringent leak definitions for pumps, valves, and connectors using EPA Method 21 equipment leak monitoring were not cost effective for this source category.

4. What is the rationale for our final approach for the technology review?

For the reasons explained in the preamble to the proposed rule (84 FR 46626, September 4, 2019) and in the comment responses above in section IV.B.3 of this preamble, and the response to comment document, we are making no changes and are finalizing the results of the technology review as proposed.

C. SSM Provisions

1. What did we propose?

In the September 4, 2019, action, we proposed amendments to the MCM NESHAP to remove and revise provisions related to SSM that are not consistent with the requirement that the standards apply at all times. More information concerning the elimination of SSM provisions is in the preamble to the proposed rule (84 FR 46629, September 4, 2019).

We proposed amendments to account for instances where 40 CFR part 63, subpart HHHHH, cross-references other subparts that contain SSM provisions. We proposed 40 CFR 63.8000(f) that lists the referenced provisions, including individual paragraphs or phrases, in subparts SS, TT, and UU of 40 CFR part 63 that contain references to SSM periods that will no longer apply after the compliance date for the final amendments as a result of the final SSM revisions.

Because we proposed to remove the SSM provisions and require compliance at all times, we proposed to amend 40 CFR 63.8000(c) to account for bypass periods in determining compliance with the emission percent reduction provisions in Table 1 to 40 CFR part 63, subpart HHHHH, for process vessels. These amendments apply to process vessels with closed vent systems and add-on controls that contain bypass lines that could divert a vent stream to the atmosphere. We proposed that owners or operators must measure and record during each semiannual compliance period the hours that the control device was bypassed and the source's total operating hours. They must then use the overall control efficiency required in Table 1, the total operating hours, and the control efficiency of the control device to determine the allowable bypass hours during the semiannual compliance period using proposed Equation 1 in 40 CFR 63.8005(h). These changes are required because SSM periods that may involve bypassing of the control device cannot be excluded and must now be included in determining compliance.

Because we proposed to remove the SSM provisions and require compliance at all times, we proposed to revise 40 CFR 63.8000(b)(2) so that opening of a safety device to avoid unsafe conditions is considered a deviation, unless it is a bypass of a control for a process vessel and accounted for as specified in 40 CFR 63.8005(h). We also proposed to revise 40 CFR 63.8080(c), which is the provision to keep a record of each time a safety device is opened, to add additional recordkeeping provisions consistent with those for other deviations. As a result of these proposed changes, the opening of a safety device would be considered a deviation from the emission limits for sources using closed vent systems and add-on control devices to comply with the emission limitations in 40 CFR part 63, subpart HHHHH, unless it is a bypass of a control for a process vessel and accounted for as specified in 40 CFR 63.8005(h). In the event a safety device is opened, the owners or operators would be required to comply with the general duty provision in 40 CFR 63.8000(a) to minimize emissions at all times and to report and record information related to deviations as specified in 40 CFR 63.8075 and 63.8080, respectively, unless it is a bypass of a control for a process vessel

and accounted for as specified in 40 CFR 63.8005(h).

2. What changed since proposal?

We are finalizing the SSM provisions as proposed with no changes (84 FR 46629, September 4, 2019).

We are also revising the bypass provisions to allow the use of bypass valve or damper position indicators to determine the time and duration of possible bypasses as an alternative to the proposed requirement to use a flow indicator. In the final rule, we are providing the following options to comply with the bypass monitoring requirements: (1) Use a flow indicator that provides a continuous reading of flow and no flow, (2) use valve position indicator or bypass damper indicator that provides a continuous reading of damper position, or (3) secure the bypass line valve in the non-diverting position with a car-seal or a lock-and-key type configuration. For flow indicators, facilities will have to perform a flow meter verification check annually. The annual verification check must be performed for at least two points, one at the instrument's zero and the other at the instrument's span. For valve position indicators, facilities must ensure that any bypass line valve or damper is in the closed position through continuous monitoring of valve position when the control device is in operation. The monitoring system must be inspected semiannually to verify that the monitor will accurately indicate valve position. For car-seal or lock-and-key type configurations, facilities must ensure that any seal or closure mechanism is maintained in the non-diverting position and the vent stream is not diverted through a bypass line. The visual inspections on the seal or closure mechanism must be completed at least once every month.

We are finalizing the provisions related to safety device openings in 40 CFR 63.8000(b)(2) and 63.8080(c) as proposed with no changes (84 FR 46632, September 4, 2019).

We have corrected an error in the proposed amendatory language at 40 CFR 63.7995(e) (84 FR 46640). In the proposal, we indicated that sources that began construction or reconstruction on or before the publication of the final rule in the **Federal Register** are given 3 years to comply with the provisions listed in 40 CFR 63.7995(e)(1) through (5). That was incorrect and the text should have indicated that those that began construction or reconstruction on or before the proposal publication date of September 4, 2019, have 3 years to comply with the provisions listed in 40 CFR 63.7995(e)(1) to (5).

3. What key comments did we receive and what are our responses?

Comment: One commenter requested specific SSM provisions for PRDs, flares, and maintenance venting. The commenter requested that the opening of a safety device be allowed if it is a PRD meeting the requirements in 40 CFR part 63, subpart TT (40 CFR 63.1010 or 63.1011) or UU (40 CFR 63.1029 or 63.1030), and suggested certain work practices are followed that were specified by the commenter. The commenter also requested that certain types of safety devices and PRDs be exempt from the requirements for safety devices.

The commenter requested that the definition of ''process vessel vent'' be revised to exclude ''maintenance vents after the equipment has been washed or purged in accordance with site maintenance practices to minimize, to the extent possible, emissions of HAP.'' The commenter also suggested as a second option, if the EPA decides to regulate HAP emissions from maintenance activities associated with process vessel vents, that the EPA should add work practice standards in place of emission limitations, consistent with the language in the Petroleum Refinery MACT, 40 CFR 63.643(c), and the proposed changes to the Ethylene Production MACT, 40 CFR 63.1103(e)(5).

The commenter requested that, consistent with the Column 3 note on 40 CFR 63.6(h)(2) through (9) in Table 10 to 40 CFR part 63, subpart HHHHH, the EPA should clarify the ''Yes'' language on 40 CFR 63.6(h)(1) by adding the italicized language as follows: ''Yes, before the compliance date specified in § 63.7995(e), *specifically for flares subject to Method 22 observations that are required as part of a compliance assessment.* No, on or after the compliance date specified in § 63.7995(e).''

Response: We are making none of the suggested changes because they are not necessary. There is a low likelihood of PRDs or flares being used in this source category because operations are conducted at ambient conditions (*i.e.,* process overpressures are less likely because operations are conducted at lower temperature and pressures) and facilities typically comply with the standards using thermal oxidizers or condensers. Additionally, the bypass provisions apply to all SSM events, including events associated with maintenance venting, and no examples were provided to the EPA to support adding provisions for maintenance venting in the MCM source category.

4. What is the rationale for our final approach for the SSM provisions?

We evaluated all comments on the EPA's proposed amendments to the SSM provisions. For the reasons explained in the proposed rule, we determined that these amendments to the SSM provisions for the MCM NESHAP remove and revise provisions related to SSM that are not consistent with the requirement that the standards apply at all times. More information concerning the amendments we are finalizing for SSM provisions is in the preamble to the proposed rule (84 FR 46629, September 4, 2019). Therefore, we are finalizing our approach for the SSM provisions as proposed.

D. Electronic Reporting Provisions

1. What did we propose?

In the September 4, 2019, document, we proposed to require owners or operators of MCM sources to submit electronic copies of notifications, reports, and performance tests through the EPA's CDX, using the CEDRI. These include the initial notifications required in 40 CFR 63.9(b) and 63.8070(b), the NOCS required in 40 CFR 63.9(h) and 63.8075(d), the performance test report required in 40 CFR 63.8075(f), the performance evaluation report required in 40 CFR 63.8075(g), and the semiannual reports required in 40 CFR 63.8075(b) and (c). A description of the electronic submission process is provided in the memorandum, *Electronic Reporting Requirements for New Source Performance Standards (NSPS) and National Emission Standards for Hazardous Air Pollutants (NESHAP) Rules,* August 8, 2018, available in the docket for this rulemaking. The proposed rule requirements would replace the current rule requirements to submit the notifications and reports to the Administrator at the appropriate address listed in 40 CFR 63.13. The proposed rule requirement would not affect submittals required by state air agencies. The proposed compliance schedule language in 40 CFR 63.8075(h) for submission of initial compliance reports, NOCS reports, and compliance reports would have provided 3 years after the final rule is published to begin electronic reporting.

2. What changed since proposal?

We are finalizing the electronic reporting provisions as proposed with no changes (84 FR 46632, September 4, 2019).

We are revising the proposed electronic reporting template to incorporate changes identified in the

public comments and described completely in the *Summary of Public Comments and Responses for Risk and Technology Review for Miscellaneous Coating Manufacturing,* available in the docket for this rulemaking.

3. What key comments did we receive and what are our responses?

Comment: The EPA received comments that identified several corrections and additions to the draft CEDRI template and described them in detail in their comment letter. These changes to the draft CEDRI template are described completely in the *Summary of Public Comments and Responses for Risk and Technology Review for Miscellaneous Coating Manufacturing,* available in the docket for this rulemaking.

Response: The EPA has evaluated these comments and has made the appropriate corrections to the CEDRI template as described in *Summary of Public Comments and Responses for Risk and Technology Review for Miscellaneous Coating Manufacturing,* available in the docket for this rulemaking.

4. What is the rationale for our final approach for the electronic reporting provisions?

For the reasons explained in the preamble to the proposed rules (84 FR 46632, September 4, 2019), and in the comment responses above in section IV.D.3 of this preamble, and in the response to comment document, we are finalizing the electronic reporting provisions for the MCM NESHAP, as proposed. We are revising the CEDRI reporting template as appropriate to incorporate the corrections and additions identified in the public comments.

E. Other Technical Amendments

1. What did we propose?

The EPA proposed to amend 40 CFR 63.8055(b)(4) to remove reference to paragraph (d)(4) of the OSHA's Hazard Communication standard, which dealt with OSHA-defined carcinogens. We proposed to replace these references to carcinogens in 29 CFR 1910.1200(d)(4) with a list (in proposed new Table 11 to 40 CFR part 63, subpart HHHHH) of those organic HAP that must be included in calculating total organic HAP content of a coating material if they are present at 0.1 percent or greater by mass. We also proposed additional technical and editorial corrections that were listed in Table 4 of the proposal preamble.

2. What changed since proposal?

We are finalizing the technical amendments as proposed with no changes (84 FR 46633, September 4, 2019).

3. What key comments did we receive and what are our responses?

We received comments supporting the addition of Table 11 to 40 CFR part 63, subpart HHHHH. We also received comments indicating several additional technical and editorial corrections that are detailed in the *Summary of Public Comments and Responses for Risk and Technology Review for Miscellaneous Coating Manufacturing,* available in the docket for this rulemaking.

4. What is the rationale for our final approach for the other technical amendments?

For the reasons explained in the preamble to the proposed rules (84 FR 46633, September 4, 2019), in the comment responses above in section IV.E.3 of this preamble, and in the response to comment document, we are finalizing the other technical amendments for the MCM NESHAP, as proposed. The proposed technical amendments, to include the new Table 11, are being finalized in this action. The editorial corrections proposed in Table 4 of the proposal preamble are being finalized, with edits based on responses from commenters. These edits are shown in Table 2 of this preamble.

F. Ongoing Emissions Compliance Demonstrations

1. What did we propose?

We proposed to require owners or operators of facilities complying with the standards using a closed vent system and add-on controls to control emissions to perform periodic testing to confirm the performance of the add-on control device. We proposed to require owners or operators that are not already on a 5-year testing schedule to conduct the first of the periodic performance tests within 3 years of the effective date of the revised standards. Afterward, the owners or operators would conduct periodic testing before they renew their operating permits, but no longer than 5 years following the previous performance test. Additionally, owners or operators of facilities that have already tested as a condition of their permit within the last 2 years before the effective date would be permitted to maintain their current 5-year schedule and not be required to move up the date of the next test to the 3-year date specified above.

2. What changed since proposal?

We are finalizing the periodic performance testing and ongoing compliance demonstration provisions as proposed with no changes (84 FR 46634, September 4, 2019).

3. What key comments did we receive and what are our responses?

Comment: The EPA received comments that performance testing should not be required except when the facility has a change in operations, or where the change is not considered to be within the previously established worst-case conditions as specified in 40 CFR 63.8005(d)(1)(iv). The EPA also received comments that periodic performance testing should only be required for thermal oxidizers and should not be required for carbon adsorbers or for condensers, and that the EPA should not eliminate design evaluations of small control devices. See 40 CFR 63.8000(d)(2). The commenters argued that testing small control devices is often impractical (for example, once-through carbon adsorption) and needless where the performance (such as for condensers) can be predicted with a high degree of certainty.

Response: We disagree that performance tests should only be required when the facility has a change in operations. As explained in the preamble to the proposed rule, periodic performance tests help identify potential degradation of the add-on control device over time and ensure the control device remains effective, reducing the potential for acute emissions episodes or noncompliance. Also as explained in the preamble to the proposed rule, many facilities using add-on controls to demonstrate compliance with the NESHAP are currently required to conduct performance tests every 5 years as a condition for renewing their title V operating permit. The requirement to conduct testing every 5 years also eliminates uncertainty of determining whether a change in facility operations should trigger a new performance test. Further, removing the design evaluation for small control devices will not affect facilities using condensers because they may still comply by meeting the condenser outlet temperature requirements specified in Table 1 to 40 CFR part 63, subpart HHHHH. We do not expect many facilities to be controlling with carbon adsorbers, and, therefore, we are not exempting carbon adsorbers from these requirements.

The comments and responses on the proposed performance testing requirements are detailed in the

Summary of Public Comments and Responses for Risk and Technology Review for Miscellaneous Coating Manufacturing, available in the docket for this rulemaking.

4. What is the rationale for our final approach for the ongoing compliance demonstrations?

For the reasons explained in the preamble to the proposed rules (84 FR 46634, September 4, 2019) and in the comment responses above in section IV.F.3 of this preamble and the response to comment document, we are finalizing the periodic testing provisions for the MCM NESHAP, as proposed.

V. Summary of Cost, Environmental, and Economic Impacts and Additional Analyses Conducted

A. What are the affected sources?

Currently, 43 major sources subject to the MCM NESHAP are operating in the United States. The affected source under the NESHAP is the facility-wide collection of equipment used to manufacture coatings and includes all process vessels; storage tanks for feedstocks and products; components such as pumps, compressors, agitators, pressure relief devices, sampling connection systems, open-ended valves or lines, valves, connectors, and instrumentation systems; wastewater tanks; transfer racks; and cleaning operations. A coating is defined as material such as paint, ink, or adhesive that is intended to be applied to a substrate and consists of a mixture of resins, pigments, solvents, and/or other additives, where the material is produced by a manufacturing operation where materials are blended, mixed, diluted, or otherwise formulated.

B. What are the air quality impacts?

At the current level of control, estimated emissions of volatile organic HAP from the MCM source category are approximately 405 tpy.

The final amendments require that all 43 major sources in the MCM source category comply with the relevant emission standards at all times, including periods of SSM. We were unable to quantify the emissions that occur during periods of SSM or the specific emissions reductions that will occur as a result of this action. However, eliminating the SSM exemption has the potential to reduce emissions by requiring facilities to meet the applicable standard during SSM periods.

Indirect or secondary air emissions impacts are impacts that will result from the increased electricity usage associated with the operation of control devices (*e.g.,* increased secondary emissions of criteria pollutants from power plants). Energy impacts consist of the electricity and steam needed to operate control devices and other equipment. The amendments will have no effect on the energy needs of the affected facilities and will, therefore, have no indirect or secondary air emissions impacts.

C. What are the cost impacts?

We estimate that to comply with the final amendments, each facility in the MCM source category will experience increased reporting and recordkeeping costs. The recordkeeping and reporting costs are presented in section VI.C of this preamble. The costs include time to read and understand the rule amendments. Costs associated with elimination of the SSM exemptions were estimated as part of the reporting and recordkeeping costs and include time for re-evaluating previously developed SSM record systems. Costs associated with the provision to electronically submit notifications and semi-annual compliance reports using CEDRI were estimated as part of the reporting and recordkeeping costs and include time for becoming familiar with CEDRI and the reporting template for semi-annual compliance reports.

We are also finalizing a provision for performance testing no less frequently than every 5 years for sources in the MCM source category using add-on controls to demonstrate compliance. We estimate that 12 of the facilities subject to the MCM NESHAP and using add-on control devices will incur costs to conduct control device performance testing because they are not required by their permits to conduct testing every 5 years. This total does not include facilities in the MCM source category that have add-on controls and are currently required to perform periodic performance testing as a condition of their state operating permit. The cost for a facility to conduct a destruction or removal efficiency performance test using EPA Method 25 or 25A is estimated to be about $19,000. The total cost for all 12 facilities to test their add-on control devices in a single year, plus one facility completing a retest to account for 5 percent of control devices failing to pass the first test, will be $247,000. The total annualized testing cost, including retests, is approximately $57,000 per year at an interest rate of 5.25 percent and an additional $6,000 in reporting costs per facility in the year in which the test occurs for the MCM source category. For further information on the potential costs, see the cost tables in the memoranda, *Estimated Costs/Impacts 40 CFR part 63 Subpart HHHHH Monitoring Review Revisions,* May 2019, and the *Economic Impact and Small Business Screening Assessments for Proposed Amendments to National Emission Standards for the Hazardous Air Pollutants for Miscellaneous Coating Manufacturing Facilities (Subpart HHHHH),* in the MCM Docket.

D. What are the economic impacts?

The economic impact analysis is designed to inform decision-makers about the potential economic consequences of a regulatory action. For the final rule, the EPA estimated the cost of becoming familiar with the rule and re-evaluating previously developed SSM record systems and performing periodic emissions testing at certain facilities with add-on controls that are not already required to perform testing. To assess the maximum potential impact, the largest cost expected to be experienced in any 1 year is compared to the total sales for the ultimate owner of the affected facilities to estimate the total burden for each facility.

For the final revisions to the MCM NESHAP, the 2019 equivalent annualized value (in 2018$) of the costs over the period 2020–2026 is $66,000, assuming a 3-percent discount rate and $73,000 assuming a 7-percent discount rate. The 43 affected facilities are owned by 27 different parent companies, and the total costs associated with the final amendments range from 0.000005 to 0.025 percent of annual sales revenue per ultimate owner. These costs are not expected to result in a significant market impact, regardless of whether they are passed on to the purchaser or absorbed by the firms.

The EPA also prepared a small business screening assessment to determine whether any of the identified affected entities are small entities, as defined by the U.S. Small Business Administration. Two of the facilities potentially affected by the final revisions to the MCM NESHAP are small entities. However, the costs associated with the final amendments for these two affected small entities range from 0.002 to 0.025 percent of annual sales revenues per ultimate owner. Therefore, there are no significant economic impacts on a substantial number of small entities from these final amendments.

More information and details of this analysis are provided in the technical document titled *Economic Impact and Small Business Screening Assessments for Proposed Amendments to the National Emission Standards for*

Hazardous Air Pollutants for Miscellaneous Coating Manufacturing (Subpart HHHHH), available in the MCM Docket.

E. What are the benefits?

As stated above in section V.B of this preamble, we were unable to quantify the specific emissions reductions associated with eliminating the SSM exemption.

Because these final amendments are not considered economically significant, as defined by Executive Order 12866, we did not monetize the benefits of reducing these emissions. This does not mean that there are no benefits associated with the potential reduction in volatile organic HAP from this rule.

F. What analysis of environmental justice did we conduct?

Executive Order 12898 (59 FR 7629, February 16, 1994) establishes Federal executive policy on environmental justice. Its main provision directs federal agencies, to the greatest extent practicable and permitted by law, to make environmental justice part of their mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority populations and low-income populations in the United States.

To examine the potential for any environmental justice issues that might be associated with the source category, during the proposal, we performed a demographic analysis, which is an assessment of risk to individual demographic groups of the populations living within 5 kilometers (km) and within 50 km of the facilities. In the analysis, we evaluated the distribution of HAP-related cancer and noncancer risk from the MCM source category across different demographic groups within the populations living near facilities.

The results of the demographic analysis are summarized in Table 4 of this preamble. These results, for various demographic groups, are based on the estimated risk from actual emissions levels for the population living within 50 km of the facilities. These results have not changed since the proposal.

TABLE 4—MCM DEMOGRAPHIC RISK ANALYSIS RESULTS

	Nationwide	Population with cancer risk at or above 1-in-1 million due to MCM	Population with chronic HI above 1 due to MCM
Total Population	371,746,049	3,665	0
White and Minority by Percent			
White	62	64	0
Minority	38	36	0
Minority by Percent			
African American	12	32	0
Native American	0.8	0.05	0
Hispanic or Latino (includes White and nonwhite)	18	2	0
Other and Multiracial	7	2	0
Income by Percent			
Below Poverty Level	14	29	0
Above Poverty Level	86	71	0
Education by Percent			
Over 25 and without High School Diploma	14	19	0
Over 25 and with a High School Diploma	86	81	0
Linguistically Isolated by Percent			
Linguistically Isolated	6	1	0

The results of the MCM source category demographic analysis indicate that emissions from the source category expose approximately 3,700 people to a cancer risk at or above 1-in-1 million and zero people to a chronic noncancer TOSHI greater than 1. The percentages of the at-risk population in each demographic group (except for African American, Below Poverty Level, Hispanic or Latino, and Above Poverty Level) are similar to (within 5 percent of) their respective nationwide percentages. The African American and Below Poverty Level demographic groups are greater than their respective nationwide percentages, while the Hispanic or Latino (includes White and nonwhite) and Above Poverty Level are lower than their respective nationwide percentages.

The methodology and the results of the demographic analysis are presented in a technical report, *Risk and Technology Review—Analysis of Demographic Factors for Populations Living Near Miscellaneous Coating Manufacturing Facilities,* available in the docket for this rulemaking.

G. What analysis of children's environmental health did we conduct?

The EPA does not believe the environmental health or safety risks addressed by this action present a disproportionate risk to children. This action's health and risk assessments are summarized in section IV.A of this preamble and are further documented in

the *Residual Risk Assessment for the Miscellaneous Coating Manufacturing Source Category in Support of the 2019 Risk and Technology Review Proposed Rule,* available in the docket for this rulemaking.

VI. Statutory and Executive Order Reviews

Additional information about these statutes and Executive orders can be found at *https://www.epa.gov/laws-regulations/laws-and-executive-orders.*

A. Executive Orders 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is not a significant regulatory action and was, therefore, not submitted to the Office of Management and Budget (OMB) for review.

B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs

This action is not expected to be an Executive Order 13771 regulatory action because this action is not significant under Executive Order 12866.

C. Paperwork Reduction Act (PRA)

The information collection activities in this final rule will be submitted for approval to OMB under the PRA. The information collection request (ICR) document that the EPA prepared has been assigned EPA ICR number 2115.07. You can find a copy of the ICR in the MCM Docket (Docket ID No. EPA–HQ–OAR–2018–0747), and it is briefly summarized here.

The EPA is finalizing revisions to the SSM provisions of the rule, requiring periodic testing of control devices, and requiring the use of electronic data reporting for future performance test data submittals, notifications, and reports. This information is being collected to assure compliance with 40 CFR part 63, subpart HHHHH.

Respondents/affected entities: Facilities manufacturing surface coatings.

Respondent's obligation to respond: Mandatory (40 CFR part 63, subpart HHHHH).

Estimated number of respondents: In the 3 years after the amendments are final, approximately 43 respondents per year will be subject to the NESHAP and no additional respondents are expected to become subject to the NESHAP during that period.

Frequency of response: The total number of responses in year 1 is 175, in year 2 is 46, and in year 3 is 85.

Total estimated burden: The average annual burden of the final amendments to the 43 MCM facilities over the 3 years is estimated to be 565 hours (per year). The average annual burden to the Agency over the 3 years after the amendments are final is estimated to be 116 hours (per year). Burden is defined at 5 CFR 1320.3(b).

Total estimated cost: The average annual cost of the final rule amendments to the MCM facilities is $65,000 in labor costs in the first 3 years after the amendments are final. The average annual capital and operation and maintenance costs are $82,000. The total average annual Agency cost of the proposed amendments over the first 3 years after the amendments are final is estimated to be $5,500.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations in 40 CFR are listed in 40 CFR part 9. When OMB approves this ICR, the Agency will announce that approval in the **Federal Register** and publish a technical amendment to 40 CFR part 9 to display the OMB control number for the approved information collection activities contained in this final rule.

D. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. The Agency has determined that two of the facilities potentially affected by the final revisions to the MCM NESHAP are small entities and may experience an impact of 0.002 to 0.025 percent of annual sales revenues per ultimate owner. Details of this analysis are presented in section V.D of this preamble and additional detail is provided in the economic impact memoranda associated with this action. We have, therefore, concluded that this action will have no net regulatory burden for all directly regulated small entities.

E. Unfunded Mandates Reform Act (UMRA)

This action does not contain an unfunded mandate of $100 million or more as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. While this action creates an enforceable duty on the private sector, the cost does not exceed $100 million or more.

F. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the National Government and the states, or on the distribution of power and responsibilities among the various levels of government.

G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications as specified in Executive Order 13175. No tribal facilities are known to be engaged in any of the industries that will be affected by this action (MCM). Thus, Executive Order 13175 does not apply to this action.

H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

This action is not subject to Executive Order 13045 because it is not economically significant as defined in Executive Order 12866, and because the EPA does not believe the environmental health or safety risks addressed by this action present a disproportionate risk to children. This action's health and risk assessments are contained in sections III.A, III.C, and IV.A of this preamble and are further documented in the *Miscellaneous Coating Manufacturing Risk Assessment Report,* in the MCM Docket.

I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This action is not subject to Executive Order 13211 because it is not a significant regulatory action under Executive Order 12866.

J. National Technology Transfer and Advancement Act (NTTAA) and 1 CFR Part 51

This action involves technical standards. Therefore, the EPA conducted searches for the MCM NESHAP through the Enhanced National Standards Systems Network Database managed by the American National Standards Institute (ANSI). We also contacted voluntary consensus standards (VCS) organizations and accessed and searched their databases. We conducted searches for EPA Methods 1, 1A, 2, 2A, 2C, 2D, 2F, 2G, 3, 3A, 3B, 4, 18, 21, 22, 24, 25, 25A, 25D, 26, 26A, and 29 of 40 CFR part 60, appendix A; 301, 305, 311, 316, and 320 of 40 CFR part 63, appendix A; 624, 625, 1624, 1625, 1666, and 1671 of 40 CFR part 136, appendix A; and 8260, 8260B (SW–846), 8270, Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, EPA Publication SW–846 third edition. During the EPA's

VCS search, if the title or abstract (if provided) of the VCS described technical sampling and analytical procedures that are similar to the EPA's reference method, the EPA ordered a copy of the standard and reviewed it as a potential equivalent method. We reviewed all potential standards to determine the practicality of the VCS for this rule. This review requires significant method validation data that meet the requirements of EPA Method 301 for accepting alternative methods or scientific, engineering, and policy equivalence to procedures in the EPA reference methods. The EPA may reconsider determinations of impracticality when additional information is available for particular VCS.

No applicable VCS were identified for EPA Methods 1A, 2A, 2D, 2F, 2G, 21, 22, 25D, 305, 316, 625, 1624, 1625, 1666, 1671, 8260, 8260B (SW–846), and 8270. The following VCS were identified as acceptable alternatives to the EPA test methods for the purpose of this rule.

The EPA is including in the final rule the VCS ANSI/ASME PTC 19–10–1981 Part 10 (2010), ''Flue and Exhaust Gas Analyses,'' as an acceptable alternative to EPA Method 3B for the manual procedures only and not the instrumental procedures. This method is used to quantify the oxygen and carbon dioxide concentration in exhaust from stationary combustion sources, and is available at the American National Standards Institute, 1899 L Street NW, 11th Floor, Washington, DC 20036 and the American Society of Mechanical Engineers (ASME), Three Park Avenue, New York, NY 10016–5990. See *https://www.ansi.org* and *https://www.asme.org.*

Additionally, the EPA is including in the final rule the VCS ASTM D6420–18, ''Standard Test Method for Determination of Gaseous Organic Compounds by Direct Interface Gas Chromatography-Mass Spectrometry,'' as an acceptable alternative to EPA Method 18 with the following caveats. This ASTM procedure employs a direct interface gas chromatograph/mass spectrometer (GCMS) to identify and quantify the 36 volatile organic compounds (or sub-set of these compounds) listed in the method, and has been approved by the EPA as an alternative to EPA Method 18 only when the target compounds are all known and the target compounds are all listed in ASTM D6420 as measurable. ASTM D6420–18 should not be used for methane and ethane because the atomic mass is less than 35; and ASTM D6420 should never be specified as a total VOC method.

The EPA is including in the final rule the VCS ASTM D2369–10(2015) el, '' ''Test Method for Volatile Content of Coatings;'' ASTM D2697–03 (2014), ''Standard Test Method for Volume Nonvolatile Matter in Clear or Pigmented Coatings;'' and ASTM D3960–98, ''Standard Practice for Determining VOC Content of Paints and Related Coatings,'' as acceptable alternatives to EPA Method 24 for determining the weight-percent HAP content of coatings, by determining the volatile matter or VOC content of coatings and use that value as a substitute for the mass fraction of HAP, for demonstrating compliance with the weight-percent HAP limit alternative in 40 CFR 63.8055. ASTM D2369–10(2015) el is used for calculating the weight percent volatile organic content in coatings and the weight percent solids content. ASTM D2697–03 (2014) measures the volume of dry coating solids in a given volume of liquid coating. ASTM D3960–98 is used for determining the VOC content of paints and related coatings and for calculating the VOC content expressed as the mass of VOC: (1) Per unit volume of coating less water and exempt volatile compounds, and (2) per unit volume of coating solids and (3) per unit mass of coating solids.

In addition, the EPA is including in the final rule-the VCS ASTM D6348–12e1, ''Determination of Gaseous Compounds by Extractive Direct Interface Fourier Transform (FTIR) Spectroscopy,'' as an acceptable alternative to EPA Method 320 of appendix A to 40 CFR part 63 with caveats requiring inclusion of selected annexes to the standard as mandatory. ASTM D6348–12e1 identifies and measures the concentration of organic compounds in an exhaust stream. The test plan preparation and implementation in the Annexes to ASTM D6348–12e1, Sections Al through A8 are mandatory; and in ASTM D6348–12e1, Annex A5 (Analyte Spiking Technique), the percent (%) R must be determined for each target analyte (Equation A5.5). In order for the test data to be acceptable for a compound, %R must be $70\% \geq R \leq 130\%$. If the %R value does not meet this criterion for a target compound, the test data is not acceptable for that compound and the test must be repeated for that analyte (*i.e.,* the sampling and/or analytical procedure should be adjusted before a retest). The %R value for each compound must be reported in the test report, and all field measurements must be corrected with the calculated %R value for that compound by using the following equation:

Reported Results = (Measured Concentration in the Stack × 100)/ % R.

The five ASTM methods (ASTM D2369–10(2015) el, ASTM D2697–03, ASTM D3960–98, ASTM D6348–12e1, and ASTM D6420–18) are available at ASTM International, 1850 M Street NW, Suite 1030, Washington, DC 20036. See *https://www.astm.org/.*

The EPA is including in the final rule the VCS CARB Method 310, ''Determination of Volatile Organic Compounds (VOC) in Consumer Products and Reactive Organic Compounds (ROC) in Aerosol Coating Products,'' as an acceptable alternative to EPA Method 311 for determining the weight-percent HAP content of coatings, by determining the mass fraction of volatile matter and use that value as a substitute for the mass fraction of HAP, for demonstrating compliance with the weight-percent HAP limit alternative in 40 CFR 63.8055. This method is used to determine the weight percent of VOC in consumer products and ROC in aerosol coating products and is available from the California Air Resources Board (CARB), 1001 I Street, Sacramento, CA 95814. See *https://ww2.arb.ca.gov/.*

Additional information for the VCS search and determinations can be found in the memorandum, *Voluntary Consensus Standard Results for National Emission Standards for Hazardous Air Pollutants: Miscellaneous Coating Manufacturing,* which is available in the docket for this rulemaking.

K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes that this action does not have disproportionately high and adverse human health or environmental effects on minority populations, low-income populations, and/or indigenous peoples, as specified in Executive Order 12898 (59 FR 7629, February 16, 1994) because it does not significantly affect the level of protection provided to human health or the environment. The documentation for this decision is contained in section V.F of this preamble and the technical report, *Risk and Technology Review—Analysis of Demographic Factors for Populations Living Near Miscellaneous Coating Manufacturing Facilities,* available in the docket for this rulemaking.

L. Congressional Review Act (CRA)

This action is subject to the CRA, and the EPA will submit a rule report to each House of the Congress and to the Comptroller General of the United States. This action is not a ''major rule'' as defined by 5 U.S.C. 804(2).

List of Subjects in 40 CFR Part 63

Environmental protection, Air pollution control, Hazardous substances, Incorporation by reference, Reporting and recordkeeping requirements.

Andrew Wheeler,

Administrator.

For the reasons stated in the preamble, the EPA amends 40 CFR part 63 as follows:

PART 63—NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SOURCE CATEGORIES

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 *et seq.*

Subpart A—General Provisions

■ 2. Section 63.14 is amended by:
■ a. Revising paragraphs (e)(1) and (h)(26), (30), (50), (86), and (94);
■ b. Redesignating paragraphs (k)(1) through (5) as paragraphs (k)(2) through (6); and
■ c. Adding new paragraph (k)(1).

The revisions and addition read as follows:

§ 63.14 Incorporations by reference.
